But how are we to sell land and prevent the longest purse from acquiring it? Having lived through many Australian land-laws, I feel like the cardinal who had "seen four-and-twenty leaders of revolt." They are all like one another, and all failures. The system of selling by auction, except to a small extent, has been universally abandoned. Practically, it is always worked by combinations of land-sharks, who intercept the profit of the state, and prefer the large land-owner as a customer to the small. Excluding auctions, the first idea was to throw open an area of 4,000,000 acres, which was never to fall below 2,000,000, for selections in small lots by persons bound to cultivate or improve up to a certain value. But as the state proposed to sell land worth £6 an acre for £1 to the small settler, need I say that the squatter first organized dummies, who were to take up land in their own names for him, and afterwards gradually bought out the bonâ-fide settlers? In fact, many a small farmer cannot do better than part with his first selection. During the three years' residence which the law compels before it gives him a title, he can pay his way by raising crops from a virgin soil, or by carting and wood-cutting; and at the end of the time he may easily make £1,000 profit on his cheap bargain with the state, and move off to a fresh selection in one of the neighboring colonies, or even, if he does not shrink from making a false declaration, in Victoria. Meanwhile, new land is being alienated every year from the state at a price far below its value; the number of genuine cultivators does not increase very rapidly; and a great proportion of the land sold notoriously passes into the hands of the men whose properties are already overgrown. Personally, I hold a strong view that the farming class in a new country must always be migratory. Where land is cheap and labor dear, it pays better to till for a short time, and then shift the homestead, than to stay on exhausting the soil or recruiting it by costly manures. I therefore view without dismay the shifting of our population, which creates and abandons townships with a happy facility, and believe that the cheapest way of tillage is provisionally the best, or at least that the state is not bound to promote scientific agriculture by legal enactments. But our present land-laws seem to me at once foolish and demoralizing. They have created a whole class that receives a large bounty for living in districts which it would not naturally choose, in order that at the end of three years it may go out of them again at a profit. Nor is it too much to say that those men are tempted to much dishonesty in the matters of residence and improvements, and are not likely to be the better for the three years of purposeless work or vagabondage which falls to their lot in the barren districts that would never be settled but for the law. Besides, the condition of residence bears hardly upon the large class in towns who would like to invest in and improve land, but who cannot live upon it away from their work. The new land-law Mr. Casey has introduced seems on the old lines and rather worse than its predecessors. To prevent the transfer of land, he proposes to withhold the titles till after thirteen years. This will certainly prevent the transfer, but it will also prevent settlement, as no small cultivator can hope to earn a living on land that he cannot mortgage. It is in fact a proposal to bind the farmer to the soil for a term of years. Next, a few acres outside the pastoral districts are to be thrown open to non-resident selectors. And lastly, in compliance with a very general wish that the crown lands should be leased or sold, so that the state may get the increased increment of value, a small experience in this direction is to be made with some of the river frontages near Melbourne. There are some minor provisions, good and bad, such as that licenses cannot be assigned, but these are points of detail on which I dwell the less, as I feel confident that every attempt to make the system

more artificial will only make it more defenceless against wealth and legal subtlety. I regard Mr. Casey's measure as a practical admission of defeat, and expect the land-question to take a new, a revolutionary form.

It may do so in one of two ways. Our most original politician here, Mr. Higinbotham, has given in a modified adhesion to the system I have alluded to of having all the crown lands sold. Mr. Higinbotham is a man of high character, acknowledged honest and honorable even by those who denounce him as a red republican, is the most genuine orator we possess, and is very popular. His one fatal fault is that he prefers the position of a free lance to that of leader of a party or lieutenant of an administration. Should he, however, decide on advocating his plan, I think it certain that it will at least receive a fair trial on a large scale. But the plan which at present captivates the popular fancy is undoubtedly one proposed by a very inferior politican, Mr. Woods, who desires to put a progressive tax upon land. Some of our mob orators have already carried this to the extent of proposing that the tax should go up a penny for every 1,000 acres, so that a man holding from one to two hundred thousand would practically be fined half or three-quarters of his income, even in the not very probable case that his land averaged a pound an acre in value. I have such confidence in the moderation and good sense of our people that I do not believe any extreme scheme of this sort will be listened to. But I think even moderate men are inclining to tax large properties at a rather higher rate than small. The question is whether a small differential tax would not induce our largest land-owners to bring their outlying properties into the market, or at least abstain from buying up fresh land. We could then abolish the system of bounties, and let the farmer select as he liked from the unsold crown lands at something like the market value, or at most with some facilities of deferring payment. Possibly this plan also may work badly or be evaded. Under any circumstances, I apprehend the land question will be the great problem of all the Australian colonies for many years to come.

## "THE ONE-MAN POWER."

To the Editor of The Nation:

Sir: Your editorial article in the *Nation* of 9th inst., on "The one-man power in finance," indicates your opinion, supported by several illustrations, that society in most or all of its subdivisions is subject to the same one-man power, whenever organized efforts are directed to accomplish anything. If this view is correct, is it not owing to natural laws governing mental forces, analogous to those that rule in gravitation, and therefore to be assumed as present and active in all associations of men?

The truth of this appears in all the walks and conditions of life. In any group of school children at play the controlling influence generally rests with one, or at most with two or three. In any board of trustees or vestrymen of a church, though they may have been elected by a pure democracy—that is, by the whole vote of the body they represent—yet in nearly all cases some one man will outweigh in efficiency all the others. If the representatives of any given denomination meet in state conference, or presbytery, or convention, and they deliberate in committee of the whole, they will, in any important matter, appoint a sub-committee, consisting of a few members, who embody the principal forces applicable to the measure; and when these retire to deliberate, the residuum of strength will be soon apparent in one of the number selected. The same is especially true of legislative bodies, whether State or national. The Speaker with care divides the House into a variety of committees; each committee is composed of men, in his opinion, having especial abilities for the particular interest; and the committee constitutes in large degree the strength of the whole body, when any measure within its supervision is taken up. This committee, in the meantime, will have practically concentrated its forces in one man, or at most one man to each political party represented.

We come therefore, in a sense, and in the sense in which your article is written, to a one-man power. Is there any escape from this in human affairs? and is escape desirable? Should not the weightiest reason, as well as the heaviest metal, have the most value? For the necessary evils growing out of this must not society find compensation in the value and brilliancy of its best men, thus formed by constant friction, and chiselled and polished in their several places? As a partial remedy for the damage that will result from an occasional explosion, like the one that forms the subject of your paper, you suggest, in regard to persons wielding the one-man power in finance, "even if it would be impossible to prevent their doing things, it ought not to be impossible to compel a report of them, and account for them after they have been done"; but in abatement of the value of this, you had already written, after noticing the necessary qualities that go to make up a man capable of this control:

"Anybody who has these qualities naturally makes his way to the front in all moneyed concerns, and naturally becomes president or cashier; and the directors trust him because they know he is abler than they are, and because in nine cases out of ten they would be incompetent to criticise his course. If they were competent to criticise it, they would be his equals; but they are not, and they know it, and they know that no statement he could make to them of what he proposed to do, and his reasons for doing it, would make them wise enough really to supervise him."

The difficulty could hardly be better stated; but if his own directors, men who own the interest in his charge, and who have selected and employed him, cannot, and cannot be made to understand him, will his report to the public be generally understood, and tend to correct his measures? In view of your quotation from the London *Economist*, showing that London bankers regard the one-man power in finance as the least of two evils, and the probable fact that all or nearly all the banks in your own city and throughout the country rest largely on the management of one man to each, and the fact that all human interests, when committed to organized numbers of men, appear to take life and action from some one of the number, is it not probable that there exists a law of our congregate being that, irrespective of the number that deliberates, all other counsel must give way to the best counsel, and of necessity the best counsel will be the thought of some one of the number? Sometimes the single voice of this best counsel is heard from among the people outside of legislative halls and government cabinets, and then it becomes, as quoted by John Bright from an old poet:

"A yet auguster thing
Than parliament or king."

This may be a law of the "survival of the fittest," or it may rest on the maxim that "Providence favors the heaviest artillery."

Henry W. Lord.

Pontiac, Mich., Sept. 13, 1875.

[The director might not be competent to criticise a bank president's general management, any more than the public is competent to criticise a judge's reasons for his decision; but this is only true within certain limits, and with regard to things plainly legitimate. If a judge were grossly corrupt, and decided a case without any show of authority, to oblige a friend, his opinion would be sure to expose him; the simple judgment would not. So, also, if a bank president made loans without security, or to persons without credit, or took the money himself, and had to tell all about it, no director would feel that he needed to be a great financier in order to condemn him. Under the present system, the bank manager begins by operations which are legitimate but abstruse, and the immunity from criticism which he enjoys on them tempts him at last into operations which are wholly illegitimate and by no means abstruse. We do not mean to say that the problem is easy of solution, because of course directors have to treat the president as if he were an honest man, and therefore shrink from precautions implying doubts of his integrity.—Ed. Nation.]

## THE PIKE CO. LEVEE BONDS.

To the Editor of The Nation:

Sir: I have had great satisfaction in reading your various articles and comments on the "Holy Farmer" of the West, and write this merely to give you a little of my personal experience in the matter of the Pike County levee bonds spoken of in your last issue.

I am so unfortunate as to be a "bloated" holder of those bonds to a limited extent, and know whereof I affirm when I say that, despite all the legal and constitutional provisions for their safety so vigorously set forth by Mr. Marcy in the *Tribune*, the coupons due last July on the *first issue* of bonds have not yet been paid. I understand a *few* were paid, possibly for the interest of the brokers who have yet to dispose of more of these "securities for trust funds." The bonds may be valid and sound, according to Mr. Marcy, but I had always supposed one element of "soundness" in bonds to be the payment of maturing coupons.

I don't write this to be published, even if you had any inclination to do

so. I only wish to let you know that your remarks on the attitude of the Farmer-Baron toward these levee bonds is as you stated.—Very respectfully,

SEPT. 12, 1875.

[Our correspondent seems to forget the long and grinding oppression undergone by the Farmer at the hands of the owners of money and goods. These unpaid coupons are only a small instalment of what has been wrung from him by bankers, piano-men, pork-men, booksellers, publishers, tailors, hatters, blacksmiths, shoemakers, and common carriers. They have all levied "toll" on him. He is now trying to get some of it back out of somebody. The more one watches his efforts to save himself, the deeper the depravity of the railroad men appears.—ED. NATION.]

## RAG-MONEY ARCHITECTURE.

TO THE EDITOR OF THE NATION:

SIR: Allow me to call your attention to the work now going on in the Boston Post-Office building; for, although of no great consequence, it is yet not without interest, as an instance of the way in which Government work is sometimes done. The floors and foundations of the U. S. Treasury vaults are being strengthened, to enable them to hold the silver now accumulating; for, as originally built, they were only capable of containing currency.

Now, Mr. Editor, if gold and silver coin were new inventions, made in the year 1875, this might be easily understood; but, under existing circumstances, does it not argue on the part of the Government architects a degree of incompetency rather surprising in "the best civil service on the face of this planet"? A CONSTANT READER.

BOSTON, Mass., Sept. 8, 1875.

# Notes.

THE first volume of the translation of the Comte de Paris's 'History of the Civil War in America,' in preparation by J. H. Coates & Co., Philadelphia, will embrace the first two volumes of the original.——Jas. R. Osgood & Co.'s fall list includes a large number of new editions, and the following noticeable new works: 'The Masque of Pandora, and other poems,' by H. W. Longfellow; 'Home Pastorals,' by Bayard Taylor; 'Songs of Three Centuries,' selected by J. G. Whittier; 'Victorian Poets,' by E. C. Stedman; 'The Bird and the Bell,' poems by C. P. Cranch; 'Rose and Rooftree,' poems by G. P. Lathrop; the second series of Prof. Lowell's 'Among My Books'; a volume of essays by R. W. Emerson; 'Saxon Studies,' by Julian Hawthorne; a 'Life of George Ticknor,' by Geo. S. Hillard; an 'Art Romance,' by Harriet Hosmer; and Mr. Henry James, jr.'s 'Roderick Hudson.' The following works will all be more or less profusely illustrated with heliotypes: Justin Winsor's 'Shakespere Bibliography,' already described by us; Viollet-le-Duc's 'Discourses on Architecture,' translated with notes by Henry Van Brunt; "Famous Painters and Paintings," by Mrs. J. H. Shedd; 'The History of Independence Hall, Philadelphia,' by Col. Frank M. Etting; 'Poetic Localities of Cambridge,' views of scenes and places made famous by Lowell, Holmes, Longfellow, etc.; and 'A Farmer's Vacation,' by Col. Geo. E. Waring, jr.——Macmillan & Co. have in hand a new edition of Jowett's 'Plato' in five volumes instead of four. The translation has been thoroughly revised. They will also publish an account of the two abortive British expeditions to Western Yunnan, commanded respectively by Major Sladen and Colonel Browne, by Dr. Anderson, Director of the India Museum, Calcutta. He accompanied the second expedition, in going to meet which Mr. Margary was murdered by the Chinese.——Some other English publications, announced as forthcoming shortly, are the following: a History of Prussia, in eight volumes, by Capt. Wyatt; 'Myths and Songs of the South Pacific,' by the Rev. W. W. Gill; 'The Correspondence, Table-Talk, and Memoirs of Benjamin Robert Haydon,' by his son, F. W. Haydon, which will be illustrated in a very interesting manner with portrait sketches; a work on Currency, by Prof. Bonamy Price; 'The Great Divide,' being the Earl of Dunraven's travels in the Upper Yellowstone in 1874, illustrated by his companion, Mr. V. W. Bromley; 'Spitzbergen and Novaya Zemlya, with the adjacent Seas,' by Mr. James Lamont; and—a work which should claim the attention of architects—a series of autotype views of some of the ancient halls of Lancashire and Cheshire, with descriptions by Mr. James Croston.

—In *Lippincott's Magazine* for October, Dr. Francis Wharton's paper on "Spiritualism and Jurisprudence" will be sure to attract a large number of readers by its very title. Every sincere believer in spiritualistic phenomena has an interest, which ought to be more than a languid interest, in bringing to punishment impostors who practise mere jugglers' tricks in binding and loosing themselves in dark cabinets, or Katy-King materializations, or who cook the negatives of their "spirit photographs," or, with a coarser deception, produce rappings, counterfeit trances, and deliver conscious "messages" for pay. But Dr. Wharton puts these knaves out of the question, since there is clearly law enough for them if their imposture can be proved. He imagines such extreme cases as "if A, instead of making a table move from one end of the room to the other, make a purse move out of B's pocket without B's consent"; or "if A, instead of compelling B to float in the air, should compel B to commit a crime." And he then asks: "What attitude is jurisprudence to assume towards a person who, charged with an invasion of the laws of the land, sets up as a defence that he was acting under the constraint of a superior spiritual power? What attitude is jurisprudence to assume towards those who exercise such power for an illegal end?" This, it will be seen, involves the whole class of so-called mediums; for if it may be said that spiritualism has very few recorded instances of purse-"lifting," and probably fewer of incitement to crime than any religion equally diffused, still it is possible that (1) in consequence of mediumistic communications a person may injure himself, or (2) a medium may acquire such a control over a person's will as to cause him to injure himself or others. In either case, Dr. Wharton has no doubt that the medium is legally responsible for the consequences. The practical value of this opinion depends somewhat on the frequency of the occurrence, say, of a believer's going mad or killing himself under the supposed direction of the spirits, or alienating his property to the profit of the medium or the disadvantage of his natural heirs. Do such things really happen, and happen often? And if they do, can the consequences easily be discriminated from those which happen every day by reason of religious exaltation or depression due to preaching, or of priestly influence in determining how much of a man's goods he shall leave to the Church? Pleasant or unpleasant as the idea may be, a considerable amount of men's actions is wisely or unwisely determined by spiritual direction; how much can of course never be known. Thus far jurisprudence has had very little to say on the subject. Perhaps a chance is in store for it if, as we have been told, the fresh flowers showered down at some of the séances are not cut but torn off—a fact which would lead to the inference that some neighboring greenhouse had been robbed. But then, how is the law to catch the offender? We ought, perhaps, to point out a little question-begging in Dr. Wharton's definition of spiritualism as "the alleged power to suspend ordinary natural laws, without any motive consistent with the divine economy." We doubt if such a power is ever "alleged," or that we know what motives are or are not "consistent with the divine economy."

—In *Harper's*, the portraits which accompany Mr. Junius H. Browne's "Parisian Journalists" fall a good deal short of the current photographs of the subjects. Best of all the illustrations in this number, if we except a curious view of the Falls of St. Anthony from an old engraving, are those which accompany Mr. Conway's second article on the South Kensington Museum. One paragraph from his interesting description has a special application for us, and will bear reproducing:

"Various public men sent their treasures to the Museum in its earlier days, when they were more needed than now; but it has been found necessary to select fastidiously from the too numerous articles offered every year as loans. Many families owning valuable collections find it difficult to keep them in perfect safety, and more begin to realize that such articles should not be of private advantage. Some collections, originally received as loans, it is pretty certain will never be removed; and I am assured by the director that the Museum has been notified of being remembered in many wills. This gentleman, Mr. Cunliffe Owen, and his predecessor, Mr. Henry Cole, said to me, in conversation about the prospect of building museums in the American cities, that they had no doubt such institutions, if good and safe buildings were erected, would there as well as here find themselves centres of gravitation for the art treasures and curiosities owned by the community around them."

The twelfth paper on "The First Century of the Republic" is by Dr. Woolsey, and treats of "the experiment of the Union, with its preparations." It is a calm and serious survey of the elements which made an American nation possible and necessary on this continent, the causes which led to the revolution known as the civil war, and the tendencies which now make every lover of his country if not highly anxious at least sober and thoughtful. Dr. Woolsey's manifest intention to preserve a judicial impartiality, and to make his review as impersonal as possible, lends the greater significance to his re-

mark that "since the war the disturbed condition of one of the Southern States has induced the President, on his own responsibility, to use military power in a case of very doubtful constitutionality to say the least, and to interfere for the restoration of order in a way that cannot be justified." He adds that he does not mean to question "the upright intentions of the Chief Magistrate." While depicting the dangers of the reaction against the Southern doctrine of States-rights, he admits that it would be desirable if consolidation should so far take place, either by State agreement or a change in the Constitution, that uniform laws should prevail in regard to marriage, legitimacy, divorce, bequests, guardianship, the rights of married women, and the rights of aliens. That suffrage will ever be any less universal in this country than it is at present he does not venture to hope, though perhaps he despairs too easily. If there is any omission in this retrospect, it seems to us to lie in not pointing out the relations of a protective tariff to the corruption of our legislatures and of our civil service. Its complication with the slavery question was also worth a mention in passing.

—The *Portfolio* for September (J. W. Bouton) is a good but not a remarkable number, though the photogravures—after a landscape by Jacques and a drawing of Karl Dujardin's—are uncommonly successful; the "Jacques" has less the look of an effete mezzotint, and keeps more of the force and body of a strong oil-painting, than do most examples of the style. The large etching is by Brunet-Debaines after a Venetian scene of Turner's, and is a strong, rapid sketch of a picture excelling in subtle finish, resembling an effort to report in ten words a diffuse rhapsody. It is noticeable that the French etcher, in copying Turner's groups of figures, is quite unable to attain his peculiar boneless innocence of anatomy, and makes good suggestions of artistic forms instead of the soft limbs of a Turnerian crowd. The letterpress includes a neighborly review of the French journal *l'Art*, and continuations of Mr. Hamerton on Etty and Mr. Atkinson on Wiertz.

—In Petermann's *Mittheilungen* for July 5 may be found an original map, by Dr. Schweinfurth, of Dar-For, Egypt's new acquisition, which lies between Kordofan on the east and Wadai on the west. Its immediate neighbors on the southeast are the Dinkas or Denkas. This pastoral White-Nile tribe, as readers of Schweinfurth will remember, is a very interesting one and considerably advanced in manners. Their cookery is nice, their taste fastidious, and their eating very decorous. For the sake of making their hair straight, the men resort to much combing, and to malodorous washes and pomades which, as cattle-breeders, they find both cheap and tolerable. They think clothing was invented for women only. As long ago as 1853 they were made the objects of an Italian mission, with which went out a Veronese priest named Giovanni Beltrame. He employed his leisure between conversions in studying the language of the Dinkas, and in the course of nine years had accumulated with great difficulty the rough materials for a grammar of it. Returning to Europe in 1862, he was able in 1866 to consult Prof. Mitterutzner's 'Brief Grammar, Text-book, and Dictionary of the Dinka Language' (Brixen), and in 1870 he brought out his own ('Grammatica della Lingua Denka,' Florence). Quite recently he has been engaged in extracting some idea of their language from the two children of the dwarfish tribe of Akkas whose arrival in Europe excited so much interest among ethnologists. The Dinka language is monosyllabic but regular, and is completely equipped with all the parts of speech. Beltrame's reviewer in the *Perseveranza* quotes an ancient song of the Dinkas which can but increase one's respect for their intellectual capacity. It runs thus:

"In the days when God created all things he created the sun, and the sun is born, dies, and returns again; the moon too he created, and the moon is born, dies, and returns again; he created the stars, and the stars are born, die, and return again. Man created he, and man is born and dies, but returns no more."

—A correspondent writes us as follows:

"In the *Nation*, No. 530, final sentence of a notice of a German criticism of Bancroft, is a reference to the difficulty of rendering in English the word *Tendenz*. Permit a hesitating questioning, on the part of one who has no special claim to be heard on the subject, whether the equivalents there suggested may not be improved on. *Bias* is vague, is unconscious, and has no end in view. *Purpose*, of course, is conscious, but is very general, and does not define its aim. *Preconceived theory* is also conscious, but it may exist without any intention of carrying it out, any application of it to facts, and the fashioning of them in presentation. The writer having occasion to use an English equivalent for *Tendenz* adopted at first *doctrinal drift*, or *doctrinal aim* (preferably the latter), as expressing the idea of a conscious and definite purpose to shape subject-matter in the interest of a particular view, which is what he understands to be the notion denoted by *Tendenz*. Lately, he came upon Dr. Schaff's rendering, which he considers still better (the difference being, however, more in form and in a certain suggestiveness than in actual meaning), *dogmatic design*. There is another word of which German critics seem to be fond, and to which they give a special sense that seems likewise hard to catch. It is the word *Moment* (not the masculine noun, denoting a period or a force, but a neuter). C. F. Baur, for instance, speaks of an idea which is to be regarded *nur als ein verschwindendes Moment* of a *Tendenz*. What is the best English equivalent? Do *aspect*, *phase*, *advancing stage* convey it? Or if they do not, can an improvement be made upon them?"

As we understand it, *Moment* as used by the Germans means *motor element*, or *dynamic factor*. A simply constitutive element or component is a *Bestandtheil* of the result; but where the result is itself a process or a dynamic effect, its component forces are "momenta." Thus oxygen and iron are *elements* of iron rust, but the presence of moisture is an important *Moment* in its production from them. In the phrase from Baur quoted by our correspondent, the context alone can decide whether *phase*, *aspect*, or *factor* would be the best translation. If phase, then the author has glanced off from the dynamic to the temporal meaning of the word, which is also familiar in German. Both *verschwindendes* and *entscheidendes Moment* are very common phrases, and are partly paralleled in English by the expressions, "a matter of little moment," "enterprises of great pith and moment." Philosophers in English often use the word as the Germans do, and speak, for instance, of discriminating the *momenta* of an argument. It is probable, however, that either "element" or "factor" can nearly always be used satisfactorily where a German would say *Moment*.

—The much-discussed question of the condemnation of Galileo for holding to the Copernican theory of the revolution of the earth has been gone over afresh in the last number of Sybel's *Historische Zeitschrift*, by F. H. Reusch. He shows that the judgment was not for belief in the theory, but for discussing it as an open question. In the first process (1615), Galileo, who was a believer in the Copernican theory, but also a zealous Catholic, submitted his will to that of the church, and promised not to promulgate or discuss the doctrine in future. In 1632, however, encouraged by the long lapse of time, and by his friendly personal relations with the liberal Pope Urban VIII., he published a dialogue, in which the Copernican and Ptolemaic theories were discussed by the respective interlocutors—professedly without any expression of opinion on the author's part, but of course with a great preponderance of argument on the side which he himself believed. This led to the second process and to his condemnation, with the vexatious surveillance under which he lived the rest of his life. The writer pronounces the famous story that, at the time of his recantation, he ejaculated to himself, "Eppur si muove" (it moves for all that), not only false but impossible. The entertaining text, however, taken by the monk who first preached against him—*Viri Galilaei, quid statis aspicientes coelum?*—appears to be genuine.

—Students of military affairs who are not indifferent to the progress of semi-civilized nations in the art of war, will be interested in Mr. Edward H. House's clear and minute account of the 'Japanese Expedition to Formosa' (Tokio, 1875). Mr. House accompanied this expedition as a correspondent of the *Herald*, in which paper the earlier chapters of his work mainly appeared as letters. The military operations in Formosa, though difficult enough, were on too limited a scale to deserve an historian; but the circumstances under which they were determined on and executed—the nice questions of national domain and international law—the foreign diplomatic intrigues by which China profited, and the direct negotiations, in which she finally yielded to Japan at every point—made the expedition an important landmark in Eastern development. Mr. House is an unqualified admirer of the Japanese, and finds them on all occasions wise, moderate, and firm; right in their motive and right in fact; humane to their enemies, courteous to everybody. If this were not true, it would still be plausible, since, rather than make war on Japan, China expressly justified Japan's actionin Formosa, and paid the costs of it. But a Chinese historian might still have something to say. Mr. House describes the Japanese soldier as "a Sybarite compared with the average European man-at-arms." He neither builds his own shelter, digs in the trenches, nor cooks his own food. All this is done by coolies, who bring him his meals in his tent. The Japanese rations are "extravagantly profuse," and include beer and spirits; and for the soldier's comfort when off duty, "he was supplied with loose cotton robes and straw slippers, which were issued to all upon demand." "In ornamental 'drill' the Japanese are perfect"; but "they have never been able to accustom themselves to the lower details of military routine," so that, for example, their disembarkation of troops and stores "was not accompanied with anything approaching to order or regularity." On the other hand, the irregular way in which a Chinese frigate returned a salute of twenty-one guns was noticed by the Japanese with much compla-

cency, and subsequently, on the landing of some Chinese commissioners, they "were received by a body of soldiers variously attired and accoutred, so as to represent the military system of past years as compared with that of the present day. It is not impossible," adds Mr. House, "that an indirect moral was intended to be pointed by this peculiar display." The courage of the Japanese appears from this narrative to be beyond dispute, and one incident is mentioned in which fortitude vied with courtesy. Mr. House was making the return march with very bad feet when it occurred :

"Several wounded soldiers were carried by me in litters, most of them lying at full length and speechless. One, however, was sitting upright, his injuries being such as to make that position the least painful to him. His arm was shattered and the flesh of his breast was torn away. Seeing that I was limping along with an extremely awkward gait, he stopped his carriers and asked what was the matter. I told him that my feet had been bruised and cut, whereupon he insisted that I should throw away my useless shoes and take his cloth socks and sandals. 'You see,' he said, 'I have no use for them now.' This was from a man who, while suffering from two dreadful wounds, spoke in the brightest tone, and smiled as cheerfully as if he had lain on a bed of roses."

## STRAUSS'S VOLTAIRE.*

VOLTAIRE was born in 1694, nine years after the revocation of the Edict of Nantes. He died in 1778, eleven years before the Convocation of the States-General. His life thus covered the greater part of a century, and during the last fifty years of his life he was the sovereign of European opinion. No literary man, either before or since his time, has exercised anything like his sway. His power further increased as his life went on, and was equally great with all classes of society. His last visit to Paris was a scene of triumph. Statesmen and philosophers hailed him as their guide and teacher ; polite society caressed him as the most brilliant of wits ; and the populace, who are usually indifferent to philosophic fame or literary reputation, worshipped him as a hero and deliverer. Nor was it enthusiasts alone who shared this idolatry. When Franklin brought his grandson to receive a blessing from the patriarch in the name of "God and Liberty," he expressed the veneration felt for the genius of Voltaire by many of the best and wisest thinkers of the age. Modern students find it difficult to understand the moral causes, at least, of Voltaire's power. He is known to them chiefly as a reckless scoffer, whose life was spent in waging an envenomed war with all the dogmas of Christianity, and a scoffer who was wanting in the dignity and self-restraint which are naturally demanded from a philosopher or reformer. His wit, indeed, is known to every reader by tradition; but in England and America his works are but little studied, and the witticisms which have impressed themselves on popular memory are often merely epigrammatic expressions of hatred to religion or theology. The six lectures in which Strauss has, under the form of impartial biography, put forth one of the most dexterous apologies for the career of the great freethinker, will enable persons unacquainted with Voltaire's works to appreciate the unparalleled cleverness and ability which constitute the intellectual sources of his might.

But it may be doubted whether Strauss makes plain to ordinary Englishmen or Americans the moral causes of Voltaire's success. Whoever wishes to understand not so much what Voltaire actually was as what he seemed to his contemporaries, should read with care the life in which Condorcet has embodied a disciple's admiration for his master. The book is a charming summary of Voltaire's life, and forms the foundation on which both Strauss and Mr. Morley have erected their more pretentious works. It has the defects which are inseparable from uncritical eulogy, but it breathes the spirit of the eighteenth century, and betrays, as it were, unconsciously the secret of Voltaire's strength. The grace of the following sentences vanishes under the awkwardness of translation, but though their form be spoilt their substance remains full of instruction for all persons who wish to understand Voltaire and his age :

"From the moment [of his return from England] Voltaire felt himself called to destroy the prejudices of all kinds of which his country was the slave. He perceived the possibility of success. He determined to employ a happy mixture of daring and pliancy, knowing how at one moment to yield to the times, at another to profit by opportunities or to create them. In carrying out his scheme, he resolved skilfully to use by turns now argument, now wit, now the charm of verse, and now the effects of the theatre, so as to render reason so clear that it might become popular, so amiable as not to frighten frivolity, and so amusing as to be the fashion. This grand idea of becoming through the mere resources of his genius the benefactor of a whole people, by delivering them from their errors, fired Voltaire's soul and heated his courage. To this task he swore to consecrate his life, and he kept his oath."

Voltaire, that is to say, was in the eyes of his generation the apostle of "enlightenment," and belief in enlightenment was the faith of the age. Any one who fails to perceive this fails to understand the eighteenth century. That epoch has been termed an age of incredulity and of scepticism. It might with far greater cause be described as an age of unbounded faith in the power of common sense. This faith is utterly foreign to the sentiments, good and bad, of the nineteenth century. The very terms in which it was expressed, such as, for example, "enlightenment," "age of reason," "enlightened men," "overthrow of prejudice," and so forth, have ceased to have much meaning for the present generation, but the faith in enlightenment was, while it lasted, as genuine, as great, and as influential a creed as any which has ruled mankind. Voltaire, with all his defects, meannesses, and vices, was throughout his life the consistent and unhesitating preacher of this creed. It is easy enough to point out features in his career and character which do not admit of defence or palliation, but neither friend nor foe doubted that Voltaire, in spite of all his tricks, his lies and stratagems, burnt with sincere zeal for the spread of enlightenment, and with even more sincere zeal for the destruction of prejudice. It would be equal folly and dishonesty to deny that Voltaire and his school included under the term prejudice beliefs which have survived all the fury and venom of their attack. This is not the place to discuss the theological and religious problems which it would be necessary to consider were we called upon to enter into the controversy between Voltaire and the orthodoxy of his age. One point, however, which concerns history rather than theology, deserves notice.

Two circumstances excited in the minds both of Voltaire and of his contemporaries a hatred if not to religion yet certainly to all theological dogmas, which can hardly be shared even by the most heterodox of modern thinkers. The first cause of hatred was that in France, and over the greater part of the continent, priests and theologians were as a matter of fact the opponents of every kind of rational progress. A second and even deeper cause of dislike to theology is to be found in the still vivid recollection of all the misery and the suffering, the physical and moral evil, which wars and persecutions carried on in the name of religion had brought upon Europe. The rule of the Puritans made the name of religious enthusiasm hateful even to pious Englishmen for more than a century. The tradition of the Reign of Terror still causes educated Frenchmen to tremble at the name of a republic. But the austerity of the Puritans and the cruelty of the Terrorists did not cause the world one tithe of the misery which was associated in the thoughts of Voltaire and his friends with the massacre of St. Bartholomew, the revocation of the Edict of Nantes, or the prolonged horrors of the Thirty Years' War. When Condorcet writes, "The blood of many millions of men massacred in the name of God still steams up to heaven around us. The earth on which we tread is everywhere covered with the bones of the victims of barbarous intolerance," he expresses in rhetorical language the feelings of a generation who knew by experience all the evils which flow from religious fanaticism, and did not know how great were the evils which might be produced by the fanaticism of men who had been trained up to look upon religion as their foe.

If Voltaire's assaults on Christianity have rendered him odious in the eyes of all who value religion, another feature of his creed, which is also closely connected with his belief in enlightenment, has estranged from him the sympathy of modern democrats. There is no concealing the fact that he was, in common with the *philosophes* of the age, indifferent to political liberty. He believed, whether rightly or not, that the spread of enlightenment, the diffusion of general knowledge, the establishment of universal toleration, the cessation of wars, the gradual prevalence of milder manners and of humane laws, would result in the destruction of all kinds of oppression, and give mankind, if not political rights and privileges, all the benefits which make political rights of real value. "The more enlightened men become the greater will be their freedom." This is not the maxim of a leader who intends to introduce a political revolution. It is a very natural maxim for a teacher to propound who had seen great reforms carried out by despotic sovereigns, and acts of the grossest injustice supported by the prejudices and violence of an ignorant mob. Modern experience shows that freedom from political oppression must often precede the spread of enlightenment and education, and Voltaire, it may be conceded, underrated the moral benefits of liberty ; but if he failed to see that no great reform could be carried out in France without a political revolution, he certainly perceived the fact which not only revolutionists but moderate liberals have often failed to grasp, namely, that no merely political change, no establishment of national independence, no cunning device by which every man is to be assured an equal share in the suffrage, will ever secure either freedom or good government for a people who cannot shake off the bonds of ignorance, of prejudice or superstition. Voltaire's scheme of reform was by no means

*'Voltaire. Sechs Vorträge von David Friedrich Strauss.' Leipzig. New York: B. Westermann & Co.

perfect, yet posterity may rationally regret that the inevitable revolution in France was guided by men who were the disciples, not of Voltaire, but of Rousseau.

Voltaire, moreover, though he underrated the value of political rights, certainly estimated at its full worth the blessing of individual freedom ; and if he was wanting in enthusiasm for liberty, he felt more strongly than perhaps any other man of his time the noblest of all passions—the hatred of injustice. Voltaire's character has its mean, hateful, despicable aspects ; but any one who reflects on the time, labor, and zeal which he expended on attempts to avert, to remedy or avenge, acts of injustice and oppression, must admit that his character had at least one heroic side. He saved the family and cleared the reputation of Calas. He held up to the hatred of Europe the torturers and murderers of De la Barre. If it be said that in these cases he attacked oppression because the wrong was done in the name of religion, it may surely be replied that of all acts of injustice those done in the name of religion are the most hateful in the eyes of man and God. But Voltaire opposed lay no less vehemently than ecclesiastical injustice. He was as ardent on behalf of Lally as on behalf of Calas, and his sympathies were not confined by the limits of his own country, for he exerted himself, unfortunately without effect, to avert the condemnation of Byng. It was this love for justice which seized hold of the imagination of crowds who had not read his works and would hardly have understood the arguments and the sarcasms by which he won the admiration of society. The poor woman who, when asked why she pressed through the crowd of Paris to get near Voltaire, gave as her answer, "He is the man who saved the family of Calas," paid a tribute to the highest part of Voltaire's nature, and her words still explain, in part at least, the influence over good and wise men of a teacher who, with all his faults, might well seem to them a hero and deliverer engaged in a contest with the injustice of the magistracy and the intolerance of the priesthood of France.

*The Duke and the Scholar, and other Essays.*—By T. L. Kington-Oliphant, M.A. (New York : Macmillan & Co. 1875.)—Readers of French literature during the last thirty years have often encountered the name of the Duc de Luynes as of a person at whose expense this or that splendid literary or archæological enterprise has been carried forward, and have received an impression that, in a shadowy fashion, the tradition of Mæcenas and of Cosmo de' Medici was still preserved. Visitors to the National Library in Paris will not have forgotten the magnificent collection of medals and bronzes in rooms inscribed with the Duke's name, and how they wondered at the wealth which could afford to gather it, and then could afford to part with it. Mr. Kington-Oliphant offers us here a short biography of this generous nobleman, in which his claims to the gratitude of historical students are set forth in detail. This memoir is mainly translated from a notice of the Duc de Luynes published by a modest but exemplary scholar who worked largely under his encouragement—M. Huillard-Bréholles, of whom also Mr. Kington-Oliphant gives an interesting account. The Duc de Luynes combined many attributes which are not often found together, and which, when they concur, seem the justification of a patriciate. He not only had the means for disinterested research, but he had an enlightened curiosity and a scrupulous scientific conscience. What he desired was not to patronize learning in a striking way, but in a way for which the truly initiated, the modest toilers, would be grateful. He belonged to a type of nobleman which is seen perhaps less frequently in France than in England, but which is not common anywhere. He was that rare phenomenon, a rich scholar, and he not only encouraged good work in others, but he produced it himself. Mr. Oliphant, himself an historical student, and in a position to appreciate the Duke's services to certain periods of history, enumerates his publications, researches, collections, antiquarian expeditions. He was born in 1802 ; he died in 1867. He was at most points a liberal Conservative, in others a narrow one. He was an uncompromising enemy of Italian unity ; he voted in the French Assembly, in 1848, for the scandalous interference of the Republic in Roman affairs, and he subscribed largely to equip the Papal army at the time of the resistance to Garibaldi in 1867. He was at Rome during the battle of Mentana, and died there shortly after this event. Nothing is more difficult for the Anglo-Saxon mind, in general, than to find tolerance for the French intolerance of the desire of Italy to regulate her home-conduct as she chooses, and it is a good deal to say for M. de Luynes that the English reader forgives him his want of generosity on this particular point in consideration of his usual breadth of view. He had not even the excuse of being, in faith, a positive Catholic. It may be said, however, that his attitude in this matter was not characteristic ; it was an inconsistency. He was a Legitimist, but not a bigoted one, and he possessed that agreeable attribute of many Frenchmen of rank—an "admiration for English institutions." The historical period on which he bestowed most attention was the Thirteenth Century—the struggle between the Popes and the Hohenstaufens. In illustration of this time, and of mediæval history generally, he caused a vast number of records and chronicles to be laboriously edited and published, monuments to be copied, maps to be drawn up. He promoted the researches of both French and Italian scholars. He was an ardent archæologist, and he published many papers on special topics—antique sculpture, coinage, pottery, inscriptions. He was a first-rate linguist, as the title of one of his essays—"The Coinage of the Satrapies and of Phœnicia under the Achæmenian Kings"—may testify. Into these matters he dived deeply. When discovery was made at Beyrut in 1855 of the Sarcophagus of Esmunazar, King of Sidon—a vast sepulchre of black basalt, the disinterment and transport of which were a great achievement—he immediately secured it and presented it to the Louvre. It was covered with a Phœnician inscription, upon which two German specialists instantly fell to work ; but the Duke puzzled it out before them, and published his translation. In 1865 he went to the East, and made an exhaustive exploration of Palestine. He had lavishly restored and decorated his ancient residence of Dampierre, and Mr. Oliphant gives an entertaining account of a curious episode in this process—the painting by Ingres of two frescoes in one of the apartments. The Duke was to pay him 70,000 francs. The work was begun in 1843, and in 1850 was not finished, owing to the venerable artist's extraordinary caprices and coquetries. It was finally abandoned, and now blushes unseen behind velvet curtains. The Duc de Luynes was a man of the highest private morality, was personally very shy, and was considered stiff and cold. "In private, however," says Mr. Oliphant, "he was the gayest of the gay. If some friends told him a merry tale, seasoned with a little Gallic salt, he would half-shut his blue eyes, open his large mouth, and give way to a hearty laugh." Fortune had given him many of the things that excite envy, but he himself had added to them only the things that excite respect.

Among the works of learning executed at the Duke's expense was a translation of the chronicle of Matthew Paris, in nine volumes. Another and a greater was a collection of all the surviving documents, charters, memorials, and letters connected with the reign of the great Emperor Frederic II. For these labors, and many more of the same kind (the one we have just mentioned engrossed seventeen years of the compiler's life), historical science is indebted to the learning and industry of M. J. L. A. Huillard-Bréholles, of whom Mr. Oliphant gives a short memoir. Huillard-Bréholles was a genuine scholar, and his life was uneventful ; he was, in historical research, the right-hand man of the Duc de Luynes. They worked together with great mutual esteem, and rendered each other indispensable assistance. Bréholles was happy in his intelligent patron, and the Duke was worthy of his indefatigable investigator. Bréholles seems to have been a modern reproduction of those heroic editors, the seventeenth-century Benedictines. He was, says Mr. Oliphant, "in certain branches of learning simply without a rival." He did an enormous quantity of work, but he belonged to that class of workers whose labors are, so to speak, subterranean, and of whom the general public never hears. They excavate, they move into place the great blocks and beams upon which the men who become famous rear their shapely superstructures. The more reason that justice should occasionally be done them, competently and sympathetically, as Mr. Oliphant has done it here. The author has affixed to these two biographical notices a condensed translation of the autobiography of a certain Fra Salimbene, a Parmesan friar of the thirteenth century, who appears to have been a great traveller and to have enjoyed a near view of many of the important events of his time. The narrative is excellently translated, without overdoing the quaintness, and, with the writer's naïveté, his shrewdness, his intense mediæval savor, is in the highest degree entertaining. We regret that want of space forbids us to quote from it ; it has some delightful passages of unstudied picturesqueness. Lastly, Mr. Oliphant's volume contains a short examination of the question whether the English aristocracy was largely destroyed by the Wars of the Roses, which is answered very definitely in the negative ; and some remarks on that characteristically British fact—the compatibility, as married people would say, which has generally existed between the English Lords and Commons. This has been very satisfactory in the past, but Mr. Oliphant assumes perhaps a trifle inconsiderately that its shadow will never grow less in the future.

---

*On Actors and the Art of Acting.* By George Henry Lewes. (London: Smith, Elder & Co. 1875. Pp. xii.–278.)—Years ago Mr. Lewes contributed to the *Foreign Quarterly Review* a series of admirable essays on the Spanish

drama, afterwards collected into a little volume not yet out of print. Later, under the pen-name of "Slingsby Lawrence," he adapted to the English stage 'La joie fait peur' of Mme. de Girardin and the 'Mercadet le faiseur' of Balzac. He has never lost the love for the theatre shown plainly in his 'Life of Goethe,' as well as in these earlier essays; and now, his "slumbering interest in the stage" having been reawakened by the recent successful performances of Signor Salvini in London, and seeing "signs of a revival of the once splendid art of the actor," he has been "made sensible of the chaotic state of opinion on the subject of acting in many minds of rare intelligence." Therefore, to correct this, and to "direct attention not simply to the fact that acting is an art, but that, like all other arts, it is obstructed by a mass of unsystematized opinion, calling itself criticism," he puts forth the volume before us. The means seem inadequate to the end; for Mr. Lewes's book is not a symmetrical and logical treatise; it is a thing of shreds and patches, a hasty compilation of hastily-amended articles gathered from the magazines and reviews of the past twenty-five years. These essays, "written during a period of dramatic degradation," when it was hard even for Mr. Lewes, with all his enthusiasm for the stage, to be hopeful, were in their proper place in the pages of a periodical. Now that the stage in England has improved almost to a point when the poetic drama seems again a possibility, the accumulated hopelessness of these collected articles seems especially ill-timed. But aside from this, a volume so invertebrate is not what we expect from a writer of Mr. Lewes's reputation. It is a pity that a scholar as thorough and a critic as acute as he is should not have written the useful essay upon the art of acting which he is quite capable of writing. We have no mate in English to Samson's rhymed critical essay in the style of Boileau or Pope, 'L'Art théâtral,' unfortunately too little known to American actors, audiences, and critics. An interesting treatise on acting more elaborate and detailed than Hamlet's advice to the players, still the best essay on acting, could indeed be compiled from either Colly Cibber's 'Apology' or from this volume of Mr. Lewes, which, in spite of its unsystematic and conglomerate character, contains here and there much that is valuable. The fifteen articles brought together in it include criticisms of the Keans, father and son, Rachel, Macready, Farren, the younger Matthews, Lemaître, the Keeleys, Salvini, and of various foreign actors on the English stage; essays on Natural Acting and on Shakspere as Actor and Critic; and accounts of the drama in Paris (1865), in Germany (1867), and in Spain (1867).

The criticisms of actors are excellent, marred only by the repetition which comes of writing at different times on kindred subjects. Of Edmund Kean the criticism is especially fine, lit up by many nice discriminations:

"The greatest artist is he who is greatest in the highest reaches of his art, even although he may lack the qualities necessary for the adequate execution of some minor details. It is not by his faults but by his excellences that we measure a great man. The strength of a beam is measured by its weakest part, of a man by his strongest. Thus estimated, Edmund Kean was incomparably the greatest actor I have seen, although even warm admirers must admit that he had many and serious defects" (p. 1). . . . "Kean was not only remarkable for the intensity of passionate expression, but for a peculiarity I have never seen so thoroughly realized by another, although it is one which belongs to the truth of passion—namely, the expression of *subsiding emotion*. Although fond, far too fond, of abrupt transitions—passing from vehemence to familiarity, and mingling strong lights and shadows with Caravaggio force of unreality—nevertheless, his instinct taught him what few actors are taught—that an emotion, after discharging itself in one massive current, continues for a time expressing itself in feebler currents. The waves are not stilled when the storm has passed away. There remains the ground-swell troubling the deeps. In watching Kean's quivering muscles and altered tones you felt the subsidence of passion. The voice might be calm, but there was a tremor in it; the face might be quiet, but there were vanishing traces of the recent agitation" (p. 9).

Of Rachel Mr. Lewes says that her expression was perfect within her limited range; late in her career "she grew careless; played her parts as if only in a hurry to get through them, flashing out now and then with tremendous power, just to show what she could do; and resembling Kean in the sacrifice of the character to a few points" (p. 24). "Rachel was the panther of the stage; with a panther's terrible beauty and undulating grace she moved and stood, glared and sprang. There always seemed something not human about her. She seemed made of different clay from her fellows—beautiful, but not lovable. Those who never saw Edmund Kean may form a very good conception of him if they have seen Rachel. She was very much as a woman what he was as a man. If he was a lion, she was a panther" (p. 23). In Macready Mr. Lewes saw a man of talent (but of talent so marked and individual that it approached very near to genius) who achieved greatness by incessant study. The remark (p. vii.) that "people generally overrate an actor's genius and underrate his trained skill" applies with particular force to Macready, who, according to Mr. Lewes, "would have made an excellent clergyman or member of Parliament; but there is absolutely no evidence that he could have made such a figure either in the church or senate as would compare with that which he made upon the stage" (p. 50). In Frédéric Lemaître, even in his best days, Mr. Lewes detected something offensive to good taste—"a note of vulgarity, partly owing to his daring animal spirits, but mainly owing, I suspect, to an innate vulgarity of nature." This occasional bad taste, which found its apotheosis in a colossal caricature, Robert Macaire, would never be suspected by a reader who judged the actor solely from the dithyrambic rhapsodies of Hugo and Gautier. It is to be regretted that Mr. Lewes has omitted any mention of Mme. Dorval, who shared with Frédéric in many of the triumphs of the palmy days of the romantic drama, bearing bravely in Hugo's "Angelo" a supreme test of dramatic excellence—*i. e.*, playing at the Comédie Française side by side with Mlle. Mars.

The chapters on Natural Acting and on Shakspere as Actor and Critic are the best in the book, producing indeed an effect of rounded finish which is lacking in many of the others. The reader of the 'Life of Goethe' who remembers the author's love for Hamlet will meet in this volume with further illustration of his delicate and discriminative insight into Shakspere's art. In short, although this book lacks the homogeneousness to be justly expected from the author of 'Problems of Life and Mind,' yet it is valuable, first, as the record of the impressions produced upon a mind of singular sensibility by many actors of renown, and lastly, indeed chiefly, because it formulates and reiterates sound opinions upon the little understood principles of the art of acting.

---

*Deutsche Geschichte von* 1815–1870. Von Luise Büchner. Zwanzig Vorträge gehalten im Alice-Lyceum zu Darmstadt. (Leipzig: Theodor Thomas; New York: Westermann).—Germany, the land of advanced ideas, is looked upon with disfavor by many of our *émancipées* because of the aversion it has shown to treating the education of women as a fit subject for radical innovations. In no other leading country is woman debarred so rigorously from sharing in the benefits of the best methods and apparatus of training. This may appear unjust, yet it has at least the merit of consistency. Opinion in Germany having been pronounced in favor of woman's "subordination," it follows, by logical deduction, that she should be excluded from those institutions whose especial mission it is to qualify their pupils for filling the controlling positions in society. Whether this state of opinion will be permanent, or is destined to speedy modification, are questions which do not concern us here. This much at least is certain: although Germany withholds from its girls and women the very highest education, the education that it does give them is very good and very thorough. In fact, a perfectly impartial comparison might show us that our own system, notwithstanding its seeming liberality and the specious generosity with which it throws open the doors of the professions, is after all less robust, less productive of good results than the German. Of this Miss Büchner's recent work is an evidence. Not that we praise it unqualifiedly as a model text-book. The professional fault-finder could pick more than one ugly flaw in it, and even the sober critic must admit that it leaves much to be desired. Yet, with all its defects, it is what it purports to be, the earnest, well-sustained effort by one not a professed historian to sketch in a moderate-sized volume the strange story of the foundation of modern German nationality, and to make it at least intelligible to the reader possessed of ordinary information. The time has not yet come—and the authoress would be the first to admit it—for a thoroughly scientific history of the German uprising. The waves of passion still run too high, the chafings of the French and Austrian yoke are too recent, to permit of calm judgment. We must await the Ranke or Von Sybel of the second, possibly the third, generation. Yet it is important that the young growing minds of the present generation should have a clear and connected account of the principal events in that epoch of German history which begins with the Prussian uprising against Napoleon in 1813, and ends with the establishment of the new German Empire.

This account Miss Büchner has undertaken to furnish. A careful examination of the work has inspired us with sincere respect for the writer and also for the young ladies in whose behalf it was written. Truly, the pupils of the Princess-Alice Lyceum of Darmstadt must be of a different order of mind and disposition from the *habituées* of Madison Avenue and Gramercy Park, to be fed thus with six hundred pages of substantial history, unrelieved with fiction, undiluted with watery moral axioms. Although written by a woman for women, it may be characterized as a

"manly" work, in that it goes straight to the point, and compresses a great deal of valuable information within narrow limits, without trying to make it directly palatable to the so-called female mind. We have not the space for even an abridged statement of its contents, but must be satisfied with the general announcement that the reader will find every prominent event since 1815 discussed, or at least mentioned, in its bearings upon the drift of European affairs.

Miss Büchner's views are not always sound; for instance, her strictures upon Metternich are not justified by the authority that she has followed. Sprenger (in his 'Austria,' I. 137) says expressly that the charge of bribery can *not* be proved against Metternich. A more serious defect is the writer's disposition to represent the so-called Restoration period as one of universal gloom and depression. Quite to the contrary, Europe has seldom enjoyed a period of greater prosperity in letters, the arts, science, and commerce than from 1815 to 1840. Despite Laibach, Verona, the Spielberg, Metternich, and Nicholas, Europe was progressing rapidly in every department; the germs of human rights sown by the French Revolution were bearing rich fruit. We doubt if the present of Europe, with its colossal armaments, its sharply drawn lines in nationality and church, wears so attractive, so humane a mien. We object also to the writer's animosity towards the French. So long as German unity hung in suspense, mistrust and bitterness were perhaps not out of place; but at present, after unity and even supremacy have been achieved, we feel called upon to remind the Germans that it becomes the victor to be temperate.

The book has, furthermore, one or two defects of execution. The misprints are numerous and some of them are serious, and there is no alphabetical index of places, persons, and subjects. It seems as if the Germans, so prolific of helps to knowledge, would never learn the usefulness of indexes. The works of some of their best scholars, such as Ranke, Droysen, Springer, etc., lose half their value for want of such aids to reference. In a work for the use of young scholars the omission is inexcusable.

---

*Personal Reminiscences.* By O'Keeffe, Kelly, and Taylor. Edited by Richard Henry Stoddard. Bric-à-Brac Series. (New York: Scribner, Armstrong & Co. 1875.)—The present volume of this series contains what Mr. Stoddard calls the "anecdotal substance" of three old books—O'Keeffe's Reminiscences, which appeared in 1826; Kelly's, which appeared in 1825; and Taylor's, which appeared in 1832. They were all English books, however, and probably not very well known out of England, except to thoroughly read persons of æsthetic tastes. And, indeed, if we may infer anything from the case of M. Taine, one of these books, which seems to have escaped that writer's notice altogether, might be profitably studied even now by those who desire to make themselves and their fellow-creatures thoroughly acquainted with the history of English literature and the English stage. Taine's object in his 'English Literature' is, to be sure, rather critical than historical; still it is strange that in writing his brilliant account of Sheridan's career he should have taken the popular tradition as to the circumstances of his death, without consulting such an authority as Michael Kelly, who was intimate with Sheridan, and fifty years ago had published a flat contradiction of the popular stories on the subject. Taine gives this picture of the close of Sheridan's life:

"At last a bailiff arrested the dying man in his bed, and was for taking him off in his blankets; nor would he let him go until threatened with a lawsuit, the doctor having declared that the sick man would die on the road. A certain newspaper (the *Examiner*) cried shame on the great lords who suffered such a man to end so miserably; they hastened to leave their cards at his door. In the funeral procession two brothers of the king, dukes, earls, bishops, the first men in England, carried or followed the body—a singular contrast, picturing in abstract all his talent and all his life, lords at his funeral and bailiffs at his death-bed."

This contrast, however, is not more striking than that between the account given by M. Taine and that given by Mr. Kelly. The latter says that "the reports industriously circulated" that Sheridan, in his latter moments, "was left in want of the common necessaries of life" were "groundless, and fabricated for the most atrocious purposes of scandal"; that two hundred pounds were sent him by an "illustrious donor," but were actually returned by Sheridan (those who are fond of contrasts may find one of the strangest on record in this simple act), because he was in want of no assistance; and finally, that he, Kelly, sent, a few days before Sheridan died, for "his own man," who was in attendance, and faithfully attached to his master, and that he was assured by this man, in reply to an entreaty for the truth about the stories then in circulation, that he need give himself no further anxiety, for Sheridan was in want of nothing, and that the stories were libels. It should be observed, too, that this is, antecedently, far the more probable version, for Sheridan was the last man in the world to have been forgotten in extremity by his friends.

This is a small matter, but it shows how little books like those here extracted from become generally known that the popular tradition should, in the face of such explicit denials, have still a vitality vigorous enough to obtain for it a foothold in a philosophical history of English literature. The story about the death-bed *capias* is true, as we learn from the extracts from the reminiscences of John Taylor, but *capiases* were an everyday affair in Sheridan's life, and they had long ceased to have any terrors for him. It is the deserted death-bed of the brilliant author and man of pleasure that Taine wishes to introduce us to, but the desertion, which is the main point, was made out of whole cloth.

In looking over not only the reminiscences of Michael Kelly, but those of O'Keeffe and Taylor as well, the reader cannot fail to be struck with the impression that most of the contents, if not always very instructive or even amusing, does at least seem new. The volume contains reminiscences, we may almost say, of everybody who flourished in the latter part of the last century or the early part of this, from Garrick down to "Monsieur Tonson" and the original of "Jeremy Diddler" in the farce of "Raising the Wind," who was no other, the reader may be glad to know, than a decayed gentleman named Bibb, commonly known to his contemporaries as "Half-crown Bibb," and reputed to have borrowed two thousand pounds in half-crowns.

---

*Man and Beast Here and Hereafter.* By the Rev. J. G. Wood. (New York: Geo. Routledge & Sons.)—Concerning the hereafter of beasts as of men, Mr. Wood knows as much as the rest of us and no more. His aim is, in this respect, to show by an examination of Scriptural texts that a future life is not denied the brute creation in the Bible, or, if it is, it is also denied to man. "We have no right to pick and choose which passages we are to take literally, and which symbolically, but must apply the same test to all alike, and treat all in the same manner." He then illustrates, by means of a great number of original anecdotes, the possession by the lower animals of reason, language, memory, a sense of humor, and a capacity for tyranny, generosity, duplicity, jealousy, pride, sympathy, conscience, love of master and of offspring, etc. And finally, he cites a number of distinguished men and women who have believed that for brutes as for man there is beyond this existence another opportunity of life, development, and compensation; and argues that if this be not so, it is difficult to see what becomes of divine justice. The negative arguments in favor of this view—or of the view that the spirit in man and in beast has a similar destiny, whatever that may be—will certainly always outweigh the negative arguments against it, like that of the objector who wrote Mr. Wood that "he would never condescend to share immortality with a cheese-mite." They will continue to gain in force the more the lower animals are studied with a view to their intellectual or spiritual likeness to man. This likeness Mr. Wood sets forth in a popular way, with cumulative evidence of a sort to which there is no end. Those who have read him should go for a scientific and exhaustive discussion of the subject to the chapters on the "Comparison of the Mental Powers of Man and the Lower Animals" in Darwin's 'Descent of Man.' The question whether the difference is one of degree or of kind turns upon the origin of the moral sentiments in man, and this too Mr. Darwin discusses. According as it is answered will be our belief in "that equal sky" of Pope's "poor Indian."

# The Nation.

*NEW YORK, THURSDAY, OCTOBER 7, 1875.*

## The Week.

THE President made a speech at a late reunion of the Army of the Tennessee which took the country a good deal by surprise, both because of his dislike of speech-making and of his somewhat singular choice of a subject. His discourse was very brief, and after the usual compliments to the soldiers and the now usual friendly and conciliatory allusions to the South, he announced that when the next contest occurred the dividing line would not be Mason and Dixon's, but between "patriotism and intelligence on the one side, and superstition, ambition, and ignorance on the other," and this he followed by a denunciation of sectarian schools and a commendation of "a common-school education unmixed with pagan, sectarian, or atheistic dogmas." He also advised that religious education be left "to the family altar, the church, and the private school," and that the church and state be "kept for ever separate." It is difficult to understand from this whether the President really fears that the patriotic and intelligent people are going to have a physical fight with the superstitious, the ambitious, and the ignorant; but if so, it is as well to say that that fight has been going on for a long time, and is being waged at this moment with varying fortune in all parts of the civilized world, and that on the whole "the superstitious, and ignorant, and ambitious" get the worst of it, and are now undergoing imprisonment in great numbers and performing forced labor at the hands of the cruel victors. From all we hear and see, there is no immediate prospect of a cessation of hostilities, though they have raged ever since Cain killed Abel. General Grant's interest in the school question is apparently greater than most people supposed, and his advice, if not needed, will undoubtedly be well received.

The Republican Convention at Worcester which took place on Wednesday of last week was, as will be seen from the description which we publish elsewhere, a thoroughly harmonious and satisfactory meeting. The resolutions are in great measure satirical and denunciatory of the Democrats; congratulate the Republicans of Massachusetts that nothing in *their* record makes it necessary for them to give pledges of any kind as to the settlement of the war, slavery, and debt questions; promise to support none but fit men for office, and "invoke the condemnation of the ballot-box" upon any unfit man of whatever party; declare the Republicans in favor of civil-service reform at whatever cost; also, that while not recognizing "privilege of class," nor any "antagonism between labor and capital," but deprecating any attempt to "fetter" either, they will try to "develop the resources" of both, "stimulating one and diffusing the other into channels of common prosperity," and will support "all measures that regard the promotion of temperance, education, good morals, and the equal rights of all American citizens irrespective of sex," the maintenance of order, economy in government, and reduced taxation. The party further congratulates itself on the reduction of national expenditures; thanks General Grant for his "independence, courage, and good sense"; hails with "exceeding joy" the evidences on all sides of a renewal of a fraternal spirit North and South; declares against a third term, and, in emphatic language, denounces an irredeemable currency and insists on the speediest possible return to specie payments. The nominee for Governor, Mr. A. H. Rice, is a respectable man, and as between him and Mr. Gaston there is not much to choose. The most remarkable thing in the proceedings was the steady voting for Mr. Adams, the only one of the three leading candidates who had not a body of workers and wire-pullers behind him. It begins to look as if the support of Mr. Adams was really, after all, among "the masses." We understand that Mr. Henry Wilson broke down towards the end of the day, and showed such signs of physical exhaustion that as a Presidential candidate he is looked upon by the party leaders as out of the question.

Mr. C. F. Adams, jr., has been delivering a lecture on the railroad question to the Grangers of Oshkosh which must have somewhat startled his hearers. Mr. Adams is, as he says, the senior railroad commissioner of the country, and it may be said for, if not by, him that he is almost the only railroad commissioner in the country of any weight or authority, and therefore what he says is important. He now tells the Grangers of the West what we have always maintained in these columns, that the only amelioration that can be brought about in the railway system of the country will be not through penal legislation but through publicity, public accounts, public enquiry into grievances, and public applications for redress. Mr. Adams shows some indications of a lingering belief that in the very distant future the consolidation of the railroads will end in their being absorbed by the Government; but his future of Government railroads is so remote that he does not himself think it worth while to provide for its approach, while he admits explicitly that all his own former dreams of managing the railroads with a strong hand have been dissipated by experience, and that in Massachusetts the establishment of a commission with merely advisory powers has proved so effectual in the remedy of abuses and the introduction of reforms that his own regret at not having more power has disappeared. The amenability to an enlightened official opinion shown by the Eastern railroads in the introduction of such reforms as the cheap workmen's trains running into Boston, show that the monopolists are not quite such tyrants and foes of liberty as they have been represented. Besides the arguments brought forward by Mr. Adams, we may mention, as conclusive against any tendency to absorption of the railway system by the Government, the large number of Constitutional Amendments adopted within the past half-dozen years totally forbidding States, counties, and towns to engage in railroad construction, railroad management, or even railroad loans.

The Fall River troubles have come to an end, most of the mills having already obtained hands enough willing to sign an agreement supposed to be sufficient to guard against trade-union difficulties. The uprising in New York which was to have been headed by Mr. John Swinton and other promising Communists did not come off, owing to the refusal of the Park Commissioners to let them have Tompkins Square for the object in question. This refusal will of course be regarded as an act of gross tyranny by Mr. Swinton and his friends, but really amounts to no more than the advice nowadays given so frequently to public men who bore the public, to "hire a hall." This Mr. Swinton and his fellow-reformers will no doubt be able to do provided they can obtain the funds, and these they may very likely be able to procure from Mr. John Morrissey and the anti-Tammany reformers, who have declared it to be their purpose to have "no more one-man power" but to "let the people rule." Whether the Fall River operatives will be kept out of the reach of the trade-unions by a simple agreement is very questionable, but the agreement will have the good effect of bringing the relation of the capitalists on one side and the laborer on the other with the unions under the cognizance of the courts. Many if not most of the scandals and outrages which have arisen in connection with the unions have come from their extra-legal character, and the disposition which has been shown to treat their really enormous moral power as non-existent. The only way they can be dealt with is to admit their power over the workingman, and make them responsible for the proper exercise of it.

It is not surprising, for various reasons which we need not enumerate, that Mr. Theodore Tilton should make his appearance once more before the public as a moral philosopher, and offer instruction on the conduct of life, for a very small fee. What surprises us is that newspapers which have not only recently exhausted the ordinary English of the day, but have tried to invent words, in order to describe his folly and his baseness, should be now both reporting his sermons and criticising him and them in highly commendatory language, in fact, presenting him to the public as a teacher well worth listening to. Things of this sort naturally lead plain people to ask whether newspaper moralizing is anything more than the patter of a street vender of small wares, or whether any editor's judgment of either men or things rests on anything better than the market demand of the moment for a certain kind of article, and whether newspaper offices do really contain a standard of right and wrong. If Tilton was last spring what the papers said he was, his advent as a preacher on "The Problem of Life" is a piece of fatuous impudence; if he was not, their attacks on him were shameless and atrocious libels. There is one other point on which a good deal might be said, and that is the readiness on the part of a portion of the public, revealed by the large audiences which even men in his position can draw, to treat all connection between character and oratory as of little or no consequence, and to pardon everything to anybody who can manage to be "brilliant" or "entertaining." This weakness has created and keeps afloat a crowd of rhetorical charlatans, who discourse by the hour on morality, religion, finance, and what not, without the smallest pretence to any particular knowledge of any of them, or without any admission of any responsibility for anything except the amusement of the crowd for the allotted hour. The result is the gradual approximation of oratory to music, and the reduction of articulate propositions to the ethical level of do, re, mi, fa, sol, la, si.

---

The Bank of California successfully resumed payments on Saturday. A large amount of coin had been accumulated—sufficient to meet all possible demands, and, besides, it was known that there was a guaranty fund of $7,000,000. Such was the confidence in the permanency of the resumption that deposits were made on the first day to the amount of $700,000 in excess of what was drawn out. The bank stopped payment August 26, and its suspension was followed by that of other institutions, of which the chief were the National Gold Bank and the Merchants' Bank. All these have since resumed business, and the San Francisco Stock Exchanges or Mining Boards have since been opened. In fact, San Francisco may be said to be on its feet again, and to have exemplified the truth that, while there may be speculative expansion, collapse, and panic when specie is the currency, the recovery is quick and certain. The mining capitalists who made war on the Bank of California opened their bank on Monday. It is called the Nevada Bank, and has a cash capital of $5,000,000 in gold, with a right to increase to $20,000,000. The bank was organized several months before the panic under the general laws of California. The owners of the Nevada Bank and their followers form probably the wealthiest "clique" on the continent, it being estimated that they have property to the amount of nearly $100,000,000.

---

While San Francisco has during the week bounded into the position it was in before the breakdown of the Bank of California, the paper-currency States have been making slow and uncertain recovery from a panic which occurred more than two years ago. Wall Street is in the condition of a patient recovering from a low fever. Confidence returns slowly, and the speculators, who are as willing to depress as to advance securities, still find it easier to work on the fears of the people and induce them to sell stocks than to encourage them to buy on the faith of a general improvement in the trade of the country. That trade has improved and is still improving is indisputable, but there are enough failures to keep the public constantly expecting some astounding disaster. The price of gold has been as high as 117⅛, the rise reflecting only the small supply. The banks now report but about $6,500,000, an amount insufficient, if it were easily obtainable, for the easy working of the foreign-exchange market. This amount is under control, and can only be borrowed at high rates—from 1½ to 2½ per cent. per month. Mr. Bristow undoubtedly appreciates by this time the error of buying up silver to take the place of fractional currency (not redeemable or exchangeable for silver) and of redeeming five-twenty bonds on a forced construction of the law respecting the Sinking Fund, by which gold has been driven out of the country, until there is so little left that it is a question whether some other means will not have to be temporarily adopted in the settlement of exchange operations between bankers and the importers on one side and the exporters on the other. Gold must else be imported in considerable amount. Every steamer brings some, but not enough has yet arrived to give relief. Grain and cotton are beginning to move to the Atlantic ports, and it is important that there should be no obstacles to a free outlet. The money market has changed but little, call loans being nominal. The indications are of firmer rates in the early future. At noon on Saturday the value of $100 currency was $85 47.

---

England is in the middle of the dull season, and the public attention is still concentrated on the swimming of the Channel by Captain Webb and the loss of the *Vanguard* iron-clad. Testimonials, both substantial and unsubstantial, continue to flow in on Capt. Webb, who is honored, not undeservedly, as having furnished unmistakable proof that man is fully holding his own, if not gaining, as an animal. The doctors cannot tell how it was that he did not become chilled by his long stay in the water, and he can throw no light on the subject himself. He says, however, that he thinks being smeared all over with porpoise fat did him no good, but acknowledges that this point could only be settled by an attempt to swim across without the fat. The doctors testify to the great width and capacity of his chest, but throw some discredit on the received maxims of the art of training by declaring that his muscular apparatus is not particularly prominent and is tolerably well covered with adipose matter. In short, he is not to outward appearance in what a trainer calls "condition," but looks like an ordinary but well-developed citizen of modern height, who eats what he pleases and takes only moderate exercise. His feat is naturally producing crowds of imitators, most of whom have to be taken into a boat in an hour or two in an exhausted condition, while one or two have sunk before rescue.

---

The sinking of the *Vanguard*, an iron-clad of the first class, after receiving a tap from the ram of the *Iron Duke*, a ship of the same class, in a fog, is by no means as pleasant a subject of contemplation as Webb's feat. In the first place, the captain has been dismissed from his command by court-martial for changing his course and lowering his speed without properly signalling the rest of the fleet; but then the signalling arrangements seem defective, and there is a strong opinion that the Admiral is to blame for the high rate of speed at which the fleet was going in a dense fog. These are, however, small matters. What has produced most sensation is the light which the affair throws on the conditions of naval warfare. Here is a ship, it is said, of size and power so great that one officer, writing to the *Times*, calls her the equivalent of an army corps—say of 30,000 men, and yet she is sent to the bottom in thirty minutes by a single blow. He asks, therefore, who would consent to command an army, if a whole corps could be swept out of existence at any moment by a chance shot of the enemy? And yet it is under conditions somewhat similar that an admiral will now go into action, for it appears that the projecting ram or spur of the present man-of-war will strike an iron-clad where she is just as vulnerable as an old wooden liner. The hole made in this case was fifteen feet long by four broad, and it was incurable, in spite of water-tight compartments. It looks as if quick and agile manœuvring would hereafter be of even more importance at sea than the thickness of the iron plates or weight of the guns.

In France, the usual source of excitement and comment at this season—the session of the Permanent Committee of the Assembly which watches over the Republic during the recess—is wanting, as perfect peace reigns in that body. The newspapers occupy themselves with the speeches at the dinners of the agricultural societies which occur at this season in various parts of the country. It depends on the prefect, however, whether political topics shall be touched on or not, and the prefects for the most part prohibit it, so that there have been a series of rows between these functionaries and orators who wished to talk politics. The most notable topic of discussion of late has been a rumor that the Orleans princes had given in their adhesion to the Republic, or, in other words, had abandoned the "fusion" with the Count de Chambord and had made up their minds to be plain citizens. Their organ, the *Journal de Paris*, neither confirms nor denies the rumor, but says that its friends are men who know how to reconcile themselves to accomplished facts and to wait with patience for whatever the future may bring forth. A workingmen's conference in Paris in favor of the settlement of international differences by peaceful arbitration has, as far as the French are concerned, been a failure, few being willing to declare openly that they would sooner give up all hope of recovering Alsace and Lorraine than fight for them; but this does not prevent Emile de Girardin, who was one of the maddest advocates of war in 1870, from publishing a series of letters recommending France to disarm and give up all pretence to being a first-class military power, and devote herself to commerce and industry. It is a curious sign of the times that these letters are favorably received, and that there is a total lack of interest in military questions, and a strong disposition on all sides to acquiesce in the retirement of the country from the military arena. At the same time, its material progress is something wonderful. Kelley, the Pennsylvania Sage, will be surprised to hear that although there is a steady contraction of the blessed paper-money, and although there is not a 3.65 bond in the whole country, and nothing is done by anybody "to keep the volume of the currency up to the demands of business," business grows apace. The taxes during the past year have outrun the estimates by $12,000,000. The exports have increased over $33,000,000 during the first eight months of this year. The foreign trade of the country, which amounted to $1,120,000,000 in 1870, amounted last year to $1,520,000,000, and yet the people have no means of drawing out money from the Treasury when they want it. Why does not Kelley carry his 3.65 plan to France, and take Mr. Wendell Phillips and Gratz Brown with him to explain it?

---

The text of the circular sent by the Papal Nuncio in Spain to the bishops has come out by the last mails, and it would be useful, if the matter needed any further elucidation, in illustrating what Catholic prelates mean when they talk about "religious liberty" and "equal rights." The Nuncio claimed peremptorily the execution of the Concordat of 1851. By the new constitution, freedom of religious opinion and religious worship is allowed, but the Catholic religion retains its place as the religion of the state, and all public ceremonies or manifestations on the part of other denominations are forbidden. The Nuncio is not content with this, and claims the execution of the first clause of the Concordat, which forbids the open profession of any other creed; also of the second clause, which provides that "*all* instruction in public and private schools shall be in conformity with the Catholic faith, and the bishops shall be charged with watching over the purity of faith and morals in the schools"; also of the third clause, which provides that the bishops "shall have the help of the secular power every time they shall have either to oppose the malignity of men who try to pervert the souls and corrupt the morals of the faithful, or to stop the printing, introduction, or circulation of bad and perverted books." This, it will be perceived, gives the bishop the use of the police in exercising a censorship over all literature, and enables him to prescribe the mode in which every child shall be taught; for it makes him supreme in private as in public schools. Yet if this Nuncio were transferred to the United States, and were to engage in the school controversy here, he would put on a bland, liberal, and "broad" look, pretend he never had heard of the Spanish Concordat or the Inquisition, treat the stories of Papal intolerance in European countries as mere inventions of infidel and Protestant writers, and declare that what the Church sought was only fair play and "equal rights"; that what she sought here was not the right of interfering with the education of the Protestant children—God forbid—but simply and solely the right of using the Catholic share of the school-tax in her own way. The circular closed with something very like a threat that if the Concordat was set aside, the Church might have to throw in her lot with Don Carlos—that is, give him her blessing, and begin cursing Don Alfonso.

---

The Pope has been delivering an address to some French pilgrims who paid their respects to him at Rome, in which he gave an account of the state of Christendom which must fill every right-minded man with the deepest pain. He says "the modern Pharisees," not content with despoiling the Church and persecuting her ministers, are "establishing a monopoly of evil teaching." There is also, he says, "a perfidious league" which is trying to prevent the ordination of the clergy, and is giving protection to apostates, with a view not only to using them as stumbling-blocks, "but as means of corruption." The same horrid state of things prevails in all parts of the globe. Russia is acting in an outrageous manner towards the Church, so is Switzerland, and in South America there are most atrocious attacks on bishops, priests, and nuns, though there is there one good Republic where she gets her due, but then "the impious" even here "darkly congregated together" and murdered the President. In fact, whichever way the Pope turns his eyes he sees sectarian schismatics, Freemasons, and other bad characters vieing with each other in rascality. The only consolation he has in all this is that the number of saints is all the while increasing through these very enormities, and he advised the pilgrims to be patient and hopeful, and imitate Daniel O'Connell, and all would come right in the end.

---

The news from Herzegovina is merely a kind of clearing up of the earlier reports. It is now acknowledged on all hands that the insurgents never achieved any success whatever; that whenever they stood to fight they were slaughtered or dispersed easily by the Turkish troops; and that, as we said last week, the great difficulty of the Commission composed of foreign consuls which started out to mediate was to find anybody to negotiate with. Of course there has been a great deal of plundering and burning, and crowds of fugitives have crossed the border into Dalmatia and Servia, but there has been no war. The rising, such as it is, has been fully as much directed against the Mohammedan landlords as against the tax-gatherers. The exactions of the former are constant as well as searching and oppressive, while those of the latter are only occasional. Servia's talk of interference can hardly have been more than talk. Her regular army only musters 4,000 men, and her militia, which is a mere levy *en masse*, without drill or discipline or officers or commissariat, is only 50,000 men on paper. It has to be remembered that in old risings against the Turks in Eastern Europe the insurgents and the troops were about equally well armed and equipped. But all the recent improvements both in small-arms and artillery have helped to raise even the poorest regular force far above any hasty gathering of civilians, and the collision of a body of peasantry, armed with smooth-bores and yataghans, with Turkish regulars with breech-loaders, is and can only be a massacre, if the peasantry are really brave. The affair will probably end, however, in some attempts at reform; and already the news comes from Constantinople that the Christians are to be more fairly represented in the local councils, and that they are even to be invited to send up notables to some sort of assembly at Constantinople which is to represent them before the supreme government. But the difficulty which lies behind all these changes of machinery is the indomitable scorn and sense of superiority of the Turks and the cowed submissiveness of the Christians.

## POLITICAL "CAPITAL."

A GOOD deal of the current Republican comment on Governor Tilden's dealings with the Canal Ring must recall to many people President Lincoln's mode of dealing with the charge of drunkenness against General Grant in the earlier and better days when the latter was winning victories in the West—"that if he only knew what brand of whiskey it was that Grant used, he would send a barrel of it to every general in the army." Republican newspapers have told us frequently that Mr. Tilden is doing what he is doing, not through sincere hatred of corruption, or through any particular love of reform, but merely for effect, or, as the phrase is, "to make capital," and that his real design in assaulting the "Canal thieves" is to help himself in his race for the Presidency. Now, "making capital" is by no means in itself an illegitimate process. All peaceable men pursuing an honest calling are "making capital"—that is, producing a favorable impression on observers as to their character and aims. It is only when a man is pretending to do something, or to be meaning to do something, which he is really not doing or does not mean to do, that "making capital" becomes at all objectionable or disreputable. When a politician, for instance, shams emotions he does not feel in his speeches, or repeats in public cries which in private he laughs at, or makes promises which he has no intention of performing, he is "making capital" fraudulently, and deserves corresponding treatment. And the reason why "making capital" has in political parlance acquired an odious sense is that the last-named mode is unhappily so much more common than any other. In fact, to say now that a man is doing a thing in order "to make capital" out of it is the equivalent of saying that he is trying to secure the good opinion of his countrymen by some species of fraud or humbug; and the phrase has even received an extended significance, in which it is applied to Mr. Tilden's case, which makes *all* methods of securing popularity in which there is any sign of personal ends, *per se* mischievous or discreditable.

Its application to him in a bad sense, however, on the part of his political opponents, under present circumstances, shows a very marked misconception of the state of mind of that large body of voters who, though much interested in politics, are not at all interested in the distribution of offices, which, to the politician proper, lends the game all its excitement. It is difficult for an experienced politician to believe it, but it is nevertheless true, that people are in a very puzzled and despondent state of mind about the political situation, and have got beyond the point at which they look for the appearance of the ideal statesman, uniting the purest motives with the highest ability. They can get the pure motives, and they can get the high ability; but somehow, owing to no matter what circumstances, to get a man who unites both into a leading place in the Government is a work of such difficulty that most people have given it up as (for the present, at least) a bad job, and are willing to content themselves with any man who, for whatever motive, will do good work. It so happens, too, that the work to be done at this moment is not work which calls either for the highest order of genius or the highest aspirations. A man may do it very well without being a Moses or a Washington—without, in short, being either a prophet or a hero. He has neither to lead a race out of captivity nor call a nation into existence. The task before the American politician of to-day is the simple and somewhat homely one of preventing public officers from stealing and dividing the public money, and of preventing the Government from cheating its creditors; and when a man offers himself for this work, there is no general disposition to ask whether he is a statesman of the first rank, or whether his political judgment has always been sure, or his voice been always heard on the right side. Republicans have been making a serious mistake on this point. They have flattered themselves that as long as the Democratic party produced no saints or martyrs, their own supremacy could not be endangered. But they have forgotten that, while they were relying on this hypothesis for a continuance of their power, politics was rapidly becoming a department of criminal jurisprudence, and the public was perforce turning its attention from the question of how best to promote its happiness to the far lower one of how best to secure its property from spoliation. Now, when you call a policeman in to secure a burglar, you do not question him as to the state of his heart or his views on the basis of morals; you ask him whether he is able and willing to catch the thief; and, having satisfied yourself on this point, you refuse to be disturbed by the information that he is now an infidel or was formerly a gambler, especially when the objection emanates from an irreproachable and philanthropic gentleman who has locked himself in a room on the top story of the house, and offers to succor you by reading a pamphlet to the thief showing the injury inflicted on society by protracted and successful housebreaking. We need not make an application of this little parable. The point of it is obvious.

As regards corruption, which is, after all, the evil against which, in various forms, we are fighting, it must also be said, in explanation of Mr. Tilden's success, that people are tired of hearing it described and declaimed against. With its nature and wickedness they are, unhappily, only too familiar. What they need now is not to understand it better, but to be rid of it, or have it in some manner abated. Mr. Conkling has told us how it is "a pestilence that wasteth at noonday," an animal "with a stealthy creep, a leprous touch, and deadly breath, which wastes and rots fair fabrics," and "a sea-bird which blasts trees by building its nest on them." Other gifted orators have described it as "a upas-tree," and as "slime" and "mire" and "a canker" and an "open sore" and "a turbid stream" and a "vortex"—in fact, there is no end to the imagery and epithets which have been expended on it, and apparently not without effect. You could not from Maine to California find a man who would defend corruption or approve of it, or refuse to join in denunciations of it. In short, it may be said that the American people is, and has been for many years, fully satisfied that corruption is a bad thing. It has been, therefore, for some time increasingly trying to the temper of the average man to find Republican orators rising steadily, day in and day out, year after year, to offer a few remarks showing its dangers and evils, and giving reasons why Republicans ought not to be guilty of it, and then pooh-poohing the idea that any Republican *is* guilty of it, and resisting all attempts to discover whether he is or not. What the country demands now is the detection and punishment of the persons who make corruption. Nobody's rhetoric has yet succeeded in persuading people that corruption is really a plant or a bird or a fish or a river. They know perfectly well that corruption is a certain species of conduct pursued by certain men, and they know that if the men could be reached and punished corruption would cease, and they are willing that anybody who will try to reach and punish them should "make capital" out of it. In fact, they go so far as to say that to make capital in this way is a good thing to do, and they wish all politicians to engage in it. They are ready to forbear all curious enquiries into the motives or antecedents of men who will undertake to put an end to cheating and stealing. In fact, the voters of the country are sticking notices up offering the highest offices in their gift, and "no questions asked," to anybody who will bring in a few plunderers of the state. Mr. Tilden has achieved his present success simply owing to his having before anybody else of his class understood the exact nature of the situation. He perceived sooner than his competitors that the time had come to stop preaching and to begin making arrests and drawing up indictments. He now finds, and his competitors find, that his acuteness has rendered him the highest service, and his enemies actually play into his hands. While the Republican press is questioning his motives, he is actually putting the leading members of the Canal Ring on trial, and explaining to the public their way of working. While Republican conventions are passing eulogistic resolutions in honor of the friend and companion of Boss Shepherd, the Democratic candidate is handing the New York "Bosses" by the half-dozen over to the police. In fact, he is "making capital" in a way in which the country desires "capital" to be

made, and assuredly, unless his opponents receive a sudden and great access of wisdom, he will have his reward.

## THE NEXT CRISIS IN EUROPE.

COLONEL CHESNEY, the well-known English military author, has recently been writing an article in *Macmillan's Magazine*, which undoubtedly expresses the current belief of the higher military circles on the Continent, and if well founded, as it probably is, furnishes the key to a good deal that has been puzzling in the recent history of international relations, and will probably make some situations yet to come seem a good deal plainer than they would otherwise be. What he says is in substance this: that the recent little breeze of war, which unquestionably blew from the Prussian staff, was ostensibly due to alarm at the rapid increase of French armaments; but in reality the alarm was not caused by French armaments at all. The French army, as has been abundantly shown by a well-informed observer in *Blackwood's Magazine*, whose statements have attracted much attention in France, but have met with no contradiction, is in reality by no means ready for war, or likely to be, even if the military laws are fully carried out, for nine years to come, and is, therefore, neither formidable now, nor likely to be formidable to Germany for a long time, except in one contingency, which is constantly present to the mind of General von Moltke and his assistants, and to guard against which they thought of fastening a quarrel on France last spring. This contingency is an offensive and defensive alliance between France and Russia, which is the only possible military combination that now gives the Prussian staff any anxiety. Of their ability to overthrow any single European power, or any two powers except those we have named, Colonel Chesney does not think there is any doubt at the Prussian headquarters. They would enter on a war with Russia feeling as certain of their ability to dictate peace at Moscow as, in a war with France, they would feel of dictating peace in Paris; but if they had, while marching on Moscow, to meet also an attack on the side of the Rhine, even from a foe they despise as much as they despise the French, the crisis would, they freely admit, be a grave one. Their information, of course, about all European armies is almost perfect. They know, it is safe to say, as much as anybody knows as to the disposable force of every European power, as to its drill, armament, organization, morale, transport, and commissariat service, and they view foreign armies without the illusions bred and kept up by patriotism or national vanity. Colonel Chesney, indeed, truly says of this Prussian staff, "that it is the most highly trained in the world's history, and if the body of officers it controls are not the men of science they are popularly imagined, they are, within the strict limits of their profession, more efficient than any power has possessed since Rome conquered the world. If she [Germany] has no leader yet named specially as fit to wear the mantle of the veteran whom age must soon unfit for the duties of the field, the system he will bequeath is so perfect in its working that it can afford to dispense with the aid of specially great genius."

We described, during the Franco-German war, the process by which this remarkable body of officers is recruited. We cannot again go into the details; but it may suffice to say that the chance of entering the staff is open to all the officers of the army on condition of passing a peculiarly searching examination, and that, after this has been passed, the candidate spends either six months or a year doing all kinds of work on probation, and being all the time the subject of close though silent scrutiny, both as to bodily and mental powers, attainments, character, and capacity, and at the end of this period goes back to his regiment entirely ignorant of the impression he has made. If he has not come up in all respects to the required standard, he hears nothing more. If he has come up to it, he finds himself some fine day suddenly summoned to Berlin again, and there he remains for good. When it is considered that the men thus selected are picked out from a remarkably studious, highly-trained class of the most highly instructed community in the world, and are animated by a devotion to the profession and government such as one meets with now nowhere else, and that all their powers and accomplishments are applied to bringing German powers of offence up to the highest point of efficiency, it is easy to see that the German staff is probably the most formidable weapon ever wielded by any government. One result of its capacity is that the opinion of one of General von Moltke's officers about the condition of any European army, or its composition, is probably more valuable than that of any of the officers of the army itself. Some people may perhaps imagine, with the memory of Napoleon's great failure in their minds, that the notion that the Germans could march to Moscow is chimerical. But it must not be forgotten that the railways and telegraphs have so changed the conditions of modern warfare that they have completely deprived Russia of the impenetrability which in 1812 she derived from her vast distances, and which constituted her strongest defence against invasion. In fact, there can be hardly a doubt that the German staff has already figured out the number of cars and locomotives necessary to supply the German army during a march on Moscow and a winter's occupation. What was Napoleon's greatest difficulty is, in fact, no difficulty at all to them. The problem they have to solve is simply the defeat of the Russian army in the open field.

But why should Germany and Russia fight? Why should there be any danger that the latter will call on France to aid her in an attack on the new Empire? This is a question which can hardly be answered at the end of an article, if indeed it could be answered in a dozen articles. Perhaps to people who do not know the passion for military supremacy which history, tradition, social organization and great armaments keep alive on the Continent of Europe, it cannot be answered at all. There are certain political ideals which have a powerful hold on the European imagination which can hardly be successfully described to an American audience, so far have we drifted away from them in thought and deed; and yet an explanation of the causes of Russian and German hostility would require a discussion of them, as well as a summary of the history of Eastern Europe during the last century. The rise of Germany into a united military power of the first order is, to put the matter in as brief compass as possible, a sudden, unexpected, and formidable obstacle to the successful pursuit of a policy which has now for several generations fascinated the Russians. It makes their further progress southward for the first time since Catharine the Great seem doubtful. It makes the ultimate fate of Constantinople very doubtful also, and, in fact, takes away from the Czar that final word in Eastern difficulties which has been so long his prerogative. For this the late progress in Central Asia is no compensation. That the Russian people will accept this exclusion from control on the Danube, or, in other words, lay aside the dreams and ambition of more than a hundred years, is very unlikely; that Germany will abate one jot or tittle of any pretensions she now has, is more unlikely still. In that very entertaining series of articles on Bismarck and his policy which M. Julian Klaczko has been publishing in the *Revue des Deux Mondes*, he describes the Prince as saying on one occasion that he left England out of his calculations in dealing with Continental politics from the time she gave up the Ionian Islands to Greece, "because a nation which ceases to take and begins to surrender is lost." That the spirit of this speech thoroughly animates the New Empire, that Germany believes thoroughly in her own mission to be the controlling influence, the civilizer and organizer of Eastern Europe, and will now never allow any one to share the function with her, there can be little doubt, and just as little that this view of her destiny will some day, and probably soon, bring her into collision with Russia. For that collision those Frenchmen who still dream of vengeance are undoubtedly waiting; so that the cloud which hangs over the German future lies not in the prospect of a collision with France alone, or Russia alone, but with France and Russia united, and what the Prussian staff debate with themselves is, whether it would not be better to put France *hors de combat* before the fighting begins.

The troubles in Turkey naturally increase the interest of the problem, and the delicacy of the relations of the two great powers accounts also in the main for the exceeding reluctance of all parties to bring any pressure to bear on the Porte apropos of the recent troubles in Herzegovina. Nobody likes to precipitate what may be the most tremendous crisis in European affairs since the French Revolution, and least of all the two parties most interested, for neither is ready. All are still busy with their army organization, their fortifications and their armaments; and their absorption in the work throws a strange light on the labors of the jurists and philanthropists who are now trying to draw up a code of international law at the Hague.

## THE REPUBLICAN FAILURE IN MASSACHUSETTS.

WORCESTER, September 29, 1875.

THE Convention which has just adjourned was rather more remarkable for the respectability of its general behavior and the representative character of its delegates than for anything else. In this respect it was very different from the noisy and excited bodies which, during the Butler period, used to congregate at this time of year in Mechanics' Hall to nominate a Governor. There was no outside crowd of "poor boys" and "soldiers"; the candidates were not running about the floor of the Convention urging on their followers, or drumming up new recruits, or voting on their own behalf. The Convention was presided over, during part of the day, by the Vice-President of the United States; there were no unseemly contests over the seats; the Chairman of the Committee on Resolutions was one of the two senators of the State; and there was no disorder of any kind, if a speech made by a slightly intoxicated lobbyist be excepted, and to that the Convention listened with good-nature, apparently because it is really so difficult to distinguish between the rhetorical excitement caused by the fumes of wine and that induced by an access of "politics." As a delegate remarked to me, it was a good representative Massachusetts convention, and "it was not likely that *these* representatives of the people had been picking the pocket of Vice-President Wilson on their way in the cars." Nevertheless, though the Convention wanted that sort of interest which Butler had succeeded in giving to those in which he had been the prominent figure, it had an interest of its own from the attempt made to nominate Mr. Adams, and the light which the proceedings seemed to throw on the present condition of mind of the Republican party in the leading Republican State.

It was, in the first place, clear enough that the nomination of Mr. Adams might have been secured by his friends, for the Adams vote was not, as might have been expected, thrown by aristocrats, bondholders, and "blear-eyed pedants," but was a vote made up by delegates from all parts of the State, and in great measure from the western counties; and, if a conjecture may be hazarded, the popularity of his name in these counties was due to the same causes that have made him such a prominent newspaper candidate at various times—his character, his family reputation, and the general distinction of his career. The western part of Massachusetts is, of course, much more genuinely democratic and rural in its character than the eastern, where wealth has brought a separation of classes in its train; and it is curious to notice, therefore, that it was exactly in this more primitive, and in a certain sense more American, community that Mr. Adams's strength lay, while the Boston delegation, who of course were the most "aristocratic" and "exclusive," and of the class which demagogues would make out the natural confederates of men like Mr. Adams, voted almost solidly for Mr. A. H. Rice. In other words, it was clear that the Adams movement was, exactly what no one would have supposed it to be, a spontaneous movement of an extremely popular character. The politicians were, generally speaking, dead against it. As a curiosity in politics, it may be mentioned that the most prominent leader of it, who worked most prominently on behalf of it, and fired the hearts of the Adams party the night before, was a Cambridge professor—a kind of champion who, any one versed in Massachusetts politics would have told you, would be more dangerous than the bitterest enemy; and yet, after this damnable conspiracy between the Adams party and Harvard College was made manifest, the Adams vote, which was estimated at about a hundred on the day before the Convention, actually swelled to 236 on the first, and to 260 on the final vote.

To a looker-on at Worcester, it was comical to see how deeply the politicians felt the necessity of doing something to "bring the party up to a higher level," and how utterly devoid they all were of any idea as to what was to be done. One thing they were determined to do, and that was to follow strictly the advice given by the venerable presiding officer, to be "harmonious," not to "alienate," not to let "discord" and "bickerings" "rend the counsels of the party," and to "open the doors." All these objects were achieved. Harmony reigned supreme throughout the day. There was not in the opening speech of Mr. Wilson a single sentence at which any mortal man, or woman either for that matter, could take offence; all the speeches made were harmonious. The Rice men all shouted harmoniously for Rice when they voted, and the Loring men all went harmoniously over to Rice as soon as they became convinced that Loring was not going to get the nomination. It was with entire harmony that the Convention made Rice's nomination unanimous, and in the platform there is not an unharmonious line. Indeed, to show the admirable spirit which presided over all the details of the day's work, it may be mentioned that even in the secret conclaves of the Committee on Resolutions there were no bickerings; but as three different sets of resolutions had been drawn up, they were all harmoniously adopted, and worked together into a platform which harmoniously triumphed not only over mere party divisions, but over grammar and intelligibility as well. Fears were entertained that over the third-term question discord might break forth; but even here harmony was preserved by the insertion of an anti-third-term resolution with one hand and a gratitude-to-Grant plank with the other, and so nicely were they mortised together that the enthusiasm over the protest against General Grant's ever being President again was only surpassed by that which burst forth at the mention of his glorious services in the past seven years. Indeed, it is an interesting evidence of the "magnetism" of General Grant that this resolution should have brought out more applause than any other which was read, while the plank introduced by the injudicious Mr. Dawes, advocating the reform of the civil service (now definitely abandoned by General Grant), was received in dead silence.

On only one subject did the Convention show any signs of a disposition to neglect the advice of Mr. Wilson, and that was when Mr. George F. Hoar of Worcester made a speech from the platform, in which he declared that it was now time for honest men to speak boldly and say what they thought; that the reason why the Republican party was reduced to its present pass was because it had neglected to walk in the strait and narrow path, that great principles had been neglected, little men put forward, and good men neglected; and that therefore he, standing there alone and unterrified, was ready, at the sacrifice of all he held most dear to him, to "lift the party up" by moving once more that eleven members at large be nominated by the presiding officer to the State Central Committee. The committee was now forty in number; let eleven more be added "at large," or let the party sink into the quagmire of humiliation and defeat. The storm which this proposal brought out was terrible to see. A shade rather of sorrow than of anger passed over the features of the venerable president as a delegate jumped upon his feet, denounced the proposal as one intended to enslave a free people, and suggested that the eleven members at large were already agreed upon, and now in the hands of the Chair or Mr. Hoar; and for a few minutes discord threatened to prevail. But the motion was carried, and no bad effect will probably ensue, though it seemed at one time as if a permanent blight was likely to be thrown over the career of the mover of the resolution by his reckless sacrifice of everything to the higher interest of the party.

If complete harmony, mutual admiration, and self-satisfaction be the objects of a party's existence, the Worcester Convention was an eminent success. There was but one voice among the delegates, and that was one of thankfulness and congratulation that everything had passed off so well. To an outsider, this was the most singular thing about the Convention. There is now a calm confidence of victory on the part of the Republican politicians of the State which is almost startling. I asked one of the chief officers of the Convention what was the Republican explanation of the election last year of a Democratic Governor in a State which had been known to go the other way by seventy thousand majority. He said very frankly that it was the dissatisfaction of the Republicans with the behavior and character of leading men of their own party, but nevertheless he felt certain that this year no such causes would be operative. The effect of the nomination outside the State did not seem to have suggested itself to the leaders at all. The question of prohibition and license (which may decide the election, inasmuch as the State Temperance Alliance is opposed to Rice, and the liquor-sellers are in favor of Gaston) was simply ignored, and it was impossible not to feel throughout that the delegates were all possessed with a harmless monomania that the Republican party, whoever it nominates, *is* the State of Massachusetts. And yet not a single one of the questions which will really decide the election—the liquor question, the labor question, the disgust with the jobbery, fraud, and peculation at Washington, and weariness of Grant himself—was even discussed in the Convention,

or, I am willing to add, noticed in committee-rooms. Indeed, not to put too fine a point upon it, the Convention as a whole struck an observer who was there simply as a looker-on as a sort of Fools' Paradise, the happy denizens of which had made up their minds that the troubles of life were over provided they only unanimously and harmoniously shut their eyes to them.

Perhaps this frame of mind was shown as well in the other nominations as in the principal one. It was plain that, having put up a mediocre man for Governor, and disheartened and disgusted the friends of a distinguished man, and thrown cold water on the hopes of many of the best friends of the party outside the State, shrewd managers would have made a point of filling the other places on the ticket with the best names they could possibly find—particularly as General Bartlett, well known to have considerable popularity in the western part of the State, and indeed throughout the whole of it, and that, too, among Republican voters, had just been nominated by the Democrats. But this did not seem to have occurred to any one. Most of the officers nominated were men of no particular weight, and in the case of Secretary of State a most amusing performance came off. The office is chiefly a clerical one, requiring a man of education and presentability to fill it; for the past seventeen years or so it has been filled by Mr. Oliver Warner. In a moment of weakness or confusion, Mr. Warner, who was also member of a commission of some kind on the State-House furniture, first as commissioner had condemned, and then as a private person and householder removed, a State-House carpet and appropriated it to his own use. It was of course impossible for a party of purification and reform, which was going to "lift itself up to a higher level," to renominate such a man; and here was evidently an opportunity to show the Democrats what "reform within the party lines" really meant. To do this, then, up rises General Coggswell of Salem, and in stentorian tones nominates for the place Henry B. Peirce, of Abington, on the ground that he is a young man—"an element," as the General beautifully observed, "too often neglected in our earnestness"—and a "soldier." When we add to these remarkable qualifications for a clerical office the fact that Mr. Peirce's proposer is, rightly or wrongly, generally spoken of as an old "Butler man," it is easy to see what a tower of strength his name will be to his party. Of course he was nominated without the slightest difficulty.

I may mention in conclusion that I have called the attention of several Republicans to these peculiarities of the proceedings, and they agree with me in my view of them; but when I ask them who is going to be the next Governor of Massachusetts, they say with one voice: Alexander H. Rice. Whether he is or not, I do not myself prophesy, preferring to follow the advice given on such matters by that astute statesman, Hosea Biglow, who laid it down as a general rule: "Don't never prophesy—onless ye know."

## OUR FINANCIAL PROBLEM AS SEEN ABROAD.

[THE following letter from Mr. Latham, now a director, and from 1859 to 1863 deputy-governor and governor of the Bank of England, was addressed to Mr. Collet, a brother director, and has come into our hands, with permission to publish it. As the opinion of a leading foreign financier on some topics which are now interesting our public in the highest degree, it is well worth perusal.]

LONDON, June 8, 1875.

MY DEAR COLLET: The dissertation of Mr. David A. Wells on gold and paper, or, as it is entitled, 'The Cremation Theory of Specie Resumption,' is most interesting. I am much obliged to you for giving me the opportunity of reading it, as I have done more than once, and very carefully.

I believe, indeed, I might almost say I know, through my correspondence with the late Mr. Samuel Hooper, that when Mr. Chase, for the support of the war, advised the issuing of the greenbacks, and the declaring them to be "lawful money," it was his intention that at the return of peace they should be not only reduced in amount, but, as soon as practicable, entirely redeemed, so as to render the national-bank notes, in common with coins of gold and silver, the only "lawful money" of the United States.

Mr. Wells, I observe, in all instances employs the term "legal tender" as if it was synonymous with that of "lawful money," whereas they are very different things. Mr. Chase was lawyer enough to know that to declare a piece of paper to be "lawful money" in such sense as to vest it with the power of discharging debts previously contracted in gold and silver (against the will of the creditor) was rather a despotic act. I do not mean that it was not justified by the extraordinary emergencies of the moment, such as the antecedent suspension of specie payments, in defiance of the law, by all the banks, the absence of any adequate machinery for raising and collecting taxes, the urgent want of immediate funds for war purposes, and so on; but it was a strong measure, in comparison with which the measures of Mr. Pitt in 1797—that is, the Order in Council which restricted the Bank of England from paying its notes in specie, and the legislation which afterwards gave to them the quality of "legal tender," were of a much milder nature—less arbitrary, less impolitic; and, consequently, at the end of the war the expediency of resuming payments in specie could be more easily established in Parliament, and Sir Robert Peel's Act of 1819 disposed of all questions simply by removing the restriction on the Bank of England of 1797, and by reconstituting the national money of time past.

The right interpretation of the term "legal tender," as it is applicable to this country, was brought out in a debate in the House of Lords on the 27th of June, 1811, as may be found in the 'Annual Register' for that year, pages 80 to 88. It means, and did mean, no more than this: that in a suit between creditor and debtor, if judgment went against the debtor, he was allowed to plead a tender of bank-notes in arrest of execution, but he could not claim that the notes should be forced upon the creditor in discharge of the debt. In certain cases of old contracts, Lord King had refused to accept bank-notes at their nominal value, and in so doing he contended "that he had not only acted legally [for of that there was no question] but according to every principle of equity and justice," and he carried his point. It is well not to lose sight of this peculiar distinction between our paper-money when it was at its worst and the paper-money of all other countries, not omitting that of our cousins across the Atlantic, who are prone to tell us that they had only done that which we had done before them.

In Greville's 'Memoirs,' Vol. III., page 271, a remark of the Duke of Wellington is mentioned not inappropriate to this subject. In allusion to the Spanish War, he said "that no doubt the army had been much in want of money, but that this was not the fault of the Government; it was a great mistake to suppose that any advantage had been derived as to obtaining funds from the Bank restriction; certainly, the raising of loans was facilitated by it, but the war would have been much less expensive without it."

As the enlightenment of the American public is the chief aim of Mr. Wells's essay, it might aid his purpose somewhat to point out to his countrymen the enormous advantage in character and in wealth which this country has derived by a course of monetary legislation exactly the opposite of theirs—that is, by resuming specie payments according to the ancient standard of value, no matter at what cost, and by afterwards maintaining them with fidelity so inflexible, that when a few years ago it was proposed by Mr. Lowe to strike off a single grain of gold from the sovereign, the good sense of the nation was instantly aroused to indignation, and most rightly—for the sovereign, which is the pound sterling, is our money; it is the measure, the radix, not only of transactions of the butcher and the grocer with his customer, but of the transactions, antecedent and to come, of foreign governments with their creditors, who have always refused to be talked to in dollars or francs. They say, "No, you must express your bonds and your coupons in pounds sterling payable in London; then we know what we are about." Again, what supercargo or shipmaster could pass a bill in China, India, or Australia on a merchant in New York, to any advantage, unless expressed in English money payable in London? Thus, therefore, in relation to affairs abroad, may a people be said to be "sent to Coventry" through the errors of its government, and its undertakings in trade are made chargeable with a toll in London because that is the only place where a true measure of property and debts can be relied on. A source of profit this to the London merchants and bankers, a source of pride perhaps to the British legislature; yet it is no slight stigma on those governments which compel their own subjects to submit to so unnecessary a *tax*—and what else is it?

It occurs to me that there must be other losses, not mentioned in Mr. Wells's essay, to which the American nation must be subjected by the continuous debasement of its money—for undoubtedly it is debasement; a circulating paper money that cannot be refused in payment of debts is just as much debased by its own excess as a coin of gold or silver would be by an extra infusion of brass. The customs duties, I am aware, are paid in gold; but the Government, which is in fact the state, must suffer in the notes they collect for the excise or internal duties, and still more for the sale of the public lands. In local taxation it must be the same; and, worst of all, in every variety of contract between man and man, the at first progressive depreciation and afterwards repeated fluctuations in the currency—that is, paper money—of the United States must have wrought an enormous amount of injustice.

Mr. Hooper sent me many of the speeches, especially of Mr. John Sher-

man and of Mr. Carl Schurz, which are excellent, in the Congress of 1873–74. The President's Message to the same Congress it is rather painful to read, because, while he recommends an early resumption of specie payments, he strangely wanders from his own advice by saying that the currency, based as it was on the credit of the country, had been proved by the experience of the panic to be the best that ever was devised, and he adverts with peculiar delight to the merit which a circulating medium derives from its quality of elasticity; just as if any public good could be achieved through the lawful money of the country being affected by frequent and sharp changes in its degree of debasement, which is absurd. So much is the contrary the fact, that every new debasement of the notes is a fraud and robbery upon those who hold them. There is, to be sure, a species of elasticity in all composite moneys of metal and paper, but the merit of such elasticity belongs exclusively to the metallic portion, in respect of the facility with which gold or silver leaves a country, or returns to it, according to the condition of its commercial relations with all other countries.

Mr. Wells puts the whole matter of the "greenbacks" with more clearness as well as brevity than that of the Presidential Message, where he says "the thing to be done is simply to pay off and extinguish an overdue debt of $382,000,000." That, no doubt, will set the Government right with the people, but there will still remain the task, if I am not deceived, of setting the people right with relation to the national banks in their, as we should call it, issue department.

Over and above the 382 millions of greenbacks, it would appear, by Mr. Wells's paper, page 13, that there are 368 millions of national-bank notes circulated all over the Union by, I believe, not less in number than 1,800 banks. Am I right in assuming that by the theory of "free banking" now distinctly announced by the President, these banks may be increased in number, and that any one of them may increase its issues, provided the requirements of a certain law are observed, to the effect of lodging state [national] securities with the Government officer, who gives in exchange the legal proportion of notes in blank, stamped on the back in a manner to signify that such law had been complied with?

In Mr. Wells's paragraph on the future of the national-bank issues, page 12, it is said that, "in proportion as the volume of legal tenders (greenbacks) is diminished by cremation, the banks must have gold with which to redeem their notes." Now here it is, and here only, that I find myself at issue with Mr. Wells, as the argument seems to assume that all the greenbacks are held by the national banks as their reserves. Many of them, no doubt, they must hold, just as our country bankers must hold some sovereigns and some Bank-of-England notes to answer to the holders of their own notes, or to their depositors; but I am inclined to think that, as the greenbacks are extinguished, the likelier event is that their place will be occupied, to a great extent, by an abundant outflow and expansion of the notes of the national banks, and that the tendency of "free banking" such as this will be to bring about loans at high interest, both of note-money and deposit-money, until the fabric of credit will again collapse, and a new suspension occur of specie payments, through a concerted action of the national banks. That is just what had nearly happened here in 1825, in spite of the Act of 1819, and might have happened again and again afterwards except for the Act of 1844, when all banks of issue were fastened to a maximum, once and for all. Since then our mixed money has been continuously on the mend from the larger introduction of the gold element, and the partial expulsion of the paper element through failure or withdrawal of the issuers. It is true that the tax and the deposit of security to be taken from the national banks will act as some restraint, but not enough. It will go to raise the price of loans, but a rash speculator or a needy trader seldom higgles much on that score, and too often the relations between banker and borrower are such that the new loan must be made as a choice of evils.

Did it belong to me to make a suggestion, I should be inclined to say that a surer and a better way of maintaining the tenure of a large amount of gold and silver within the country would be to attach a high minimum to the denomination of all bank-notes whatever, as was done in France by the able legislators of 1803, or thereabouts, after the collapse of the assignats. In my own recollection, the lowest denomination of Bank-of-France notes was 500 francs, or £20 sterling; and I have often thought that if the lowest denomination for bank-notes in England were to be £10, in place of £5, it would be all the better. In any country, no matter where, if it is wished to retain coins of gold and silver at home, more dependence is to be placed on the hoards and pockets of the people than on the coffers of the banks. Bankers will not keep adequate reserves.

I remain, my dear Collet, faithfully yours,

ALFRED LATHAM.

## THE UNIVERSITY OF STRASBOURG.

PONTRESINA, August 31.

I RECEIVED my classical education in Strasbourg, and having lately spent a few days in that city, I had the curiosity to enquire into the actual state of its university. The conquerors were not content with building a long circle of forts round the old walls, in order the better to defend their conquest, they were anxious to introduce into Strasbourg what they proudly call German culture, and much money has been lavished on the new university. In the days when Strasbourg still belonged to France, there was a so-called *collége*, a huge building, which is in the shadow of the great cathedral. It is now called a gymnasium, but is not much altered in its appearance. It still bears the conventual look of all French colleges. There I spent the days of my childhood, looking often from my window on the proud spire of the cathedral. The venerable oak which is in the centre of the court is still there; the rooms are the same; the long corridors, the dormitories, the refectory, are not altered.

After a boy had gone through the college course and passed his examination for bachelor of arts, he used to follow the lectures of some faculty in the university. The buildings of the university are across the Ill, not far from the citadel, in a deserted quarter. They have been a little improved, but have not changed much in their appearance. Great laboratories have been built; more room has been given to the mineralogical and botanical collection; but the principal addition of the new German university has been the beautiful palace built on the square of the cathedral, in the eighteenth century, which was for a long time the episcopal palace. Nothing can be imagined more beautiful than this square, though the styles of architecture are somewhat incongruous. On one side is the nave of the cathedral; on another, the old massive Lyceum; on the third, the episcopal palace, adorned in the style of the eighteenth century with *rococo* statues; and in the same line the *Œuvre Notre Dame*, a house, half Gothic and half Renaissance, which is the property and the headquarters of the corporation that spends its large revenue (something like £8,000) in the repairs of the cathedral; the fourth side is filled with a new building, which has been made the German post-office. The episcopal palace has become the centre of the German university. The city of Strasbourg, in order probably to throw off the burden of its repairs, had made a present of it to the young Prince Imperial during the days of the Second Empire, and the Germans have appropriated it for their new university.

The lectures of the university take place, some in the old academical buildings, some in the episcopal palace, some in the buildings annexed to the great hospitals of the towns. I was very curious to know what had become the standard of German culture since the days that I spent at Heidelberg in my youth, when I was innocently singing German songs in the *Kneipe* of that famous town, little thinking that some of these songs would be the death-knell of my poor country. I was not much surprised to find that *Theologie* was still holding its own, as you will judge by the programme of the lectures delivered in the winter months of 1874. Here are the items of this theological repast: "Special introduction to the Old Testament; explanation of Isaiah; history of the literature of the New Testament; history of the canons and of the text of the New Testament; Catholic epistles; lesser Paulinian epistles; history of the dogmas of the Church in the sixth century; history of the Church since Innocent III. to the nineteenth century; Christian archæology; history of the Protestant theology; dogmatics, second part; ethics; homiletics." Then come the *privatissimæ* lectures of a so-called theological society, a dogmatic seminary, and a homiletic seminary. For all these public and private lectures there are as many as ten professors.

A second series of lectures goes under the name of law and state-sciences. The law lectures embrace the following subjects: "Philosophy of law; introduction to the study of law; study of the laws of the German Empire; the Pandects; study of the law of inheritance as a part of the Pandects; the law of inheritance under the Romans; history of the Romano-Germanic law to Charlemagne; history of the civil procedures of the Romans; history of the German law; the law of contracts in Germany; commercial and maritime law; French civil law; Prussian civil law; criminal law; German public law; international law; church laws in Catholic and Protestant countries; on political parties and their connection with the laws; private lectures on Roman law; *privatissimæ* lectures on Roman and Prussian laws." The state-sciences afford the following programme: "General politics; practical national economy; history of the development of the Prussian state from 1640 to 1850." There is, besides, a law seminary, where the professors study "the interpretation of the Pandects; the practice of civil procedure; the practice of the Pandects;

the exegesis of Gaius"; and a seminary of state-sciences, at which lectures are given on "national economical subjects" and on "statistics." I find on this list as many as sixteen professors. The medical sciences are represented by forty-nine series of lectures, the list of which would be tedious to your readers. Then come what the Germans call, after the old denomination of the Middle Ages, the *humanities*, which relate to philosophy, philology, history, and art. As this part of the programme may be considered as more especially representing German culture, I will give you an idea of it. A young student who has a taste for philosophy can follow lectures on "the basis of the theory of knowledge; on psychology; on the history of modern philosophy; on Descartes, Spinoza, and Leibnitz; on the objections made by Herbart, Schopenhauer, and J. S. Mill against the theories of Kant; on the philosophy of Kant; on pedagogical science since the age of Pericles; on Goethe's Faust, considered in its philosophic aspects." The philologist can plunge into Arabic, Arabian classics, Arabian geographers, into Hebrew, Persian, Syriac, Sanskrit, Pali, Greek, Latin, Romanic languages, French, Italian, Scandinavian, Old German, etc. There are as many as forty-nine courses of lectures under the single heading of philology.

I have heard it said that some of the privates of the German army carried Sanskrit books in their knapsacks during the late war; and I could not help asking what lessons of humanity they found in their "humanistic" recreations. Science, after all, is only a means to an end; and I can imagine a nation stuffed with Syriac and Pali and wanting in those delicate qualities which were the attributes of Hellenic civilization, and which are in our day the blossoms and fruit of a truly Christian civilization. A young coxcomb, if he knows the Syriac or Pali grammar, may think himself too decidedly superior to the rest of mankind; and what is there, after all, in Syriac and Pali? The young King of Bavaria, who may be said to have culture enough in him for ten kings, went the other day to Rheims incognito; he wished to see the old church where the kings of France received the holy ointment. Was this visit only a caprice, and would the young and poetical vassal of the new Empire show that he knew there was something after all in the civilization which had covered France with palaces and churches, and which had found its expression in the most admirable language that the world has known since the Greek and the Latin? I wonder if the Sanskrit students have well understood the teachings of Buddha, and perceived that they were only to the teachings of Christ what a nightmare is to actual life? I would not be unjust to German science; but I cannot help thinking that there is a little too much pedantry in it. Schiller and Goethe were essentially human in their aspirations, and so was Beethoven; but modern German culture seems to envelop itself with an armor of words, of theories, and to be ready to fight all mankind. The professor who explains the Peloponnesian wars thinks he is helping Moltke; the commentator of Polybius and Tacitus is in partnership with Herr Krupp of Essen. The whole nation is uniformed and drilled and dried up.

The historical and geographical lectures are numerous; a good place, of course, is left for the wars of religion, for the wars of Prussia. The lectures on art are so numerous that the want of artistic feeling in Germany can be hardly understood. Everything is studied too much from an historical point of view; the genuine æsthetic feeling is absent. Art, after all, is not so much the fruit of mental labor as of moral and intellectual delicacy. You can write thousands of pages on the Italian painters and sculptors and have no true artistic feeling. The fifth section of the university is devoted to mathematical and scientific studies. Here the peculiar faculties of the German mind have their full scope. I could cover pages with the mere programmes of this series of lectures. Let me say a word about the organization of the various faculties. Each one has ordinary and extraordinary professors. The faculty of theology has six ordinary and two extraordinary professors. The faculty of law and social science has ten ordinary professors, three extraordinary professors, and one Privat-docent. The faculty of medicine has thirteen ordinary professors, one extraordinary, and four Privat-docenten. The faculty of philosophy has fifteen ordinary professors, one honorary, seven extraordinary professors, two Privat-docenten, and two *Lectoren* (lecturers). The faculty of mathematics and of natural sciences has ten ordinary professors, five extraordinary professors, and one Privat-docent.

No academical staff could be more numerous, and in many respects more excellent, than the staff of the new German University. I find, however, on its list no name of European reputation. Such a man as Helmholtz or Hoffmann would probably not have liked to establish himself in a newly-conquered city. The real man of science is not like the hungry functionary who comes from Pomerania to lead a more luxurious life in a beautiful and rich country. The work of conquest has so many painful sides that a sensitive mind would shrink from the contemplation of it. The students at first flocked to Strasbourg from all parts of Germany; but they also have found it unpleasant to live in a place where they saw an enemy in almost every human being. There is much pride and folly in youth; there is also a natural generosity which finds no satisfaction in the spectacle of a down-trodden people. I doubt if the German University will grow on the unfavorable soil on which it has been planted by the force of arms.

# Correspondence.

## PRIESTS AND MINISTERS.

To the Editor of The Nation:

Sir: In a recent article on "Priests and Ministers" you argue that it is "a very narrow and one-sided and misleading view" to maintain "that the interference of the Catholic clergy in politics, such as has been recently witnessed in New Jersey, was fair and unobjectionable, because the Protestant clergy did the same thing." This view is alleged to be misleading, because priest and ministers are not pastors of the same sort. The latter are American citizens, and privileged to speak on political topics. The former (by inference and antithesis) are *not* American citizens, or their citizenship is in some unexplained way so veiled as to be almost swallowed up and lost. If this be not the drift of the argument, it is difficult to understand the *logic* of conclusions such as the following: The State should not pay attention to Catholics asking for "religious liberty and equal rights." Should a Catholic ecclesiastic protest that he does not regard "the whole of our political and social fabric, our Government, etc., as a monstrous and beastly revolt against God," do not believe him—his language is Pickwickian.

As an American and a lover of impartial justice, the writer begs to sift the arguments on which the disloyalty of priests and bishops is based. First, then, the priest or bishop is the subject of a foreign prince, who claims, under certain conditions of which he alone is judge, to decide absolutely on the morality of every question of human interest.

A Catholic would reply, first, that it is false that the Pope claims this power of universal judgment; secondly, that it is false that he alone is judge of the absence or presence of the conditions necessary for dogmatic teaching. The authority for these statements is Pius IX. himself, in the dogmatic definition of the Vatican Council. The rest of the argument resolves itself as follows: Priests and bishops are subject to the Pope, in matters of faith and morals, etc., *granted;* to the exclusion of civil allegiance due to their country, *denied.* The Gladstone controversy, and the verdict of the British press generally as to the ex-Premier's complete discomfiture, are proofs of this denial.

Secondly. It is urged that the bishop or priest has no fixed domicile—is here to-day and may be off to Patagonia to-morrow; is a celibate, and therefore has diminished civil rights. By the way, Paul the Apostle was a bachelor, he traversed many countries and had no fixed abode, yet it stands recorded of him, "I am a Roman citizen."

In point of fact, where ecclesiastical law prevails, it just happens that a parish priest, once appointed, remains (except for grave crime, etc.) a fixture for life. Even where canon law does not obtain, a priest may, for reason, be removed from his parish, but not to China or Japan. He cannot be sent out of his own diocese. Thus, *e.g.*, a priest of New York City cannot be ordered to Jersey City or Brooklyn, much less Patagonia.

As to celibacy, it is historically false that it was enjoined for political purposes, simply because it prevailed before the Roman Church had any temporal power. That every lightest word of a priest, his "obiter dicta," are taken almost as hints from heaven, is very good as a *joke* but very bad history. The late New Jersey elections disprove it. Hence the old axiom comes into play: "Contra factum non valet argumentum." Logic.

[We publish the above as a matter of fair play and out of respect to the source from which it emanates, but we think we can say with all modesty that it does not call for any reply, except that upon the question of the bishop's power over the priest our correspondent speaks with an authority which we cannot dispute.—Ed. Nation.

# Notes.

A GERMAN translation of Prof. Chas. K. Adams's 'Democracy and Monarchy in France' has just appeared (Stuttgart; Auerbach). It makes a neat volume of 400 pages, the foot-notes, as we judge, having been somewhat curtailed. In his preface, Mr. Adams remarks upon the fact that the first Franco-Prussian war-maps in this country showed the Rhine and Germany instead of France and the Rhine, as proof of the general expectation that the French would carry the day. A more rational explanation seems to us to be that France was notoriously the aggressor, and therefore bound to attempt the invasion of Germany. For the latter country a purely defensive policy was not impossible, and, in the then divided state of Germany, was fairly enough assumed as probable by foreigners.——G. P. Putnam's Sons have bound up in one convenient volume 8vo, under the title of 'Library Atlas,' their several student's-atlases of Modern, Historical, and Classical Geography, the letterpress (pp. 208) being by Drs. James Bryce, William F. Collier, and Leonhard Schmitz respectively. The three place-indexes follow one another at the end, and are quite copious. While the maps are of no very high order, they answer the usual purposes of reference and study.——Hurd & Houghton have in press a new edition of the letters of Mrs. John Adams to her husband during the Revolution, to which their grandson, Charles Francis Adams, has added the corresponding letters of John Adams, and notes to the whole.——J. W. Bouton will publish next month 'Monumental Christianity; or, The Art and Symbolism of the Primitive Church as Witnesses and Teachers of the One Catholic Faith and Practice,' by John P. Lundy, Presbyter. The work is illustrated by numerous cuts and plates.

—Mr. John Eglinton Bailey, to whom, as our readers know, we are indebted for a very exhaustive and scholarly 'Life of Thomas Fuller,' has now in the press the sermons and other less extensive writings of that famous old divine. These will make up two volumes, the price of which to subscribers is fixed at a pound and five shillings. Mr. B. M. Pickering, London, is the publisher. The 'Sermon of Reformation' (a thoroughly characteristic production, by the bye) has been issued separately, as a specimen of the forthcoming work; and, in these days of tormenting typography, the bold, clear letter which is here to impress the most honest of paper is a refreshment for which the many admirers of Fuller cannot fail to be thankful. That Mr. Bailey, in his capacity of editor and annotator, will discharge his functions with conspicuous ability, may be reckoned on confidently.

—We have received from the Surgeon-General's Office the bulky report on the 'Cholera Epidemic of 1873' ordered by the Forty-third Congress. It consists of three parts—the first two freely illustrated by maps, viz.: the history of the epidemic in the United States, for the year mentioned, by Dr. Ely McClellan, U.S.A.; the history of the travels of Asiatic Cholera, by Drs. McClellan and John C. Peters; and the Bibliography of Cholera, by Dr. John S. Billings. The second part is a most valuable abstract of the whole history of the cholera—complete as far as it concerns the United States, and as complete as may be in the case of a disease which, as Dr. Peters says, is "one of the most ancient of which distinct descriptions exist," there being "few disorders respecting which such an uninterrupted chain of evidence has been preserved." The bibliography, though it does not profess to be complete, is of surprising extent, especially when it is considered that only those works or articles are named which relate mainly or entirely to cholera. It is classified, even to the special treatment of the disease (as *arsenic*, *calomel*, *phosphorus*, etc., etc.), and covers more than three hundred pages. The well-known industry of the compiler was never more strikingly manifested. A separate reprint has been made of the introductory paper, on measures for preventing the introduction of epidemic cholera in the United States through the agency of the mercantile marine, by Dr. John M. Woolworth. The yellow-fever epidemic of 1873 is described by Dr. Frank W. Reilly in the 'Report of the U. S. Marine Hospital Service for 1874,' just issued. The report is otherwise remarkable for being the first to contain, in addition to the customary statistics and comments thereon, a number of papers contributed by the corps. They are all instructive, and many of them afford matter for serious thought to those who have the welfare of society at heart.

—A work of no little usefulness and even importance has been quietly undertaken by Henry Holt & Co., being nothing less than an 'Abridgment of the Debates of Congress.' The formidable task of extracting the pith of Congressional proceedings from the tangled verbatim report of the *Congressional Record* has been successfully executed by Mr. Charles H. Jones, whose condensation of Richardson's 'Clarissa Harlowe,' and more lately of the narratives of African exploration, has furnished proof of unusual capacity for such labors. It is, indeed, no slight boon to those who desire to trace the course of a measure consecutively or to refer to a given stage of it, to have it freed from the interjections and dislocations of actual parliamentary practice, and the discussions over it stripped of verbiage and buncombe, while still preserving the exact language of the speakers; and all in a volume of some 700 pages 8vo. This has been done with judgment and impartiality by Mr. Jones for the second session of the Forty-second Congress, when the currency, specie payments, the use of the army in Louisiana, and the right of that State to self-government, and its rightful representative in the Senate, the government of the District, civil rights, the tax and tariff bill, the case of Arkansas, the admission of Colorado, the counting of electoral votes, the equalization of bounties, were the subjects of more or less honest, earnest, and intelligent debate, with results generally known to the voters of the country. It is surprising how much is given of the speeches in spite of all pruning. The volume closes with lists of acts passed, both public and private; and with the full text of the President's special messages and proclamations, the majority and minority reports of the Committee on Louisiana affairs, and an index of persons and topics. The convenience of this Abridgment to Congressmen themselves is so obvious that we do not doubt they will be the first to avail themselves of it; after them will come the editors, the public and State libraries, and, let us hope, the aspiring politician of the better sort. One great good that we may expect from it in these days of tergiversation is the increased facility with which trimmers can be detected and exposed. To hold the mirror up to Morton and Sherman and Boutwell and Thurman by overhauling their past "record" will be easier hereafter, and it is only to be regretted that Mr. Jones did not sooner put them in his index. But he is in time for the long political campaign on which we are now entering.

—Another venture of Mr. Holt's which deserves mention is a handsomely printed and bound volume called 'Family Records, in Blanks Classified on a New System.' The need of some substitute for the 'Family Bible' has been long felt. Its awkward size has, in the multiplication of cheap and handy Bibles, caused it to obey the law of the survival of the fittest, and it is now less and less regarded as an indispensable article of domestic furniture. We suppose such a thing never happened as that half-a-dozen of these ponderous tomes fell by chance or in the natural course of inheritance into the hands of a single pious descendant. Any one who has ever attempted in a large family connection to discover the 'Family Bible' of the second or third preceding generation, knows how hopeless the task is, and is convinced by experience of the impolicy of linking the fate of the family records with that of a single book, however revered or time-honored. Mr. Holt's book invites and, in a measure, compels copying from it by the several members of a family of children, for in regard to these it aims to preserve not only the date and particulars of birth, which can easily be remembered, but incidents of growth and education which each will wish to hand down to his own children. On this side the record trenches to some extent on Professor Fonssagrives's 'Mother's Register' (G. P. Putnam's Sons), to which the compiler refers those who wish for more complete and scientific and, we may add, private annals of health, sickness, and physical development. The genealogical pages afford room for as many facts and as great a display of skill in arranging them as the owner of the book possesses. Here the plan would be much improved if it were practicable to introduce between the same covers Mr. Whitmore's 'Ancestral Tablets,' with their ingenious economy of space and tempting array of blanks to be filled with yet undiscovered ancestors. These tablets once filled out as far as possible, might be deposited in some historical or genealogical library in lieu of a printed account of the family, and would be just as useful to an investigator. A few pages are devoted to "heirlooms and other possessions," and a few to "domestic economy"; but the chief space is allotted to autobiographical details and to "miscellaneous items." The compiler's prefatory explanation of the several departments is couched mostly in a jocular vein; but one may also take a serious view of any family record as a moral instrument of no slight value to society.

—A member of the New York bar writes us:

"We hear much nowadays about the extreme impropriety of criticising judicial judgments and opinions. A decision is a precedent, and we must all be dumb, say they. I have just come across a precedent for plain speech upon such subjects, and beg leave to cite Rex *v.* Wilkes, 2 Wils. 151—a matter in which it was contended that an alleged libeller should give bail for good behavior. Lord Camden says there is only one authority for the proposition contended for, and remarks concerning it that it is 'the case of the seven bishops, where three judges said that surety of the peace was required in case of libel; Judge Powell, the only honest man of the four judges, dissented, and I am bold to be of his opinion and to say that the

case is not law. Upon the whole, it is absurd to require surety of the peace in the case of a libeller.' It seems that the lawyers and editors who venture to criticise judicial opinions are not without 'authority.'"

—Mr. R. G. White, who has now for a year or more been at peace with all the philological world, shows signs, in the present series of articles in the *Galaxy* on English pronunciation, of a desire for a renewal of hostilities. In the subject which he is now engaged upon there is room for a very pretty quarrel, inasmuch as it deals, like so many linguistic discussions, with questions about which no two persons are able to agree. In the current number of the magazine, Mr. White does for himself what Professor Whitney had already done for himself in his 'Elements of English Pronunciation'—*i.e.*, he analyzes his own "peculiarities of utterance," giving at the same time a sort of phonological autobiography. Until Professor Whitney was sixteen years old he lived in Northampton, Massachusetts, which he describes as "a shire town of long standing," which in his youth "had not lost its ancient and well-established reputation as a home of 'old families' and a scene of special culture and high-bred society." To characterize this society by a single trait, "the proper distinction between *shall* and *will* was as stoutly maintained, and a slip in the use of the one for the other as rare and as immediately noticeable and offensive, as in the best society in London." His father was a "merchant and banker, not himself a college-taught man, but a son of a graduate of Harvard"; his mother "from the shore of Connecticut, her father a clergyman and a graduate of Yale." Better conditions than these for the nurture of good English speech Mr. White admits there "could not be"; and so he in turn, before criticising Professor Whitney's "peculiarities of utterance," says that he will "set it," as well as his "heavy-weight antagonist," and show the conditions under which he acquired his speech. He gives them as follows:

"To begin then at the beginning, although born and educated in New York, I am the first of my family that was so; my forefathers, for about two centuries previous, having been in the habit of getting themselves born in and about Middletown, Connecticut; this on my mother's side as well as my father's. Both my grandfathers were graduates of Yale; and my paternal grandfather, a clergyman of the Episcopal Church, with whom I passed a great deal of my boyhood, spoke, I think, the finest and richest English I ever heard. There was a slight tinge of the old days about it, given chiefly by his pronunciation of such words as 'angel,' and 'danger,' which he sounded *an-gel, dan-ger*, and by his distinct but gentle roll of the letter *r*, which however was never very marked except when he was reading prayers or from the Bible. I will add that, much as I was in Connecticut in my boyhood, I never heard, under my grandfather's roof, or that of any of his friends, that sound, best but not perfectly indicated by *aou*, which is regarded as a peculiar trait of Yankee speech. The first person among our acquaintances from whom I heard it was a lady born and bred in Philadelphia, of one of the most cultivated families there, and who was then the wife of a very eminent prelate. I was not more than eight years old at the time, but I shall never forget the impression made upon me when this refined and elegant person whined out something to my mother about 'aour caou' (our cow). My teachers, before I entered college, were both Massachusetts Yankees, one of them, I believe, from Northampton. My associations have been chiefly with New England people, or those of New England stock. I have heard English spoken more or less all my life by well-educated and well-bred Englishmen, but chiefly after I reached full manhood; the only difference that I remarked between their utterance and that of my own kinsfolk and friends being set forth in 'Words and their Uses.' I venture to think that Professor Whitney's opportunities and mine in respect to the learning of our mother tongue have been very much the same."

Notwithstanding all this, Mr. White is "surprised to learn from Professor Whitney" that "the leading orthoepists" now require a flattened sound, like the vowel sound in *fat*, or one between the sounds of *far* and *fat*, in the following words: *calm, calf, halve, aunt, alas, pass, bask, path, lath, laugh, staff, raft*, and *after*, while Mr. White himself says that he does not hesitate to declare that among all the best speakers, both of English and American birth, that he has ever met, these words all have the broad *ah* sound of *a* in *far* and *father*. This is, of course, only one instance in many, and it certainly shows the difficulty of an agreement among "leading orthoepists" as to the English vowel sounds; but we are somewhat startled by the dignified personal prelude with which the article begins, and almost fear that it is of the awful character of the calm which in nature sometimes precedes the most terrible storms, and that in the next number or so there will be terrible work among some of the leading orthoepists.

—In the other magazines there is about the usual degree of interest. *Scribner's* makes up in variety what is wanting in quality, and Dr. Holland begins to show signs of bringing his "Story of Sevenoaks" to a somewhat unnecessarily delayed end. In the *Atlantic*, the article which has probably attracted most attention, throughout New England at least, is that on "Drainage" by Mr. Waring, who is, if not an authority, a diligent reader of authorities on the subject. No better months of the year could have been selected for the appearance of these articles than September and October. Now is the time when the New Englander begins to complain of queer feelings, and calls on the doctor, and wonders what the reason is that his children and his wife sicken or die, and learns that they are having the "typhoid," or "typhoidal," or "malarial," or "intermittent" fevers; and quiet New England villages which have their drains out of order begin to get a bad name; and the correspondents of the city newspapers begin to write letters describing the symptoms of the Milhaven, or the Welboro, or the Draintown, or the Cesspool Centre fever. The Massachusetts Board of Health have investigated the subject thoroughly, as have certain reformers in England, and it has been shown conclusively that these diseases come, in nine cases out of ten, from defective drainage, from the communications between drains and wells, and from foul air escaping from drains. The fevers have nothing to do with localities, except as localities are affected by these causes, and it has been proved by the English statistics of mortality that the death-rate can be immediately and effectually reduced by the introduction of proper drainage in a given town. The Massachusetts Board of Health calculate that $50,000,000 could be sunk in drainage by Massachusetts without loss, from the greater effectiveness of labor which would be caused by the generally improved tone of health.

—With Catholic and Confederate text-books for the right instruction of youth we are not unfamiliar. Has the Holy Farmer been equally alive to the necessity of outplanting in the common schools the pernicious tares of the railroad bondholder? If not, let him take a lesson from the Inflationist also. We have before us a leaf or two from a 'History of the United States, prepared especially for schools on a new and comprehensive plan,' by John Clarke Ridpath, A.M., Professor of Belles-lettres and History in Indiana Asbury University. Its publishers profess to have branches in Cincinnati, Philadelphia, St. Louis, Chicago, Memphis, and Atlanta, and evidently count upon its having a wide circulation. Southern readers have their susceptibilities saved by such an account of Charles Sumner as that he succeeded Webster in the Senate in 1850, and "retained this position until the time of his death, speaking much and powerfully on all the great questions that agitated the nation. His last days were spent in considering the interests and welfare of the country." Here neither slavery is mentioned nor the civil war. But on the subject of the currency our Indiana professor, as in duty bound, is not mealy-mouthed. The panic of 1873 he traces neither to the railroad speculator, nor to the Granger baron, nor to the paper dollar. Here is his simple explanation of it in full (p. 470). A child can understand it:

"In the autumn of 1873 occurred one of the most disastrous financial panics known in the history of the United States. The alarm was given by the failure of the great banking-house of Jay Cooke & Co. of Philadelphia. Other failures followed in rapid succession. Depositors everywhere hurried to the banks and withdrew their money and securities. Business was suddenly paralyzed, and many months elapsed before confidence was sufficiently restored to enable merchants and bankers to engage in the usual transactions of trade. *The leading cause of the panic was the scarcity of money occasioned by the contraction of the national currency*, which had been reduced from six hundred and ninety-nine millions of dollars in 1865 to three hundred and forty-seven millions in 1873."

In the second edition of this precious text-book it would be well to state in a foot-note to the above passage that the legal-tenders alone in 1873 amounted to $356,000,000, while the sum of legal-tenders, national-bank notes, and fractional currency exceeded $740,000,000, against somewhat less than $629,000,000 in 1865. Meantime, we call the attention of the government of the university to this gross blundering, and suggest that it calls for some action on their part.

—The well-known series of 'Geschichte der europäischen Staaten,' edited by Heeren and Ukert, has been resumed after a suspension of some years, and is to be pushed vigorously forward under the editorship of the distinguished historian Giesebrecht. The thirty-sixth instalment, published this year, contains the fifth volume of Carlson's 'History of Sweden' and the fourth of Caro's 'History of Poland.' Carlson's work (a continuation of Geijer) reaches the death of Charles XI. (1697). The 'History of Poland' has also changed hands in its course. The first volume, by Dr. Richard Roepell (1840), ranked as one of the very best of the series; it ended with the year 1300. After his death, this work was suspended until 1863, when the second volume was issued by Dr. Jacob Caro, of Breslau, who has since followed it with the third and fourth. The present volume embraces the period from 1430 to 1455—the closing years of Ladislas II. (Jagiello), the reign of Ladislas III., and the commencement of the reign of Casimir IV. The somewhat arbitrary date of its close (1455) is selected as being that of the death of Cardinal Zbigniew Olesnicki, whose career, says the historian (p. 470) "marks a disastrous turning-point in the history of Poland." This man appears to have been a great turbulent prelate of the

class of Dunstan and Becket, and his policy is characterized as "the emasculation of the royalty, whose vigor perhaps no nation, from its natural position, needed more pressingly than the Polish." The merit of "schoolmastering" kings was, he remarks, cheaply got when these kings were "mild and benevolent like Ladislas Jagiello, pious and enthusiastic like Ladislas Warneńczyk, and noble and kind-hearted like Casimir." The volume treats largely of Lithuanian affairs, largely also of the contemporary disturbances in Bohemia; its central incident is the battle of Varna (1444), against the Turks, in which the zealous Ladislas III. lost his life.

## NADAL'S IMPRESSIONS OF ENGLAND.*

MR. NADAL'S subject is interesting and suggestive, and might be made an occasion for discussing a great many things. His opportunity, too, for making himself acquainted with it appears to have been enviable—he was, we believe, attached to the American Legation in London. London society is a very vast and complex affair, and an observant American, steeped in it for a couple of years, can hardly fail to gather a number of impressions which are worth being formulated. There has lately been a good deal of ratiocination upon "society" in America—a discussion which has not advanced so far that it may not be illuminated in some degree by the testimony of other climes. It has not yet even been settled whether we possess the thing so called; opinions vary, but the negative view seems to be found most convenient. It is, however, rather dolefully held by most of its advocates, who think that the melancholy void in question should be filled up with all possible speed. All definite information, then, as to the characteristics of a society which is acknowledged to be a very ripe and substantial specimen of its genus should be welcomed and pondered, so that we may be either consoled or enlightened; instructed as to what to aim at and as to what to avoid. "One felt," says Mr. Nadal, "that here was company which, however it might be in Saturn or Jupiter, no set of tellurians at least could affect to despise. You enjoyed this sensation. All round this wide planet, through the continents and the islands of the sea, among the Franks and the Arabs, the Scandinavians, the Patagonians, and the Polynesians, there were none who could give themselves airs over this. The descendants of Adam, the world over, could show nothing better." This expresses a feeling that the stranger in England feels it no disgrace to confess to, and it makes the reflections of the returning sojourner almost to a certainty worth listening to. Mr. Nadal's volume is entertaining rather on this general ground than in virtue of any remarkable acuteness of its own. It is graceful and agreeable—it is what one would call a gentlemanly book; such a book as it is becoming for a gentleman who has been attached to a legation to write, if he is disposed to remain within the limits of decidedly light literature. It is in excellent taste, and wholly free from indiscreet allusions and betrayals. The author has had an eye to style, and, indeed, like most of the young American writers of our day, he is rather inclined to be finical—to be too susceptible to the charm of words. Mr. Nadal's observations, however, rather lack incisiveness, and strike us occasionally as vague and ineffectual. They are too often not put into a form to which the reader can say positively yes or no; he is left wondering what the author would be at. We get an impression of an unsuccessful attempt at subtlety—as, for instance, when Mr. Nadal speaks of the men at the clubs: "The few men who are literary and intellectual make perhaps the weakest impression. The thin wash of opinion which forms their conversation evaporates, and leaves a very slight sediment. They have that contagious weariness I have noticed in the agricultural population along the water-courses of Illinois and Missouri." And he proceeds to develop the analogy between the clever young Englishmen and these dismal products "of fever and ague and the long eating of half-baked bread." The reader, however, has some trouble in perceiving it, and suspects that Mr. Nadal sometimes pays himself, as the French say, with mere conceits.

It must not be inferred from the words just quoted that Mr. Nadal's criticism is generally of a hostile kind. It is, on the contrary, very friendly and sympathetic, and the author has the faculty of frank yet not intemperate admiration. For the women and young girls he has nothing but good words. "That 'young English girl' who is the theme of the novelists and magazine bards and artists, easily merits all the admiration she receives. Does not all the world know, is it not an impertinence to say, that for dignity, modesty, propriety, sense, and a certain soft self-possession, she has hardly her equal anywhere?" Mr. Nadal's appreciative spirit does justice even to the preoccupied dowagers at the parties. "Some large and listless mother whose eyes are following her charges over the field, and who has asked you for the fourth time the question you have already answered for the third—to go on discoursing to such a person as calmly and fluently as Cato does to the universe, is a great and difficult thing. There is not a pleasure in it, nor indeed a rapture, but there is real growth and building-up in a certain amount of it." This is excellent, and Mr. Nadal touches many other points no less happily, and, it may be added, in the same inconsequent order in which one encounters them in English life. One is struck, however, in reading his remarks with the essential difficulty of making sound final generalizations upon foreign manners and customs. There is never an example of a tendency which cannot be matched with an example of a directly opposite one; and who shall say which is the more characteristic? The gentleman who, on Mr. Nadal's endeavoring to sound him as to the extent to which Englishmen were bullied, in behavior, by public opinion, answered briefly, "Oh, I don't know; we do about as we please"—this typical Briton, whether or no he affirmed a truth, at least administered a not unwholesome snub to the analytic spirit. The English, we think, are especially impatient of this kind of social and psychological analysis; they have little natural genius for it; and the more delicate it pretends to be, the more they feel the instinct to shake themselves free of it. We suspect that the most valuable book that could be written upon "London social life" would be a mere collection of anecdotes—of facts from the writer's observation—arranged under heads, but not made to support conclusions. Of things said to him, samples of conversation overheard, incidents observed, and so on, a discriminating observer might present a very curious array. Mr. Nadal errs in giving too few examples and too many generalizations. He comments very justly upon the fixed limits in which talk generally moves in England—the way in which a certain pitch is taken, so that it produces a discord to sound a note outside of it. "Certain things are set apart as good for men to converse upon—the races, horse-flesh, politics, anything, in short, provided it is not discussed in a definite or original manner. No man should say anything which might not be very well said by any one else." Every American who has been in England knows the meaning of this, and yet he is puzzled to reconcile it with the equally incontrovertible truth that in the London world there is an unlimited amount of original opinion propounded, and that radicalism of thought may be observed at London dinner-parties to be in a far more mature and highly organized condition than is suggested by its usual presentation here. It is a seeming inconsistency that Mr. Nadal should go on to say that "the freedom and gaiety which are not uncommon in the parlors of Americans of the best class will be hard to find in the drawing-rooms of English fashionables. They *talk*, professedly." Does Mr. Nadal mean that the "fashionables" *converse*, according to our American term? We rather imagined that we possessed the monopoly of this accomplishment (though, indeed, it is perhaps not most common in the somewhat mysterious class to which Mr. Nadal alludes), and that from this particular reproach the English were conspicuously free. Their small-talk is certainly more amorphous than that of other nations, and we suspect that, by the same law, conversation of the better sort is less declamatory. Here and there (sometimes in very minor matters) Mr. Nadal is a trifle fallacious—as, for example, when he says that "the genteel English think it common and snobbish to dress much on Sunday." His adjective sets us rather adrift; but if we are right in supposing that he uses the word "genteel" without irony, we should say that on this momentous point his memory had betrayed him. Certainly, the aspect of English society at eleven o'clock on a Sunday morning is a lively testimony to the idea of wearing one's "best." We appeal to the memory of any one who has assisted at an English Sunday breakfast, and has seen the ladies gracing this meal in the evening-dresses of the night before.

About the innumerable picturesque aspects of England Mr. Nadal says some very charming things, and in this matter he seems to us at his best. He says, indeed, that, if the man of society be unselfish, and be careful to retain his sanity, "its chief good [that of London society] is in what it offers him to look at—the carriages flashing back and forth at the dinner-hour, looking like caskets or Christmas-boxes, with the most wonderful lining and furniture (the drapery and lace almost floating out of the windows), the balls and parties, the acres of fair-armed British maidens through which he may wander as in a wilderness, the odors of the midnight gardens, the breath of the dawn, and the first flush of sunrise over Hyde Park as the drowsy cabman wheels him home to bed." Mr. Nadal feels the English background sensitively, and is able to say with evident sincerity that "the 'decent church' (inimitable adjective!), when, for the first time, on the road from Liverpool to London, one sees it crowning a well-clipped, humid hill-top, softly returns to the imagination as something known in

* 'Impressions of London Social Life. With other Papers suggested by an English Residence. By E. S. Nadal.' New York: Scribner, Armstrong & Co.

infancy and forgotten." In speaking of the general appeal which the Church of England makes to the imagination, he says felicitously that "with us it is always the particular church, say, at the corner of Moyamensing Avenue and Eighteenth Street, which attracts or repels one. Is it a good place to go to? Do we like the clergyman and do we like the people?" The author makes a good point, in his admiration of English scenery, in lamenting the absence of rail-fences—on which to sit and enjoy the view. A rail-fence, as we understand it here, is not a beautiful object—and for no small part of its prettiness the English landscape is indebted to the absence of this feature—and yet remains always, most distinctly, a picture that one has to stand up to look at. When after a long and lovely English walk, he has felt disposed to linger awhile longer in the twilight, the American pilgrim has often found it an irritating reflection that he cannot sit upon a hedge. To sit upon a fence for æsthetic purposes is, we take it, not criminally vulgar. We may quote in conclusion a very graceful allusion to a suburban garden which the author used to frequent:

"I sat alone upon a broken, dirty, iron bench—(I beg the T——'s pardon for calling their bench dirty)—and under an old pear-tree. It was a long narrow patch of sod and flowers. The brick walls were rent and decayed, and, except where the peach and vine covered them, were green with moss and black with age. The neighboring gardens I only knew by the tops of the pear and May-trees. No sound came from them save the rustle of their greenery, which now and then disturbed the heart of the quiet hour. Of the children who played in them, of the maidens who knelt among their flowers, I knew nothing. The same sunshine and yellow haze filled them all, the same Sabbath silence. From out their narrow plots all looked upward to the same blue sky. I used to think that the gardens never ended, but lay side by side the island through, and that the sea washed them round."

That last is quite exquisite, and exactly hits the fancy that the charmed American is apt to have in England concerning almost any green place in which he may find himself.

## GERMAN PESSIMISM*

THE German intellect is a far more complex affair than the English intellect, and *à fortiori* than the French or Italian. From sensualism to mysticism, from fatalistic quietism to the most ruthless practicality, there is hardly a mental quality or tendency which one will not find better represented in Germany than elsewhere; save only one, and that is the quality of *naïveté* or spontaneity. Every subject of King William is, *ex-officio*, reflective and self-conscious, unable to surrender himself to any sentiment, however simple, till he has reflected on it and woven it into a systematic theory, or in other words transmuted it from an impulse into a principle. Whatever the German feels or does, he does with malice prepense; he *justifies* himself, by showing that the act or thought must rightfully flow from one in his position. Whether the position be that of a citizen properly filled with *Nationalbewusstsein*, of a competitor in the egoistic struggle for existence, of a subject of the Categorical Imperative, or of a *Moment* in the *Weltprozess*, is all one—we find everywhere that same cold-blooded self-corroboration and merging of the personal deed in universal considerations which, more than material spoliation and Draconian discipline, exasperated the French during the late invasion, and have made them call the Germans "hypocrites" ever since.

Perhaps as striking an illustration of this overweening tendency to theorize as can be found is afforded by the popular German school of pessimistic philosophy, of which Professor Pfleiderer's pamphlet is the latest and one of the ablest criticisms. In other countries, aristocratic misanthropes, dyspeptic pleasure-seekers, and unappreciated geniuses have existed, and their utterances never passed beyond the sphere of splenetic or pathetic individuality. Souls with an unassuageable love of justice and harmony have also existed, and their utterances, like Leopardi's and Shelley's, have been lyrical cries of defiance or despair, which perished with them. It was reserved for Schopenhauer to show his countrymen that the cursing and melting moods could be kept alive permanently, and extended indefinitely by making proper theoretic deliberation; and Schopenhauer's disciple Hartmann, whose work, the 'Philosophie des Unbewussten,' has met with one of the greatest literary successes of the time, and carried the new gospel into regions where the torch of metaphysics had never yet begun to glimmer, has made everything so simple and perfect in his system, that all who have a quarrel with destiny, whether peevish or tragic, can be housed there side by side, without altering their mode of life or losing any of their "home comforts" in the process of cure. For it would be unpardonable in these philosophers to preach disgust with life unless the disgust were likely to lead the way to a cure. Existence being of course the original sin of that substance or essence of things which Schopenhauer calls "Will," and to which Von Hartmann gives the name of "the Unconscious," annihilation or *nirvana* is of course the cure. And in both philosophies this may be attained through the thorough and final intellectual persuasion of the vanity of all the goods of life and the consequent extinction of every desire.

But here begins the divergence. The aristocratic master has no hopes of the human or any other race as a whole, and his *nirvana* is restricted to the few who are ascetics and saints. In the witty words of Pfleiderer, the battle-cry with which he plunges into life's fray and rallies his followers about him, is the well-known "sauve qui peut." The pupil, on the contrary, equipped with a Berlin education and imbued with notions of evolution and progress which to Schopenhauer (who wrote before Darwin) were profoundly distasteful, provides for a collective salvation, based on no less a performance than a unanimous resolve on the part of all sentient beings, penetrated at last through and through with *tedium vitae*, and despair of gaining anything by fighting it out on the line of existence—*to stop*, and back out of it, when *this* world will cease at any rate. Whether there will ever be another world depends wholly on whether the wicked old "Unconscious" chooses again to emerge from its state of mere potentiality; and as it is a being without rhyme or reason, a mere *brutum*, the chances for and against that unlucky eventuality are just even, or expressed in mathematical language by the fraction ½. Schopenhauer's philosophy, says Hartmann, is one of despair. So far is this from being the worst of all possible worlds, that it is the best, for it tends invincibly to the *summum bonum* of extinction. Let no man then desert the ranks, but each labor in the Lord's vineyard, sneering, lamenting, and cursing as he pleases, getting indigestions himself, and begetting young, to inoculate them with a disgust greater than his own, and co-operating so with the grand movement of things which is bound to culminate in deliverance. Above all, let us have no standing aloof and trying prematurely to save one's individual self, like Schopenhauer's ascetics This delightfully unselfish submission to epicurean practice in the midst of pessimistic theory is Hartmann's cleverest stroke. As in Béranger's song:

> "Nous laisserions finir le monde
> Si nos femmes le voulaient bien!"

Schopenhauer was truly a bungler. But, joking apart, the reader can easily see how little living seriousness Hartmann possesses. He seems to us to have a clever journalistic mind, with a Prussian education, ready for any paradox which will make a sensation, and without a grain of that *auctoritas* which belongs to the sombre and impressive genius of his teacher.

The latter is assuredly one of the greatest of writers. When such a one expatiates upon the texts of *Homo homini lupus* and Woman the focus of the world's illusion, he will have all the cynics with a taste for good literature for his admirers. And when he preaches compassion to be the one cardinal virtue, and morbidly reiterates the mystic Sanskrit motto, *Tat twam asi*—This [maniac or cripple] art thou—as the truth of truths, he will of course exert a spell over persons in the unwholesome sentimental moulting-time of youth. But the thing which to our Anglo-Saxon mind seems so outlandish is that crowds of dapper fellows, revelling in animal spirits and conscious strength, should enroll themselves in cold blood as his permanent apostles, and feel as sorely when their pessimism is attacked as the fabled old dead inmate of the almshouse did when, not good enough for heaven, she was also shut out from hell, and sat on the road and wept that she should have to return to Tewkesbury.

For, however it may stand with Tewkesbury, in the world at large, practically considered, optimism is just as true as pessimism. These Germans can attain their absolute luxury of woe only by speaking of things transcendentally and metaphysically. As far as the outward animal life goes, the existence of a Walt Whitman confounds Schopenhauer quite as thoroughly as the existence of a Leopardi refutes Dr. Pangloss; and Hartmann's elaborate indictment of the details of life is precisely on a par in point of logic with the "wisdom and beneficence" philosophy of the most edifying and gelatinous Sunday-school orator. Common-sense contents itself with the unreconciled contradiction, laughs when it can, and weeps when it must, and makes, in short, a practical compromise, without trying a theoretical solution. This attitude is of course respectable. But if one must needs have an ultimate theoretical solution, nothing is more certain than this, that no one need assent to that of pessimism unless he freely prefer to do so. Concerning the metaphysical world, or the ultimate meaning of things, there is no outward evidence—nothing but conceptions of the possible. Distinct among these is that of a moral order whose life *may* be fed by the contradictions of good and evil that occur in the external phenomenal order. Those empiricists who are celebrating

* 'Der moderne Pessimismus. Von Dr. Edmund Pfleiderer.' Berlin: Carl Habel; New York: L. W. Schmidt. 1875.

nowadays with such delight the novel mathematical notion of a fourth or "transcendental" dimension in space, should be the last persons to dogmatize against the possibility of a deeper dimension in *being* than the flat surface-pattern which is offered by its pleasures and pains, taken merely as such. Now, if such an order in the world is possibly true, and if, supposing it to be true, it may afford the basis for an ultimate optimism (quite distinct from mere nerveless sentimentalism), there is no reason which should deter a person bent on having some commanding theory of life from adopting it as his hypothesis or working faith. He may of course prefer pessimism, but only at the price of a certain internal inconsistency. (We purposely neglect to consider dogmatic materialism here.) For pessimism is really only consistent with a strictly dogmatic attitude. It is fatalistic in the thorough Oriental sense, being by its very definition a theory from which one is bound to escape, *if he can*. Its account of things is confessedly abhorrent, and nothing but coercive outward evidence should make one stay within its pale. Now, a hypothetical door like that offered by the notion of a ransoming moral order "behind the veil" is better than no loophole of escape; and to refuse to give one's self the benefit of its presence argues either a perfectly morbid appetite for dogmatic forms of thought, or an astounding lack of genuine sense for the tragic, which sense undoubtedly varies, like every other, from man to man.

With transcendental optimism, on the other hand, it is just the reverse. If it is *true*, why, then, there is the deepest internal congruity in its *not* being mechanically forced on our belief. As a fatalistic *nolens-volens* creed, it would be devoid of all moral character. Or rather, we may not talk of its *being* true, but *becoming* true. Its full verification must be contingent on our complicity, both theoretical and practical. All that it asserts is that the facts of the world are a fit basis for the *summum bonum, if we* do our share and react upon them as it is meant we should (with fortitude, for example, and undismayed hope). The world is thus absolutely good only in a potential or hypothetic sense, and the hypothetic form of the optimistic belief is the very signature of its consistency, and first condition of its probability. At the final integration of things, the world's goodness will be an accomplished fact and self-evident, but, till then, faith is the only legitimate attitude of mind it can claim from us.

So plain is all this that the pessimistic controversy has far more of an ethnic than a philosophic interest for us. We are only sorry that, at this distance, the data are too few for us to see what its full ethnic import is. If it simply result in confirming in Germany the tonic creed that there comes a time when every good, however precious, is fit for nothing but destruction, for the sake of a higher good, and that passive felicity is a dream, it can do no harm. Dr. Pfleiderer's pamphlet, which takes substantially the same ground as we do, is both temperate and witty, and may be cordially recommended to those interested in the subject.

---

*Shakespeare Diversions.* A Medley of Motley Wear. By Francis Jacox. (New York: Scribner, Welford & Armstrong. 1875.)—The author of 'Shakespeare Diversions' has a bit of pleasantry in his title, for it means that the reader is to be diverted *from* Shakspere as well as with him. He begins with some phrase of Shakspere, and thence diverts and diverges and divaricates. Many of his sections are in fact collections of elegant extracts classified under commonplaces—"Time the destroyer," "Time the vindicator," "To be and to seem," "Let well alone," "Sympathy learned in suffering," and the like. This, for example, is the heading of a section:

"Sweet Rose, untimely plucked:

"'Whom the gods love die young,' a disputed adage—Short-lived Virtue, long-lived Vice—Readings from Wordsworth, Dryden, Sainte-Beuve, Burns, Wesley, Byron, George Eliot, Southey, Caroline Bowles, Victor Hugo, Gibbon, O. Wendell Holmes, C. Reade, Ant. Trollope, Procter, Malherbe, Lytton."

The range of our author is not very wide for our encyclopædic age. Most of the matter is from the best of the wholesome poetry, novels, and essays of the day, or from those English and French classics which no gentleman's library should be without: Beaumont and Fletcher, Ben Jonson, Pepys, Gibbon, Joanna Baillie, Crabbe, and Walter Scott, with Corneille, Racine, Molière, Châteaubriand, and Boileau—the true old English gentleman's reading. There is little or no English before Shakspere; Chaucer is used only once or twice. There is little German; Goethe is used four or five times, and Schiller oftener. A good many Americans are cited. Hawthorne is a favorite, and Holmes; then Emerson, Lowell, Irving, Cooper, Prescott, Motley, Longfellow, Margaret Fuller, Poe, Mrs. Whitney, Artemus Ward, President Lincoln, and Colonel Mosby. These are as interesting, if not as imposing, as the same number of Sanskrit, Persian, and Chinese authors would have been. On the whole, we like the book; the tone is healthful and pleasant—that of a cultured gentleman with no hobbies and no nonsense; the material is pure, the language good book-English. The subjects are interesting. Besides the rather commonplace topics which we have referred to, there are historical studies and sensible Shakspere criticism, and now and then linguistic chat like that on *Hotspur* or on the difference between *vocation* and *avocation*. The effect of the book is quite different from that of a mere collection of elegant extracts; for the citations are introduced or accompanied with explanatory and critical remark which lets us into their meaning, and connects them with the topic they are brought to illustrate, so that they are woven into an essay, which flows or trips along without breaks or jars, like the talk of a full man in his own library to a receptive friend on a leisure day. Such a day with Sainte-Beuve or Emerson or Lowell has a flavor for the imagination like a night with Socrates. This is not that, but it has suggested it, and is a pleasant book.

---

*The Child.* By Monseigneur Dupanloup, Bishop of Orleans. Translated, with the author's permission, by Kate Anderson. (Boston: Patrick Donahoe. 1875. 12mo, pp. 294.)—Bishop Dupanloup begins his preface with these words: "Having, after long study and laborious experience, sought, by the most profound reflection, to discover what the two fundamental rules in education were, I have found them to be authority and respect"—respect, that is, for the pupil on the part of the teacher. Certainly, if these are not intrinsically the most fundamental rules in education, they are those most commonly neglected at the present day, and their principles are developed in this little book with great earnestness and eloquence. The treatise is, of course, addressed to Catholic parents, and the Catholic faith is assumed on every page. To such parents it may be unhesitatingly recommended, and most Protestant parents would not be the worse for having their attention called to this side of education, however different may be their point of view in the education of their children. The "triple concupiscence"—the three sources of "all the evils of human nature"—are, in the view of the bishop, pride, sensuality, and levity, and his discussion of these is excellent. But compare this with Sir Walter Scott's theory of education, who desired that his grandson should, like the ancient Persians, learn "to ride, to draw the bow, and to speak the truth," believing that manliness and truthfulness will carry all other virtues with them. It is significant that Bishop Dupanloup hardly mentions truthfulness. It is noticeable, too, that he speaks of the dangers of society and of the [French] public schools in precisely the terms that the Catholics use in this country.

---

*The Mirror of a Mind:* A Poem. By Algernon Sydney Logan. (New York: G. P. Putnam's Sons. 1875).—In the evil days on which we have fallen, to recommend a book, especially if it be poetry, for its simplicity is no faint praise. This is not the highest merit of Mr. Logan's verses, but it is the first which strikes a brain and ear wearied with the jar and jangle of modern minstrelsy. The simplicity is genuine; it is not quaint; it is not pastoral; it has no mannerism at all; the thought is distinct and natural, and so is the expression, except now and then where a 'prentice hand becomes slightly entangled in the difficulties of prosody. These have been increased by the choice of a metre which gives no respite, the volume consisting of a series of fragments in Spenserian stanza; yet it is managed with skill, and the verse is generally smooth and harmonious. Mr. Logan's muse has an old-fashioned quality of youthfulness truly refreshing after the precocious decay with which so much recent poetry is rank. The "mirror" reflects the phases of a mind too deeply imbued with sadness, but as free from the violence, cynicism, and paradox of which we have had so much, as the phrase is free from exaggeration and obscurity.

# The Nation.

*NEW YORK, THURSDAY, OCTOBER 14, 1875.*

## The Week.

OHIO has been carried against the inflationists. As we go to press this is all that can be positively stated; but the returns indicate a fair majority for the Republican ticket. The result is cause for profound rejoicing. The train of evils that might and certainly would have followed a triumph of the rag-money party could not be contemplated without the gravest anxiety, especially by those who, being on the spot, knew something of the inner counsels of that party, and of what reckless and unscrupulous material it was composed. While the campaign wore the appearance of a great argumentative struggle, the debate had but one side in which there was any show of a reasonable regard for facts, without which there is no such thing as argument. We doubtless owe the victory to the real power of public discussion of the currency question by a few honest and well-informed speakers, and to Mr. Schurz more than to any one else. It is not the first time, as Senators Morton and Sherman know, that repudiation and inflation have been fairly beaten by such discussion, but we must not deceive ourselves that it has now been done once for all. The closeness of the vote in Ohio, and the fact that the German voters alone probably prevented the defeat of the hard-money party, tell a very plain tale as to the condition of the popular mind, not only in Ohio but elsewhere. The schoolmaster is abroad; by no means let him yet be recalled.

The currency discussion has been marked during the week by an incident which is both serious and comic, but more comic than serious. Mr. Wendell Phillips wrote a letter to the "Legal-Tender Club" a week or two ago, marked by the now usual folly, inaccuracy, and ignorance of his utterances. We do not believe there is another civilized country in which it would have attracted any public notice from anybody who had any work to do. Here, however, he has been solemnly refuted in the leading newspapers, and by Mr. Hugh McCulloch, Mr. Schurz, and finally even by Mr. Charles Bradlaugh, the English agitator. Mr. Schurz was evidently ashamed of his task, but excused himself by alleging the pressure put on him by friends, who feared the effect of Mr. Phillips's nonsense on the ignorant and unthinking. There is probably something in this plea, but then it has to be taken into account that Mr. Phillips cannot be silenced, for his trade, in so far as he has one, is to talk, and he cannot be overthrown in argument, because he does not argue. He has never had much reasoning power, and now has almost none. He is probably more unscrupulous than he ever was, more reckless in his use of what he calls authorities and in misquotation, and at the same time fully as fluent and abusive as he has ever been. He does not understand any system or theory of currency, not even Law's, has little or no acquaintance with financial history, and apparently only reads books to pick out detached sentences, in order to give sham points or glitter to his paradoxes. Doubtless, he has influence with shoemakers and the rest of the sedentary portion of the working-classes, whose nervous system is depressed and made morbid by want of exercise; but even this he owes in no small degree to the extent to which all classes have of late years aided in dissociating rhetoric from morals, knowledge, and even common-sense. We allow a man to make a handsome living by it, on the simple condition that he shall be "brilliant" and "spicy," and encourage him to believe that there is something finer in talking nonsense on the platform than talking it at the fireside. Mr. Phillips, for instance, attended a meeting of Boston merchants not long ago, called to consider the best mode of improving transportation from that city to the West. Everybody present was of course aware that he knew no more about transportation than any store-girl in Boston. Nevertheless, he was requested "to make a few remarks," and he arose and delivered a discourse of the utmost absurdity to this assemblage of mature business men, on their own subject, in which he made the truly kindergarten suggestion, that if they wanted easy and cheap communication with the West they should buy a railroad. In view of incidents of this kind, is it anything wonderful if what the Springfield *Republican* calls "the illiterate workingman" thinks him an authority on currency? He has replied to Mr. Schurz in a letter of which it need only be said that it is less insolent and abusive than the first one.

The election in Massachusetts promises to be a curious one. The Republicans are confident of being able to elect Mr. Rice, and point with great satisfaction to the reorganization of the State Central Committee. For some years now this committee, which procures funds and kindles enthusiasm for the campaign, has been composed of small local politicians, nominated by delegates in a loose sort of way at the annual convention. This year, however, eleven members-at-large have been added, from whose exertions and wealth a great deal is expected. As the Republican newspapers say, the issue in Massachusetts is not a paltry personal issue between Rice and Gaston, but the question to be decided at the polls is whether Republican ideas, principles, aims, and motives are to triumph, or those of the party which opposed the war, opposed Lincoln, opposed the abolition of slavery, and are now obliged to give "pledges" that they will not re-enslave the African and demand the payment of the Confederate debt. The "record" of the Democrats is certainly not very good, but whether the average voter can be properly frightened by it is still to be seen. Meanwhile, the Prohibitionists have held a convention and nominated an independent ticket, as well as the Labor Reformers, while the Woman-Suffragists are to be allowed to vote for any one they please. The "arithmetic men" will probably derive more profit from the problem than any other class.

The news from the South continues to be economically satisfactory. Everything points now to a cotton crop of some four and a half million bales, the largest ever raised; and when we reflect upon the annoying circumstances which have surrounded its planting and cultivation, we cannot but feel that the croakers and cynics who are always predicting evil to our country know little about her resources or capabilities. At the North we are accustomed to interruptions of industrial or agricultural operations from strikes, lockouts, and other difficulties between employers and employed, but we can probably form from these but a slight estimate of the embarrassment attending the production of a large cotton crop while the wholesale slaughter of the laboring population by their employers is going on. In Alabama, Mississippi, Louisiana, Georgia, and most of the other cotton States, the brutal and ignorant whites have been chiefly occupied during the most critical periods of the past cotton year in hunting down and massacring the faithful blacks. Congressional committees have found the soil of the South strewn with corpses, and the United States was forced to do something to save the crop by reorganizing the legislature of Louisiana. Slaughtered as he has been, however, the faithful negro has dragged himself back to the cotton-field, and hoed and planted and picked without a murmur. There are few more touching instances than this on record of the force of habit and attachment to the occupations of the past. As an economical feat the production of the crop of this year is probably unsurpassed, and it is curious to notice how strikingly the present condition of the South has been depicted in the lines of the New England poet (which have been thought so unintelligible) exposing the absurdity of the "red slayer" who "thinks he slays," and the slain if he "think he be slain."

Few problems in sociology or politics have of late years received so much earnest thought and attention from our branch of the

Anglo-Saxon race as that relating to the proper treatment of the Indians. Almost every plan has been tried at one time or another, but though by means of extermination, investigation, corruption, fire-water, missionary work, and colonization some headway has been made, the solution has not been quite reached. Even General Grant, who during the past seven years has devoted a large part of his time and attention to the subject, is not perfectly satisfied with the progress that has been made. The Indian investigating commissioners, however, are now engaged in writing their report, and it is confidently expected that the problem will be finally solved in about a week. Meanwhile, we must call attention to one peculiar feature of the present condition of Indian reform, and that is the fatal effect which the efficient discharge of the duties of any office connected with Indian administration has on a man's official career. It appears from the correspondence between General Grant and Mr. Delano that the latter was retained at the head of the Interior Department, on account of his great skill and fidelity, for six months against his own desire, because of the utter impossibility of getting any one half so good to fill the place. Mr. Saville the investigations of the commission have entirely exonerated from all the charges of fraud brought against him by Professor Marsh, and yet he is going too; and Mr. Smith, whom we know (from letters that we have received about him) to be a staunch friend of the Indian, and one of the purest men now living, is going too. What is to become of the poor Indian if his friends desert him in this way we hardly know, but there are evidently some dark points about the Indian problem still.

---

The examination of Cheever, the lobby-agent who claims a quarter of the profits of Clews's Government financial agency, before the Registrar in Bankruptcy on Wednesday week, produced more discreditable revelations. It appears that Cheever lobbied for Clews for two years, "conferring" on the subject with nearly all the leading Republican Senators, showing that Clews, as "a wise, energetic, and trustworthy man," and as "a liberal friend of the Administration," ought to have the agency, explaining "the weakness of the other houses," and "calling attention to some errors of the Barings," and maintaining that it would not be proper to give it to Morton, Rose & Co., as "one of their partners, Sir John Rose, was a titled gentleman in England." He then, being further questioned, revealed the fact that Judge Dent, General Grant's brother-in-law, was to have one-eighth of the profits, the consideration being "his services as counsel in the matter," and "afterwards he was to act as counsel for the agency in Washington," and the worthy Clews "offered him $25,000 to come here to New York as counsel," but he (Cheever) did not know what services Dent had ever rendered. A letter of Cheever's was also put in, pressing for payment on the ground "that he had partners to share with him." It is worth notice that the James Van Buren whose name appears in the contract as one of Clews's partners is not known to Cheever or to anybody else, and cannot be found, and there is no doubt that the name is a fictitious one, intended to cover the interest of somebody who has good reason for keeping out of sight.

---

We do not know what the powers of Registrars in Bankruptcy in the matter of summoning witnesses are, but we do know that no investigation of this transaction will be complete in which Mr. George S. Boutwell is not examined. The New York *Herald* has published extracts from the diary of a person evidently well informed, recording interviews with both Messrs. Seward and Boutwell in 1871, showing that the former highly disapproved of the change, and testified strongly to the manner in which the Barings had sustained the Government "during the darkest days of the war," and that Boutwell had assured them that there was no cause of complaint against them, but that it was felt necessary to give the business to two American houses recently established in London, "on account of their loyalty." Mr. Seward further said that the Barings had cashed drafts on the Government of Schuyler, Hartley & Graham, for $4,000,000, in 1862, when an account of $50,000 with the State Department, to which a correspondent refers in another column, was lying unpaid; and he informed Mr. Washburne during his visit to Paris that he had withdrawn his *exequatur* from Mr. Habicht, Clews's partner, when Swedish Consul in New York, for blockade-running during the war. The diary further relates that when the first bills from the Asiatic squadron drawn after the change arrived in London, and were accepted by Jay Cooke, McCulloch & Co., they were vainly offered for sale to the Bank of England and other banks, and were finally taken by the firm itself at nine per cent. discount; the bills of the Barings at the same time selling at three and a half per cent. It also adds that Mr. Boutwell likewise spoke in high terms of the Barings, and said "that he was not responsible for the change." Thus far, the indications are that the Simple-Minded, Sagacious Man at the White House, whom all the Republican conventions are eulogizing, had more or less to do with bringing it about.

---

The Supreme Court at Washington has given a woman-suffrage decision which will set at rest all doubts as to the effect of the Fourteenth Amendment on woman's "right" to the ballot. The question presented by the case was, whether the plaintiff, a woman and a citizen of the United States and the State of Missouri, has the right to vote in that State, the constitution and laws of Missouri to the contrary notwithstanding. The argument on her side was that women, being made by the amendment "citizens of the United States and of the State wherein they reside," have the right of suffrage as one of the "privileges and immunities" of their citizenship which cannot be abridged by the State. There is no doubt, the Court says, that women may be citizens, but the Amendment did not add suffrage to the privileges and immunities of citizens as they existed at the time of its adoption, and suffrage has at no time been one of the necessary incidents of citizenship. The opinion, delivered by the Chief-Justice, is of course conclusive, and what will probably strike most lawyers about it, is wonder that the point should ever have been raised. Every one in the country knows that the Fourteenth Amendment was not adopted for the purpose of giving women the right to vote, and the argument made to support the claim is only a shade less puerile than that which is made by some women's-rights agitators from the Fifteenth Amendment abolishing "slavery and involuntary servitude." Considering the crowded condition of the Supreme Court docket, and the vast number of really important cases which are delayed by such suits as this, it seems as if a more peremptory way of dealing with them would be better, and as if giving up precious time to the consideration of such arguments as we have just referred to might possibly lay the Court open to the charge of a "delay of justice" provided against by a much older bill of rights than the Fourteenth or Fifteenth Amendment.

---

Mayor Wickham has addressed a letter to all the Police Commissioners, recounting charges which have been made against them, and asking them to show cause why they should not be removed. There has been a sad dearth of news lately; and we cannot wonder at the excitement and interest manifested by the reporters, who have been watching for something of the kind since the attack made by General Smith on the Commission, when it came out that on Friday, shortly before noon, and just before the meeting of the board, the Mayor's messenger had "delivered a large envelope" to Messrs. Voorhis and Disbecker, and that it was believed that Mr. Matsell had received a similar one. The color of the envelopes was not mentioned, but it is admitted by the Commissioners that they were marked "personal." Matsell declares that after forty years' faithful service of the city he will never resign without a full investigation of the charges against him. The reorganization of the Board, and the character of the new appointees, will be a pretty good test of the virtue of Tammany, as the manipulation of the election returns will be in their hands. New York "politics" has received a new illustration during the week from the publication of a correspondence between Recorder Hackett and one of the

Tammany secretaries. The Recorder is one of the few judges in the city who is a terror to evil-doers, and has succeeded to a certain extent in remedying the laxity of the laws by the severity of his sentences, and has, we believe, kept his court quite clear from politics. Last year, however, he received a notification that Tammany would supply him with his subordinates in future. To this he replied by a peremptory refusal, and having been dropped from the Tammany ticket he has been taken up by the Republicans. The other important news in this city is a decision of the Supreme Court putting a stop to all dilatory proceedings in the six-million Tweed suit, and directing him to answer within a week. He has also been sued in another suit, in which bail has been fixed at a million, so that he probably now "represents" in one way and another a larger amount of capital than any statesman of the day. We learn from a published interview with one of his counsel that they are greatly pleased with the order requiring him to answer, and say that their answer will be in substance a general denial of "the whole story."

---

The price of gold declined during the week 1⅝ per cent., partly because of the operations of the Syndicate and partly from speculative causes; moreover, gold began to arrive from Europe, $761,560 having come from London, and the equivalent of about $2,000,000 more having during the week been withdrawn from the Bank of England for shipment. The movement, too, as between this city and San Francisco has turned in favor of New York, and it is confidently estimated that at least $600,000 per week will be sent here from the San Francisco banks and bankers. Continued shipments from London are expected, as they entered into the calculations of the Bank of England directors when, last Thursday, they advanced the minimum discount-rate of the Bank to 2½ per cent. London, however, is losing gold not only to New York but to Holland, and particularly Germany; and there is reason for expecting that the Bank directors will find it necessary to advance their rate much further in the next sixty days. Foreign exchange continues feverish and fitful here, on account of the difficulties growing out of the small stock of gold in New York. These difficulties, however, have so far been removed that they must be classed as an embarrassment rather than an obstacle to the export trade. The money market is hardening, and lenders on call are generally getting 4 per cent. At noon on Saturday the value of $100 currency was $85 92.

---

The English question of the last week is a little "tiff" between the Queen and the public—the first, we believe, that has ever occurred—arising out of the sinking of the *Mistletoe* yacht by the royal steamer *Alberta* in the Solent, when three lives were lost. When the first coroner's jury, which afterwards disagreed, was sitting, the Queen wrote a letter to Prince Leiningen, the captain of the steamer, and whose conduct was therefore at that moment the subject of judicial investigation, expressing her great satisfaction with the way in which he and his subordinates had behaved at the time of the accident, and this letter he, by permission, read aloud and published. This was at the time considered an act of considerable indiscretion on Her Majesty's part, but it drew forth no comment. The jury came to no decision, though they simply differed as to the degree of blame which should be cast on the officers of the royal yacht. A second inquest was held on another body, and in this case a verdict was rendered directly censuring these officers for going at too high a rate of speed in a narrow and crowded channel, and for keeping an insufficient lookout. Indeed, it appeared clearly from their own defence that they went as fast as they could, and that they had no continuous lookout, and, as to the *Mistletoe*, took it for granted, not as rules of the sea require, that she would hold on her course, but that she would sheer off and make way for the steamer; and they insinuated that she had approached the steamer for the purpose of obtaining a view of the Queen, which the owner solemnly denied on oath, and for which in fact there appeared to be no foundation except the belief or knowledge of the Queen's officers that other yachts had done so on former occasions. The Queen then, after the verdict was rendered, caused a letter to be written to the president of the Cowes Yacht Club, expressing her desire that members of the club should be warned against approaching too near the royal yachts for the sake of getting a view of the Queen. As this implied that this practice not only existed, but had something to do with the loss of the *Mistletoe*, in spite of the evidence, and seemed a sort of defiance of the verdict of the jury, it has caused a great deal of public irritation, and has called out much discussion in the papers as to the proper limits of royal expressions of feeling and opinion on topics of the day. The relations of royalty to the state are now delicate, and rest so much on mere sentiment and mere understanding that slight things become important. A curious illustration of the courtier state of mind was afforded in the announcement in the *Court Journal* that "the Queen spoke to Miss Peel," whose sister had been lost, and who had herself been dragged half-drowned on board the royal yacht. To the outside world this seemed a simple act of humanity, but to the Ladies and Gentlemen in Waiting it doubtless was an event which would figure in history.

---

The Ministry in England have got into another scrape not unlike the Plimsoll affair. The Admiralty has issued a circular letter of instruction to the commanding officers of war-vessels cruising in the waters of slaveholding countries, with regard to the treatment of slaves which may take refuge on board. They are told that slaves must "not be misled into the belief that they will find their liberty by getting under the British flag"; that slaves must not be permanently received on board any description of ship under the British flag, except to save their lives, for otherwise the practical result would be, "in the first instance, to encourage and assist in a breach of the law of the country, and, next, to protect the person breaking that law." In foreign ports and harbors, too, a slave must not be allowed to remain on board after it has been proved that he is legally a slave; and if on the high seas a slave escapes on board a British ship, he must, when the latter returns within the territorial limits of the country to which the ship from which he has escaped belongs, be surrendered on demand being made. As all this is a complete reversal of the policy pursued by the English navy ever since Lord Mansfield's decision in the Somerset case, and is almost certainly opposed to the principles of law laid down by the English courts in a long course of decisions, the circular has excited the greatest indignation, and will undoubtedly have to be withdrawn. For instance, a slave getting on board an English ship on the high seas becomes or is free, *ipso facto*, by well-settled law. The Admiralty, therefore, can give the commanding officer no authority to surrender him subsequently as a slave.

---

The only new feature in the Herzegovina troubles is the appearance of a letter from the Sultan to the Grand Vizier announcing that there must be reforms in that province, commanding the tax-gatherers to stop extortion and cruelty, and the judges to stop taking bribes and rendering unjust decisions. The Servian Skupshina, or assembly, has, as already announced, left the question of peace or war in the hands of the Prince by a majority of 71 to 43; so there will certainly be no interference in that quarter, and it is just as certain that there will be none in any other. But it is said that though the Turkish Government has escaped this time, it is well aware that the present régime in its western provinces cannot be allowed to last. The attempts at reform made during the last thirty years have not produced much effect anywhere, but in Bosnia and Herzegovina less than elsewhere owing to the number and fierceness of the Mohammedan landlords, whose exactions are even more dreadful than those of the state. An effort will now be made with a large military force to introduce a better state of things, but with such a civil service as that of Turkey it is sure to fail. The prevalent impression in Vienna, Berlin, and St. Petersburg, as well as in Paris and London, is that the insurrection, futile as it has proved, has revealed clearly that the Turkish Empire is near its end. No one now pretends that it has any future.

## COMMERCIAL HONOR.

THERE is a widely-received and by no means unjustifiable opinion, either that a large number of the recent failures were unnecessary, or that a large number of those who failed might have paid, had they chosen, better dividends to their creditors. It is said—though of course it cannot be said with anything like certainty or accuracy—that it is no uncommon thing for persons who have been making a good deal of money for many years past, and have drawn out the profits of their firm and invested them on their own individual account, to throw up their business when they find it unprofitable, offer their creditors a composition made up of the few remaining assets of the partnership, and then retire and live handsomely, or begin anew on their private fortunes, which they treat as if they are not and ought not to be affected by their commercial liabilities. Whatever be the nature of the process, it is certain that bankruptcy has now few terrors for business men; that the name among us is not surrounded by the dismal concomitants with which the literature of the Old World has made us familiar; that to many of our traders it means not ruin but relief, not an increase but a diminution of care, and is not by any means attended with permanent loss of credit.

Some of those who are commenting on it are, however, making a mistake in supposing that this state of things is anything new, or is a special product of the present crisis, or argues any recent or serious deterioration of commercial morals. On the contrary, men's readiness to fail and the slightness of the reprobation with which failure is visited, have been a striking feature in American commercial history ever since the beginning of the century; and they took their rise not in any special depravity in our traders, but in the economic condition of the country. One of their most prominent causes has been the constant effort to substitute paper-money for gold and silver, which began in colonial times and has lasted down to our day, and which necessarily, owing to the number and variety of the schemes resorted to, gave business an aleatory character, and made unfortunate and inevitable failures so common as to render the distinction between them and voluntary or fraudulent failures very hard to make. Another has been the stimulus given to speculation by the settlement of the West, which began vigorously after the invention of steamboats, and diffused and often justified the most extravagant hopefulness with regard to the future, and made it very difficult to decide whether a bankrupt had been trading on rational or chimerical expectations. Another still has been that disinclination to cry over spilt milk which is so marked a feature in the national temperament, and is doubtless a necessary product of a long and successful struggle with the trials and difficulties of colonial life in a new country. An American is restrained from making a great fuss over his debtor's bankruptcy, and enquiring curiously into its causes, by much the same philosophy which forbids his sitting down in despair if his house is burnt down or if he loses his fortune. He regards the failure of those with whom he deals as one of the calamities of life which he is sorry for, but has no time to weep or swear over. The debtor may be dishonest, but he is unwilling to spend time investigating him. The more he has lost by him, the more precious his own time has become, so he lets him run, and thanks God he is rid of a knave. To make a great noise over him, and see whether a few dollars more cannot be extracted from him, he thinks imprudent as well as unmanly.

The moral duty of hunting down the fraudulent bankrupt sits lightly on him, too, partly because of the difficulty, which we have already mentioned, of drawing the line between honest anticipation and reckless or knavish speculation in a state of business which was at best highly speculative; and partly because of the strong disinclination to assume a position of moral as well as other superiority to one's neighbors which came in with the Jeffersonian Democracy. The hostility to all forms of social and political superiority could hardly last long without producing more or less hostility to all claims to moral superiority also. Men became as chary about saying or thinking that they were holier than their neighbors as about saying or thinking that they were more valuable socially or politically; and getting into a rage over one's neighbor's transgressions is necessarily an assumption of greater holiness. It is tantamount to saying that, under the same circumstances, you would not have done the same thing, which is something a good Democrat does not like to say. The work of moral reprobation and denunciation therefore became largely professional work. It was done in the pulpit, and as long as aimed at an abstraction called "the sinner" or "the corruptionist" was not resented, but anybody who attempted to direct it against A or B was apt to be accused of giving himself airs.

And then the sentiment of equality brings with it a strong sympathy with the trials of life, and a strong sense of one's own exposure to them, which make an American unwilling to sit in judgment on a man with whom life has not gone well, and who, whether by folly or fault, has failed in doing the thing he set out to do. The bankrupt, it is true, may be more of a knave than anything else, but popular feeling is, on the whole, readier to have many knaves prosper than to press hard on one honest man when in difficulties. So that, in one way or another, our bankrupts get on very well; and the more dishonest they are, the better for them, as creditors are almost invariably willing, and have been willing for a long time, to accept their statements as to what they can pay. The good old stories of the man who said "he *always* paid twenty-five cents on the dollar," and of the man who said his assets would produce that amount for his creditors and "that if they did not he would make it up out of his own pocket," are not by any means stories produced by the late panic or by the war or paper-money. They are at least fifty years old, and draw their humor from a state of morality which is older still. And yet it must not be inferred from the lightness with which bankruptcy is and has long been regarded among us that commercial dishonesty is more prevalent here than in Europe. On the comparative honesty of the two regions the statistics of failures or compositions with creditors would afford us little or no information, and, in fact, this is a matter which might well be used as an illustration of the way imperfect statistics may deceive. To ascertain the condition of morals in a trading community, we have not only to examine the lists of those who do not pay their debts, but to ascertain the extent to which credit is granted on mere character or parole assertions. There is no question whatever that it is thus granted here four or five times more freely than in England or on the European continent; that a young man starting in business here finds it four or five times easier to borrow capital than he would find it in London or Paris or Berlin; and a man of any age, who has broken down, ten times easier to obtain help and encouragement in beginning anew. The amount of business done—that is, of money and goods parted with—in American trade on mere impressions or on general confidence in human nature, would probably appall an English or German banker or wholesale dealer, even in the present reckless days. In fact, the very peculiarities of temperament, whether we call them virtues or defects, which make an American loath to deal hardly with a bankrupt, make him ready to give credit without much enquiry or on unsatisfactory evidence of good faith. The temptations, therefore, to which a man of easy virtue is exposed in this country are very great, far greater than those with which his European brother has to contend. In the first place, he gets funds with far less difficulty and on a shorter and more doubtful "record"; in the next, he knows in case he fails the penalty will not be serious. It will probably not strip him of all he has, or involve rigid enquiry into his mode of doing business, or injure his reputation among his friends. But even if it does, he has the habit of changing his abode, or is used to the spectacle of frequent migration, and has a vast continent before him where, without encountering "new skies" or "strange vegetation," and under the shelter of his own flag, he may try his fortune once more. Considering, in short, the conditions of trade among us, and the strange elements which enter into our population, the great variety in educational antecedents which mark it, and the numerous differences in its standards of morality, the wonder is that the American Bank-

rupt is as honest as he is. That he should so often pay twenty-five cents on the dollar, and should so frequently of late have shown a disposition to concede even thirty-three and one-third, we look upon indeed as a remarkable proof of his magnanimity and tender-heartedness. He *need* not pay over five cents, and could by a little firmness make ten cents seem liberal. Under these circumstances, there is to us something infinitely pathetic in the care with which he invariably leaves *some* assets for his creditors to sit on and appraise. There is something, too, very touching in the way in which the creditors turn them over and contemplate them, as if they really were all that a sternly virtuous and eminently prudent and heroic man could have saved out of the wreck of his enterprises, and in which they clap him on the back, after he has agreed to pay his dividend, and wish him success in his new ventures.

## THE MEETINGS AT THE HAGUE.

THE recent meetings at the Hague of the two associations for the consideration and reform of international law, do not seem to have been as productive of practical results as could have been wished. We say as could have been wished, for, in the case of a meeting of jurists, philanthropists, and reformers who expect by their deliberations to produce results in practical affairs, the suspicion and disfavor which failure brings with it tell with an unfortunate effect upon the reforms advocated by them, whether good or bad, and, by a natural reaction, upon reforms and reformers in general. The conferences at the Hague would perhaps have been more valuable had they been confined to the members of one body of reformers only; but, as there has been a double series, one held by the Institute of International Law, and the other by what is known as the Association for the Reform and Codification of International Law, the general difficulties of any agreement on the disputed points of the law of nations seem to have been gratuitously increased by the absence of any final authority capable of arriving at a settled decision, even of a theoretical character. The great difficulty with the reform of international law is the absence of what lawyers call a sanction, or, in other words, a penalty for the non-enforcement of its rules regularly enforced by some competent tribunal. As if to parody this defect, we find the Institute and the Association entering with full sovereign powers on the reformatory field, very much as two sovereign states do on the actual field: both with equal powers and rights, both founded at about the same time, both seeking to reform international law, both holding annual meetings in the same places about the same time, and neither possessing the final right to decide anything. It is all well enough as long as they agree, but if they differ, who is to decide between them? The Institute has adopted in the main the "three rules" of the Treaty of Washington. As to whether the Association agrees to this we are still left in doubt, which is not at all cleared away by the fact that the two governments which adopted them have never yet been able to agree upon their meaning, while two or three of the Continental powers are understood to be opposed to them, except on conditions which to maritime powers would be inadmissible. Again, the new war code brought forward by Russia (the object of which is to place Providence definitively on the side of the heaviest battalions, by outlawing, and placing beyond the pale of moral approval, all partisan levies and irregular troops which have the audacity to take arms for the defence of their country against a foreign invader armed and equipped in the orthodox manner) has been approved by the Institute but apparently rejected by the Association, while the English members of the Institute have protested against a resolution in favor of the general inviolability of merchant vessels in time of war, on the ground chiefly that on land an invading enemy has, in the right of "requisition," a means of plunder and oppression compared with which the right to capture merchant vessels is a mere bagatelle—and that this right of requisition is by recent practice firmly established, and will be very likely, in the next European war, to play a part hitherto undreamt of in deciding the contest. Of the two, the Association holds itself out as the practical working body, and yet, beyond the passage of a resolution "rejoicing in the fact" that so many national legislatures have "sanctioned the principle of arbitration," we cannot make out that the Association has accomplished anything.

It is not, however, for the purpose of discussing unsettled points in the law of nations that we now refer to the meetings at the Hague and their failure, but to call attention to the fallacy which usually underlies such attempts, and will always be apt to lead to such failures. The mistake which the philanthropists, jurists, and reformers who are now engaged upon this subject make is that they seem resolutely determined to close their eyes to what the law of nations really is. They always approach the subject as if it were a body of rules, generally admitted, recognized, and acted upon, but which, through the merest inadvertence, our ancestors had neglected to provide any means of enforcing. It is, however, no law at all, in the sense in which the word is familiar to us, because though it is, in the old-fashioned phraseology of Blackstone, a "rule of action prescribing what is right and prohibiting what is wrong," it is not a rule of action issued by any one as a command who has power at his back sufficient to enforce his commands. It has no legislatures, no statutes, no courts, no sheriffs, no *posse comitatus*. It is merely a body of opinion and custom which has grown up through the modern intercourse of nations, which has no sanction or penalty attached to its non-enforcement, except the public opinion of civilized mankind. The rules of international law which are laid down in Grotius or Wheaton have grown up with the gradual rise of modern states and the amelioration of morals and manners; and down to within a recent period no attempt whatever has been made to invent or prepare in caucus beforehand international rules, and then persuade nations to adopt them as being in themselves intrinsically good and "advanced." The gradual change from the barbarities of mediæval warfare to the humanity of the modern battle-field, with its hospital-tents and sanitary commissions and scientific surgery, has come from the general amelioration of manners and the general disappearance of cruelty and bloodthirstiness. The modern recognition of the right of expatriation has come from the modern custom of emigration induced by the general introduction of safety and ease in travelling and the opening of new countries to settlement, and to the same cause we may perhaps attribute the disappearance of the once hotly-contested "right of search," which, on abstract grounds, is as right—or as wrong—to-day as it ever was. The modern opposition to privateering, the disappearance of the right to poison wells and clothing, the humane treatment of prisoners, have all come from a general increase in the spirit of humanity, just as distinctly as the immense development of the rights of neutrals has come from the immense extension of modern commerce. In other words, the rules of international law, as they have arisen, have grown gradually out of a changed condition of facts and the application of an improved system of morality to those facts. The fundamental doctrine of international law—the equality of sovereign states—without which the science, as it is called, would have no existence, would yet be unknown to the profoundest thinker on such subjects, were it not that this equality began as an actual fact, and was merely recognized as a fact by those who first began to consider the rights and duties of nations.

International law is, indeed, nothing more than a public branch of morals, and the same general body of opinion is the only final authority in one as in the other. Now, in ethics it would be at once recognized as somewhat of an absurdity for a body of distinguished clergymen, leading fathers of families, and editors to get together and hold a convention for the study and reform of morals over the world. Yet there is really much greater reason why this should be done than that a number of jurists and philanthropists should undertake to amend and codify the law of nations. It would be beginning at the fountain-head of all reform, and would immediately and directly affect international law, without the necessity of Vattel's "falling on any one's toes." A convention in mediæval times

which should have discussed the question whether it was necessary to do unto others as we would be done by, and got the world to adopt their conclusions, would have made the custom of sacking cities in times of war an absolute impossibility; and a convention which should have formally adopted the love of one's neighbor as one's self as the basis of its operations, and secured its ratification in daily life by the leading mediæval governments, would have sent international law forging ahead, so that Wheaton would probably have been written early in the XVth century, and there would be, by this time, hardly any open questions left in the "science," except perhaps here and there such a one as, for instance, whether it is allowable to use deceit for the concealment of military operations, or whether it is fair to take advantage of superior force on the field of battle. No such attempt as this was ever made, because, in those modest days, it had not occurred to any one that, by putting the cart where the horse ought to be, the progress of civilization would be at all advanced.

To put the matter in another way—the persons upon whom international law is brought to bear are governments and their servants. Governments, and their ministers, and generals, and ambassadors, and consuls require to keep them in order very strong forces, inasmuch as they are very powerful themselves. Thus far only two things have been found sufficiently strong to affect them—war and, in modern times, public opinion. Now, it is the intention of the philosophers and professors who have taken the matter in hand to do away with the first and substitute for it arbitration, and of course, if this is to be done, the power of the only remaining substitute must be very much increased in order to render it at all effectual. There are, to be sure, some subjects on which civilized mankind has made up its mind so thoroughly that no government can resist it. The slave-trade, for instance, could not be revived in Europe or America by any government, however strong. But on the great number of topics of international law there is no such agreement, and it is precisely such unsettled points as these that the professors and jurists meet to discuss. On these there is no public opinion, and the settlement arrived at amounts to nothing more than the individual sentiment of a number of public-spirited gentlemen. That such men as Gortchakoff and Bismarck, or General von Moltke, will be governed by their decision is simply a delusion. To take a single instance: Russia has proposed a new war code which rules out of any future wars all irregular troops. It makes no sort of difference whether this is approved or disapproved by any association or number of associations, because the first country which finds it inconvenient will disregard it. No government having a large number of able-bodied men who can be turned let us say into "minute-men," will, on being invaded, throw up its hands and exclaim, "What a pity that the 49th rule of the 3d article of Dr. Miles's code prevents us from using them! If we only could use them, we might beat"; but will, on the contrary, drill every man it can find, and beat if it can. The abolition of privateering, it will be remembered, broke down on the very first occasion—the war of the Rebellion—on which it became important for a government to use privateers; and the rule of "free goods, free ships," solemnly laid down at Paris in 1856, seems likely to disappear in the first war in which a maritime power is engaged.

If there were any signs in politics of a disposition on the part of the leading modern powers to abandon the resort to force as the ultimate method of deciding international disputes, this would be pretty clear evidence of a distinct change in the condition of public sentiment. It might then fairly be said that, the world being about to enter upon a period of peace and good-will, the settlement of all difficulties and the reconciliation of all conflicting interests must be brought about by discussion, by agitation, by congresses and associations for the reform of international law. But there are no such signs. On the contrary, all the facts point the other way. With an exception of the United States, which is fortunate enough to be isolated by its position from the rest of the world, all the chief modern powers are exhausting their energies and ingenuity in preparations for war on a gigantic scale; and these preparations are made in such a way and on such a scale as to make war in the future much more popular and general than ever before. In the last century there were, it is true, standing armies, but now all Europe is a standing army. The most active minds, too, of the present day are engaged, not upon the problem of doing away with war, but of making war more terrible by overwhelming combinations, while a great part of the inventive genius for which the age is so celebrated, instead of being bent on turning swords into ploughshares, is devoted to the discovery and perfection of new engines of war. Under these circumstances, the notion that there is any tendency among nations to submit themselves to an international code, or that if they did they would abide by it, is absurd.

We say all this without the slightest desire to throw cold water on attempts to reform international law. But, in the main, any improvement which does not have behind it an immense weight of public opinion will necessarily be nugatory, because the force on its side will be insignificant by the side of the selfish and interested forces against it. The growth of public opinion must be slow, and agitation of it may be overdone. The danger of associations for the reform of international law is that, having no power except what they may derive from the support of governments, they will, instead of guiding, be guided, and, like so many other bodies organized for public purposes, will end by being "captured" by some of the very governments which undertake to support them. The great interest shown by Russia in these conferences, together with her remarkable professions of humanity and philanthropy, point, it has been said, in this way, and we fear that a suspicion of this kind will be likely to do the same kind of harm to the cause that suspicion of the "capture" of reformers by the "corruptionists" does in domestic politics.

## THE CERTOSA OF PAVIA.

DIJON, September 24.

THE history of Italy has never been so well told as by Sismondi. The title he gave his work was 'The History of the Italian Republics.' But the Italian Republics had little in themselves of true republican institutions or principles. I have always thought that the history of Italy would be more living, more true, more dramatic, if it were condensed in a series of histories of some remarkable families. Take, for instance, the Medici in Florence. How can the history of Florence be better told than by showing the progress and the downfall of the great family which, sprung from an apothecary's shop, rose so high finally that it could put the French *fleurs-de-lys* on its coat-of-arms, together with the round pills which still spoke of its modest beginning? Such histories of great races would be also the history of art, for the memory of the Medici can never be severed from the magnificent work of Michael Angelo in Florence. The Visconti are another and perhaps an even more extraordinary typical family. Their lives would illustrate the history of Italy better than dry accounts of facts, battles, and treaties. History, thus written in the biographical form, would not only give us the true value of the Darwinian theory in the field of human thought and action, it would really represent the state of Italy after the Middle Ages, when, in the absence of any great centralizing power, individual thought and action became predominant.

I look in vain in history for such a patron of art as this Gian Galeazzo Visconti, who planned and executed three monuments like the Duomo of Milan, the Certosa of Pavia, the Great Hospital of Milan. How could he find the means to undertake such gigantic works? He must have spent untold sums of money in order to realize his admirable dreams. I was looking a few days ago, at Turin, at the manuscripts of the library, which used to be the Royal Library when Turin was the capital of Piedmont. Among the manuscripts bought by Charles Albert there is one made for this same Gian Galeazzo which is the gem of the library. It is most exquisite, and contains as many as three hundred miniatures. At a public sale such a book would now fetch a fabulous price. Visconti was a devotee of art, an inspirer; and wherever he looked you will find some *chef-d'œuvre*. Nothing can exceed the original beauty of the Certosa of Pavia, which may be said to be his work, as he was in constant communication with the artists who planned and executed it. It was the fashion for all the great families to have a sort of Saint Denis. The Dukes of Burgundy had their Chartreuse outside of Dijon, where their magnificent tombs were under the guard of the friars. The Dukes of Milan had their Saint Denis

near Pavia. The Visconti were originally the lords of Pavia. Gian Galeazzo made a donation to the Church of a part of the park of Mirabello, the same in which was fought, later, the famous battle of Pavia, where François I., after a long struggle, was obliged to surrender. He laid the first stone of the new church in 1396, and in his will, written in Melegnano in 1402, he confirmed his donation.

It is very easy to go to the Certosa from Milan ; the railway brings you in less than an hour to a station called the Certosa ; ten minutes' walk brings you then along the high wall of the convent to a curious door, covered with frescoes, which are not quite defaced yet, though they have lost much of their original freshness. This door leads into a sort of gallery, which is also covered with frescoes. There are two of great beauty, which are the work of Bernardino Luini. It is impossible not to recognize at once the works of this painter, who forms with Leonardo da Vinci a school remarkable for some permanent traits, such as the ideality and mysterious character of the faces, a peculiar method in shading them which produces a sort of semi-chiaroscuro, the great nobility and distinction of the attitudes, and the simplicity of the draperies. There is great pleasure in arriving at such a close acquaintance with a painter as to be able to say at once, when you see one of his works, This belongs to him. You can hardly form such an acquaintance out of Italy. Luini and Leonardo must be studied in Lombardy, as Bellini, Veronese, and Tintorello in Venice. Borgognone cannot be known out of the Certosa of Pavia. This great man, born at Fossano, and known under the names of Ambrogio da Fossano or of Borgognone (which was evidently only a surname), was at the same time a painter and an architect. As a painter he was not without merit ; he has a certain dryness ; but his color is good and his drawing full of energy and of life. His best pictures are to be seen in the various chapels of the Church of the Certosa ; the best, in my opinion, is one representing Saint Syrus, the first Bishop of Pavia. Borgognone painted a great quantity of the frescoes which cover the vaults of the church, but he surpassed himself when he drew the plans of the celebrated façade, which is one of the gems of the artistic world. When you pass the great porch and enter the huge court, the façade rises before you, and you are struck at once by the beauty of its proportions, the elegance of its windows, the majesty of the principal door. Time has thrown a sort of pink tinge (by decomposing the iron, I suppose) over the beautiful Carrara marble of which the whole façade is made. The monotony of the white color is broken by the shadows, by many incrustations of precious stones, red and green porphyries, and the little bronze medallions which have been stuck here and there. The more you approach, the more you are struck by the richness and abundance of the details ; but the great art of the architect is shown in the fact that the details never destroy the character of the whole : they never conceal the style of the monument.

No description can do justice to the marvellous beauty of this sculptured façade ; it is a world of its own. The eye, wherever it looks, falls on what might be called a picture in stone, and each of these pictures has the grace of a Fra Angelico. You are struck everywhere by the curious contact of Christian beauty and of pagan recollections. This façade marks the very beginning of the Renaissance, the time when Italy married the Sibyls to the prophets, when she took pride in all the memories of antiquity without ceasing to be Catholic. In some medallions in stone you see scenes which may be called purely Roman, naked forms of men struggling, and so on ; while in others the human form is still enveloped in the costumes of the Renaissance. A series of medallions, quite on the lower part of the monument, represents the series of the Roman warriors and emperors. I can hardly insist enough on this curious collision of classic memories and of Christian and ideal aspirations, as this marriage is characteristic of the school of art which produced in Italy the finest works. There are defects in what came before, other defects in what came afterwards ; all is perfect during the time of this curious union. The façade, in all its charming details, is, as I have said, a whole world. How many men have worked at it—Antonio Amadeo of Pavia ; Marco Agrate ; Agostino Busti, called Bambaia ; Cristoforo Solari ; the admirable Giacomo della Porta, one of the greatest sculptors of all times ; Cristoforo Romano, and others. Whoever would have at a glance a correct view of the Alps need only go to Chamounix and to Zermatt. Whoever would see the genius of the Italian Renaissance in all its perfection, need only stop an hour before the façade of the Certosa.

Inside of the church there are some parts which are also, so to speak, gems of the Renaissance inserted in the garment of the ancient architecture. There is, first of all, the tomb of Gian Galeazzo : this tomb is very famous ; it is all in white marble. The stern face of the great warrior-artist has not been much flattered ; you would recognize it amongst a thousand by its long, pointed nose and by the pointed beard. Visconti sleeps under the vault of a monument which has six bas-reliefs, representing the principal events of his life. The artists who achieved this monument were Amadeo of Pavia, Giacomo della Porta, and Cristoforo Romano. The other gems are two doors leading from the central part of the church into the old and into the new sacristy ; one has the medallions of seven Dukes of Milan on it, and the other bears the medallions of their seven wives. In the choir there are two magnificent marble walls on each side of the altar. These walls are sculptured, and represent many subjects, which form horizontal divisions, similar to the superposed stories of a house. The beauty of some of these marble pictures, for they are really pictures, is truly extraordinary.

How much more there is to admire—the font at which the priests wash their hands before saying mass, the doors issuing from the church into the two long cloisters, the cloisters themselves with their terra-cotta ornaments. From these cloisters (there are two, one small and the other very large) you see the architecture of the church to great advantage. How simple and beautiful it appears ! There are stories of arcades rising one above the other ; the materials of this part are simple—you see nothing but the white of the stone or the chalk, and the red of the bricks and the terra-cotta ; but the smiling sun casts charming shadows, and the whole scene has an indescribable harmony. The friars allowed us to take luncheon in one of the rooms of the buildings which surround the great square leading to the façade. We had brought our provisions from Milan, as there is no inn near the Certosa. Through the open windows we could see the radiant façade, with its delicate ornaments and its mystic beauty. Nothing in such a place speaks of the vanity of things, nothing of death, not even the tomb of Gian Galeazzo. There is too much beauty in this abode of art. The poor friar alone, with his emaciated face, he who lives, speaks of death. I had the same impressions in the Certosa of the Dukes of Burgundy. Of all the tours which I have made in Italy, I remember few which have given me as much satisfaction as this visit to the Certosa of Pavia. The place is so solitary that a few hours spent in it are like a leap into the past ages. I returned with regret to Milan and its busy streets, its new statues of Cavour, and its noisy gallery, where all the inhabitants seem to congregate every day—a pandemonium of noise, smoke, newspapers, and vulgar shops ; and I wondered, as I was lounging in the evening under the inevitable arcade, whether anybody in the crowd had in him the soul of a Gian Galeazzo.

# Correspondence.

## DE LUNATICO INQUIRENDO.

To the Editor of The Nation :

Sir :

"It ought to be . . . disgraceful and ridiculous in our day and generation for a grown man to go about . . . trying to persuade people that good money could be manufactured by a printing-press. . . .

"The impossibility of dispensing with gold and silver as a measure of value ought to be by this time settled as one of the . . . facts . . . which are only questioned in lunatic asylums."—*Nation*, Sept. 30, 1875.

I doubt not that sagacious men quite generally agree to oppose further inflation of our "legal-tender" currency, but I am not yet able to accept all the propositions by which the *Nation* and other strong writers lead up to and fortify this conclusion. I write as an enquirer, however, not as a controversialist.

Does not a valid distinction lie between a *measure* of value, like gold, and *legal tender ?* Agreeing that gold is the measure of value that has attained an almost world-wide acceptance, does it follow that gold should therefore be the only legal tender, and that all currencies or other debt-certificates of whatever kind should be "redeemable in gold" only ? I detect in the general flow of commerce phenomena which I will call closed circles —*i.e.*, circles of exchange within which the same currency may revolve for ever, independently of gold. Such circles are, indeed, little short of countless. Some of them are very small, as, for instance, the dealings of a grocer with his milkman ; the grocer taking five dollars' worth of milk-tickets and crediting the milkman accordingly, and the milkman redeeming his tickets in milk—gold meanwhile serving the use of a measure both of the groceries and the milk.

Am I safe in asserting that wherever a closed circle like this can be demonstrated there is need of neither gold nor silver as legal tender ? True, if either party die and the business be wound up by strangers, *then* must come in an outside currency. But so long as the milkman and the grocer

continue in their respective relations, have we not here a trade of say one hundred dollars a year in which milk-tickets serve all the uses of currency?

From this smallest circle step at once to the largest circle—a sovereign government like the United States Government, with an undisputed right to tax out of the people say two hundred million dollars a year. The people at large are to pay to the national treasury, in the course of a year, two hundred million dollars. The Government is to disburse precisely the same sum to the people. Have we not here a closed circle, foreign creditors excepted?

Where lies the fallacy, then, in asserting that any stable government may wisely meet its obligations by issuing its notes promising to pay, just as our greenbacks do promise to pay? And inasmuch as by the tax law every citizen must pay to the Government, and these notes of the Government by their very face are receivable for taxes, why not make them, for all purposes of internal commerce, legal tender, their volume to equal at least the amount of the annual budget?

The Treasury-notes thus issued are on a large scale what the milk-tickets were on a small scale.

If the Government have a legal right to take from citizens at large two hundred million dollars, I am not able to see that there is any unwisdom or injustice in requiring citizens to recognize Treasury-notes—which are legal tender to the Government—as legal tender also in the settlement of private accounts. Meanwhile, gold may be serving a use as a measure of value, but not as the only legal tender.

Incidentally, of course, so large a volume of Treasury-notes as two hundred million dollars, thrown out among the people at large, will be retarded on its road back to the Treasury, serving the uses of currency, or as a basis of other smaller currencies; and a sum something larger than two hundred millions may be wisely issued. *How large* this additional sum may be made, is the open question between the inflationists and the non-inflationists or contractionists.

I cannot deny that when the currency-metre—gold—indicates that the legal tender is from ten to fifteen per cent. below par, there is *too much* of the legal tender outstanding, and no more ought to be issued.

Is it necessary, then, in order to return to specie payments, so called, to re-enact what seems a demonstrable absurdity—that gold and only gold shall be legal tender? I say demonstrable absurdity, because at whatever time of disaster the people at large, losing confidence, begin to drive each other by suits at law, and debtors can satisfy judgment according to the letter of the law with gold only, it is demonstrable that there is not gold coin enough in the world to serve the purpose. Why, then, proclaim gold the only legal tender when at a glance it is obvious that gold *cannot* serve this purpose?

My authority is a very high one (Walter Bagehot) for stating that the notes of the Bank of England were legal tender during the very days when it was notorious that the gold reserves of the Bank were already exhausted. The consols held by the Bank were the basis of this over-issue.

I am not able to see, then, any fallacy in the statement which I now repeat, that any stable sovereign government may wisely furnish to citizens at large Treasury-notes something in excess of its own annual collections in the way of internal revenue, and, by receiving them in payment of all dues to the government, actually redeem them. And these notes, issued by law and collected by law, are, and of right ought to be, the only legal tender; while gold stands by, serving its use as a measure of the unit of currency—a dollar.

Repeating my first remark—that sagacious men generally agree to oppose further inflation of our currency—I ask of the *Nation* to point out the fallacy of the above theories, not by demitting me to an insane asylum, but by some gracious condescension to my limited understanding, which is more my misfortune than my fault.

THOS. K. BEECHER.

ELMIRA, N. Y.

---

[In the case put by Mr. Beecher, the grocer credits the milkman with five dollars in groceries, and he takes tickets, not in payment of the debt, but as an easy mode of keeping the account. The debt is to be paid in milk, too, and not in money simply, as a mode of saving trouble to both parties. It saves the milkman the trouble of selling his milk to some one else, and carrying the money to the grocer; the grocer the trouble of selling his groceries to some one else, and carrying the money to the milkman. Mr. Beecher is quite "safe in asserting" that in this transaction there is no need of gold or silver, because it is a case of barter by special agreement, as when men swap horses or jack-knives. Such arrangements exist in great numbers in all civilized communities, and they are useful and possible as long as they are voluntary, but no longer. If Mr. Beecher will think the thing out, he will see that he is actually meditating legislation to compel the grocer to take milk tickets in payment for his groceries, whether he pleases or not, for this is what making a milk ticket "a legal tender" means. He will now probably ask, Where would be the harm of this as long as its value was measured in gold? To which we answer, that the only way of measuring the value in gold of a milk ticket, or of anything else, is by ascertaining how much gold you can sell it for or get in exchange for it. The grocer might, therefore, be willing enough to take the milk ticket if he knew its value in gold, and he could only ascertain this by trying to sell it for gold. If he found it would bring in gold what the milkman said on its face it would bring, he would take it, but in this case, as Mr. Beecher will see at a glance, the milk ticket would be simply redeemable currency, or paper convertible into coin at par on demand, which is always good money. If the milk tickets, on the other hand, were irredeemable, or, in other words, could not be converted into coin at par on demand, the grocer would not know what value to attach to them. He could not measure their value in gold; and if Mr. Beecher were to enter his store in the name of the law, and make them "legal tender," or, in other words, insist on his taking them whether he pleased or no, and allowed the milkman to pay in them all the debts he could contract, the grocer would incontinently shut up shop, while the milkman would run joyfully to the printer and order thousands of new tickets; "for now," he would say, "as I can pay all I owe in them, I will have as many as I please." Suppose, however, the milk tickets to be redeemable in milk only, the grocer would be no better off than ever. He would say: "I cannot tell how much milk I ought to get for my groceries, unless I have some common measure of value for both. I must, therefore, ascertain how much gold milk will exchange for before I can tell how much of it I ought to get for my tea. But the only way of doing this is by finding out what milk sells for in gold. I will, therefore, take tickets redeemable in milk if the milk is salable for gold at a steady price, but not otherwise"—so that in this case also, though by a more roundabout process, the tickets would be convertible currency; and what Mr. Beecher would gain by making them legal tender we fail to see. The little hallucination which lies at the bottom of his difficulty is the notion that he can use gold as a means of measuring the value of an article in any other way than by an offer to sell the article for gold to a person willing and able to buy it. This produces perhaps two-thirds of the schemes for dispensing with convertibility. If you really use gold as a measure of value, it must be the legal tender in the last resort. In Mr. Beecher's "closed circles," the use of the gold standard is suspended for brief periods, and in small transactions, as a matter of mutual convenience, but it is of course watched by both parties all the time, and any decline or appreciation in the value of the commodities dealt in would cause a change more or less prompt in the conditions of barter.

As regards Mr. Beecher's scheme of public finance, there is no fallacy in asserting "that any stable government may wisely meet its obligations by issuing its notes promising to pay," if it really means to pay, and mentions a time when it will do so. The objections to promises which are not meant to be kept, or which by their terms leave it in the power of the promisor to deceive the promisee as to the time when they will be kept, Mr. Beecher, being a clergyman, perceives as clearly as we do. Nor is there anything to be said against the receipt by a government of its own notes in payment of taxes. In this case, as we have stated it thus far, nobody need take the Government notes in payment of debts or the purchase of goods unless he pleases to do so, and thus nobody can be harmed by them. But if we allow them to be a legal tender "for all purposes of internal commerce," we find ourselves met at once by Mr. Beecher's little fallacy about the gold standard. "Meanwhile," he says, "gold may be serving a use as a measure of value." So it

may if the Government notes are redeemable on demand in coin at par, because then anybody who has them tendered to him knows at once what their value is. But if they are irredeemable they cease to bear any fixed relation in value to coin. Some days they will be worth more than others. If fresh issues are made by unscrupulous politicians, they will greatly decline in value as measured by gold. Now, suppose A sells B on the first of July goods worth one thousand dollars in gold to be paid for on the first of the following April, there being then $200,000,000 worth of Government notes afloat, circulating at par in gold. Suppose in the course of the winter that Kelley, Morton, Logan, and the like get possession of Congress, and conclude that the volume of the currency is not "up to the demands of trade," and procure the issue of $100,000,000 more notes, and direct that they shall not be redeemable in gold any longer, but that they shall be a legal tender as well as gold. They will then fall in value as measured in gold—say to 70 cents on the dollar. B will then rub his hands and say, "I will now sell my goods for $1,200 in gold; but although gold is a legal tender, so is Government paper: I will, therefore, not be such a fool as to pay A in gold. I will pay him in the cheapest legal tender I can get, and in this way shall have to give him only $700 in payment of my debt of $1,000, so that my total profit on the transaction will be $500, and A's loss $300, using the gold as a measure of value, which of course I will do." Mr. Beecher's citation of Mr. Bagehot has nothing to do with the matter. Issues of the Bank of England based on consols are the same thing as issues based on gold, because if notes were presented for redemption after the supply of gold was exhausted, the consols would be sold in order to renew it. $75,000,000 of the Bank notes are always based on consols. This is simply an arrangement by which, in effect, the Government agrees to see that a certain proportion of the Bank circulation is redeemed in coin on demand. But even if irredeemable Bank of England notes had ever been legal tender in discharge of debts, which they never were, it is obvious that as the world grows in financial experience it ought to grow in financial morality. Mr. Beecher does not need to be told, if we may illustrate from his own science, that the number of damnable offences grows in the ratio of the increase of light. Many a hardened repudiator and adulterator of the sixteenth century will get off with half the penalty that will be inflicted on Morton, and Logan, and Kelley, and Curtin, and Allen, and Carey unless they can plead lunacy. The objection, in short, to making irredeemable paper a legal tender is, that you at one and the same time remove the only check on the quantity issued and greatly increase the temptation to issue in large quantities. The contingency contemplated by Mr. Beecher, in which all creditors would sue their debtors for gold, is a favorite one with inflationists, but it is a creature of the imagination, and is of about the same value in argument as the old Democratic question: "Would you like your daughter to marry a nigger?" Man in society has always remained rational and patient in hard-money periods. It is under the irredeemable-paper régime that he grows frantic and irresponsible, and is ready to rush with his neighbor to ruin.—Ed. Nation.]

## THE BARINGS AND THE UNITED STATES GOVERNMENT.

To the Editor of The Nation:

Sir: In the last number of the *Nation* you say it is untrue "that the Barings unduly pressed the State Department for a small balance during the war."

In December, 1868, Mr. Benjamin Moran, at that time our Secretary of Legation at London, told Mr. George J. Abbot (then our Consul at Sheffield) and myself, in the office of the Legation, that it was *true* that Baring Brothers, as soon as the news of the breaking out of the war reached London, despatched a special messenger to the United States with a demand that the balance then due from the State Department (which, if my memory serves me right, was less than $100,000) should be paid at once. This messenger reached Washington on Sunday, and so urgent were the instructions of these alarmed creditors that Mr. Seward was not allowed his Sunday's rest, but was immediately importuned to make payment that very afternoon. Mr. Moran further informed us that, at the same time, Baring Brothers politely notified Mr. Dallas, our Minister, that his usual draft for the monthly salaries of himself and secretaries would not be honored.

When it is remembered that for more than a score of years the house of Baring Brothers had been reaping the large profits growing out of this agency for our Government—profits that had at that date undoubtedly reached an aggregate of millions—it is evident that their "pressure," whether "undue" or otherwise, showed just what amount of confidence they had in the stability of the Union.

William B. Hale.

Northampton, Mass., October 4, 1875.

[We are sorry to hear that Mr. Moran told our correspondent these stories, because, as we have said, they are untrue; only one of them has any foundation. They were set afloat in 1868, and called forth the following reply from the agent of the Barings, Mr. S. G. Ward, in the New York *Times* of October 15, 1868, as to the first:

"Messrs. Baring Brothers & Co., as bankers of the Government, keep accounts with the various Departments as separate as though they were so many different commercial firms.

"Of these the State Department account is the one involving the smallest amounts, being for the payment of diplomatic expenses chiefly. Messrs. Baring Brothers & Co. charge no commission or interest on this account, the understanding being the account will always be kept covered, so as not to involve a loss of interest to the bankers.

"In the autumn of 1862 this account had remained overdrawn for several months. The amount was not a large one, and was unimportant in comparison with the large transactions continually occurring with other departments. This state of the account was supposed to be, as doubtless it was, a mere oversight at the Department, and the gentleman from my office who had charge of the accounts, being in Washington on other business, was requested by me to call at the State Department and draw attention to it. Messrs. Baring Brothers & Co. knew nothing of the circumstance of the call, and I was not aware till years afterwards that any unfavorable construction had been put upon a proceeding so much a matter of course. When my attention was drawn to it I immediately made the above explanation, which was accepted by Mr. Seward."

Here we see that what happened to give color to this story did not happen as soon "as the news of the breaking out of the war reached London." The Barings did not despatch a "special messenger," and the messenger Mr. Ward despatched was not "special," and the account was an account on which no interest was charged, and payment of it was not demanded at once.

"The amount of confidence the Barings had in the stability of the Union" was testified to by Mr. W. H. Aspinwall in a letter to the New York *Times* of October 14, 1868, which was called forth by these same stories, and ran as follows:

"Rockwood, Tarrytown, Wednesday, Oct. 14, 1868.

"To the Editor of the New York Times:

"Having read in the *Times* of this morning the articles relating to the action of Messrs. Baring Brothers during the 'dark days of the war,' I think it due to them to mention a fact not generally known.

"When sent abroad with Mr. John M. Forbes, of Boston, with reference to the iron-clads then being fitted out by Mr. Laird, of Liverpool, we applied to Messrs. Baring Brothers & Co. for the means necessary to carry out the object of our mission. These gentlemen unhesitatingly authorized us to draw on them, at sight, for a very large amount—some millions—and on terms at once liberal and most considerate as to the time of reimbursement by our Government; thus showing a most exceptional degree of confidence and sympathy at a period when the public feeling in London was almost universally in favor of the South, and when United States five-twenty bonds were unsalable there, even at about forty.

"From motives of delicacy, no public mention has been made of this honorable act, which certainly no other house in Europe unaided could have or would have done; and it is now brought to your notice simply to counteract the statements of Mr. Stanton, who, I am sure, would not knowingly misrepresent any party who had co-operated with him in putting down the rebellion, and who could only speak as he did at Carlisle in ignorance of what had been done by the Messrs. Baring.—Very truly and respectfully yours,

Wm. H. Aspinwall."

We are afraid the story about the monthly pay of Mr. Dallas and his secretaries will hardly bear more scrutiny than that about the account of the State Department, particularly as it happened "at the same time."—Ed. Nation.]

# Notes.

THE Bunker-Hill effusion of good feeling towards the South is to be reciprocated on more ticklish ground by the Palmetto Guard of Charleston, who formally, in a well-written circular, invite all Americans to join

them in the centennial celebration of the battle of Fort Moultrie, fought June 28, 1776. This will involve forgetting a later incident associated with Fort Moultrie; but then we forgot last June that Toombs meant to call a slave-roll on Bunker Hill.——The *Atlantic Monthly's* "special attractions" for next year include very few new writers. Mr. Howells begins next month a New England story, called "Private Theatricals"; Mrs. Kemble's charming "Old Woman's Gossip" will run on; Mr. Charles Francis Adams, jr., will write with authority on Railroads, as Mr. Henry C. Lea will on Witchcraft. The magazine will continue to be a debating ground for opposite opinions on questions of public interest, such as free-trade, currency, the Catholics and the schools, etc.——The Rev. Edward D. Neill's latest brochure is an abstract, with notes, of M. Pierre Margry's articles in the *Moniteur Universel* on 'Sieur de la Verendrye and his Sons, the Discoverers of the Rocky Mountains' (Minneapolis). A native of Canada, this adventurer was the offspring of a marriage in which the wife was only twelve years of age.——Dr. James Read Chadwick has reprinted in an elegant manner (Riverside Press) his translation, which first appeared in the Boston *Medical and Surgical Journal* for June 17, of two letters on 'The Climate and Diseases of America' by Dr. Johann David Schoepff. The writer was eminent in his day among the medical profession, and came over to this country during the Revolution as surgeon of the Anspach-Bayreuth mercenaries. He was an unfriendly but an honest and capable observer, and these letters lead one to wish that his narrative of travels in the Middle and Southern States, published seven years later (Erlangen, 1788), were equally accessible to English readers. Dr. Chadwick's translation and illustrative foot-notes are of the best.——G. P. Putnam's Sons have in press 'The Philosophy of Religion,' by President John Bascom, of the University of Wisconsin; and 'Faith and Modern Thought,' by Prof. R. B. Welch, of Union College. In describing, by the way, the Messrs. Putnam's 'Family Atlas,' we stated but a part of the truth when we said that it was composed of the several student's-atlases already issued by that house. It really contains all their maps, and as many more which belong peculiarly to the 'Family Atlas'; and the letterpress has been considerably extended. It will, therefore, be found still more handy and valuable than we had suggested it would be.——The article on *Poker* in the new 'American Cyclopædia,' we observe, quotes Gen. Schenck as the standard authority. Another, but a Democratic, politician, Mr. S. L. M. Barlow, furnishes the article on *Piquet*.——J. B. Lippincott & Co. have in press a brief treatise on 'Punctuation,' by Prof. Joseph A. Turner; 'The Kiss: in History, Fiction, Poetry, and Anecdote,' by C. C. Bombaugh; 'The Prose Miscellanies of Heinrich Heine,' translated by S. L. Fleishman; and two volumes of poetry—'The Roll Call,' by George Johnson; and 'American Boyhood,' by Horace P. Biddle.——We learn that J. H. Coates & Co., Philadelphia, have engaged Prof. Henry Coppée, an old West-Pointer and well-known author of military works, to edit and annotate their forthcoming translation of the Comte de Paris's 'History of the Civil War.' The same house will shortly issue 'Lectures delivered in America in 1874,' by the late Canon Kingsley, edited by his widow.

—Additional announcements of English publications embrace a review by Matthew Arnold of objections to his 'Literature and Dogma,' in a volume bearing the more direct title of 'God and the Bible'; a new work in the series of biographical studies by John Morley, on 'Diderot'; 'Great Britain during the Reign of Queen Anne,' by F. W. Wyon; extracts, edited by Dr. Doran, from the correspondence of Sir Horace Mann and Walpole, called '"Mann" and Manners at the Court of Florence, 1748–86'; the prose works of Sidney Dobell, edited by Prof. Nichol; 'Forty Years' Recollections,' by Dr. Charles Mackay; 'Poems, Essays, and Speeches,' by the King of Sweden; 'Don Carlos and the Basques,' by Mr. MacGahan; and the following books of travel: 'Explorations in Australia'—the three remarkable expeditions of John Forrest, narrated by himself; 'Eighteen Months' Wandering in Western Isles and Eastern Highlands,' by Miss C. F. Gordon Cumming; 'Two Trips to Gorilla Land and the Cataracts of the Congo,' by Capt. R. F. Burton; and translations of Edward Mohr's 'Victoria Falls of the Zambesi' and of Lieut.-Col. Prezhevalsky's 'Travels in Mongolia,' with annotations by Col. Yule. Translations also of Von Reumont's 'Lorenzo de' Medici' and of Claretie's 'Camille Desmoulins' are announced—the former by Robert Harrison, the latter by Mrs. Cashel Hoey.

—A clergyman among our subscribers asks our aid in exposing an annual bore whose circular he encloses. This is none other than the "Great American Literary Association" of Yellow Springs, Ohio, which, "*as its name implies*," says the impudent circular, "has a widespread reputation." It further says of itself that it is "the oldest and only permanent and reliable institution of the kind in the United States, having stood the test for many years." It has "a corps of able and experienced writers that enables us to furnish applicants, on short notice, with all kinds, styles, and grades of literary exercises, consisting of essays, lectures, orations, sermons, salutatories, valedictories, poems, abstracts, reviews, critiques, translations, etc." "Applicants must state the occasions on which they wish to deliver the exercises, and such exercises will be written suitable and appropriate [*sic*]; and also, whether a strictly first-class production is desired." In the latter case more time must be allowed, and the "moderate charges" are presumably higher. Profiting by a "special announcement" to this effect —"We would caution the public against several bogus literary bureaus and cabinets, originated by irresponsible parties, unworthy in character and mental ability"—we beg to call the attention of the government of Antioch College to the Great American Literary Association, as answering to the above description, and as having a dangerous proximity to their institution; and to the inference likely to be drawn from the statement that "all who have been in connection with the 'American Association' and those in connection with it now, are *graduates*, and consequently, having gone through 'the mill,' know just what kind of exercises students need and desire." The one or at most two persons at the bottom of this fraud can probably be detected making liberal use of the College library.

—The *Telegrapher* of this city expresses the surprise which every American must have felt on reading the opening address of Sir John Hawkshaw at the late Bristol meeting of the British Association for the advancement of science. In his review of the progress of telegraphy, the part played in it by the United States was absolutely ignored; and yet, as the *Telegrapher* points out, our American instruments of transmission have largely superseded in England the native contrivances, while within a comparatively short period we have contributed to the practical development of the science the public and the automatic private fire-alarm telegraph systems; the various printing instruments which paved the way for the American stock-quotation telegraph system; the district-telegraph system, an invaluable addition to the police of towns and cities; and the duplex and quadruplex instruments for the simultaneous transmission of messages in opposite directions on the same wire. Moreover, in this field as in others, American invention fairly overleaps itself. While the dispute was still raging as to the ownership of the patents which enable a telegraph company to double and quadruple its capacity without increasing its wire mileage, Mr. Elisha Gray, of Chicago, had brought out what he calls his electro-harmonic apparatus, which seems capable of indefinite extension, and promises to throw quite into the shade Paganini's performances upon a single string. He has just proved by actual experiment between Boston and New York that four messages can be sent simultaneously in one direction over a single wire, and is now engaged in doubling his apparatus, so as to transmit eight messages at one time. It is confidently believed that sixteen messages are practicable, and that even this limit is far from being a final one. The transmission, too, may take place in opposite directions without interference. The principle of this wonderful invention consists in communicating to the wire the vibrations of an electrotome or "sounder" tuned to a certain pitch. At the other end, a sounder correspondingly tuned catches up these vibrations and hums responsively, and the interruptions (made by breaking and closing the circuit) which constitute a message are repeated with equal fidelity. What remains to be discovered is how many composite tones a wire will transmit, or, in other words, how many sounders, each of a different pitch, can be employed. But an invention which already, we may say, multiplies by sixteen the wire mileage not of a company but of the world, is certainly worthy of mention at the next meeting of the British Association.

—America is frequently reproached for the slenderness of its dramatic literature, but we do not believe that all Europe can show a greater curiosity than a play just published in this city by F. W. Christern. 'Charles Rovellini: a Drama of the Disunited States of North America. By Joseph Rocchietti, from Casale Monferrato,' has five pages of dedication to the "spirits of my dear sons John and Charles," followed by ten pages of preface. The play is preceded by this "argument":

"Colonel Anthony and Mrs. Charlotte Rovellini, both from Massachusetts, had a son and a daughter. Charles, the first-born, and the protagonist of this drama, was betrothed to Miss Virginia Holmes, a rich young lady of the South. During the dictatorship of Abraham Lincoln, the Rovellini family lived in New York. Mother, son, and daughter were patriotic worshippers of their sacred Constitution of the United States of North America. The father was a Tory, sympathizing with American aristocracy, or falsely called Republicans. Family dissension is the subject of Act I.; the despotic draft, Act II.; Act III., the desertion of Charles; a

martial trial, Act IV.; and Act V., the death of Charles and Virginia, with reconciliation in heaven."

This would seem to suggest a cross between the *autos sacramentales* of the Spaniards and the *Tendenzroman* of the Germans; but the view of heaven promised in the argument is omitted in the play, which mostly consists of long tirades, in which Mr. Charles Rovellini from Massachusetts denounces the wickedness of the North in fighting the war of the Rebellion. In his polemical preface the author informs us that he "attempted to publish this drama even under the terror of Lincoln." He acknowledges, however, "that, and even, had this work been published in that time, it could not save the country, for the reason that the whole Northern States, against the South, had culminated to blind madness." The author further says he is a naturalized Italian who lives in Linden, Union County, N. J., where he was elected school-superintendent by the Democrats during Lincoln's Administration, but was unable to hold the office, as he could get no one to act as security. So it was given to a Republican, whereupon Mr. Rocchietti wrote many letters. "Mr. Ben. Wood honored" him by publishing one of them. Mr. M. Pomeroy published some of them also, but, it appears, not the best. "In him I did not find the Democrat I expected." But this preface, curious as it is, is not as curious as the play itself. It is written in blank verse, of which this is a sample (p. 28):

> "Traitress, rebel
> With Charles, therefore, am I. Deceived we all
> By this administration, are. Myself
> A shield will be to Charles. Against the laws
> Of liberty he is drafted. Wishes not
> Nor he can, 'gainst the brothers of Virginia,
> Her friends and father, fight: betrothed to her
> Is Charles. You hope in vain to change his heart."

—An editorial article in the Boston *Advertiser* of October 1 is worthy of notice, and may, perhaps, serve as a text from which to preach a short sermon. All will admit that a knowledge of the area of the different States and Territories which, together, constitute the "United States" is a desirable thing. Many questions of social and political economy are more or less intimately connected with the extent of the surface of the different political divisions of the country, whether States, counties, or towns are the subjects of discussion. That the area of any region is not something which can be ascertained without any trouble, seems a statement hardly needing explanation; and yet it would appear, from the tone of many newspaper articles, that nothing but a little figuring is needed in order to arrive at a correct result. The fact is, that the areas of the different States of the Union which are given in our geographies, gazetteers, and official publications are only approximations; and that they are sometimes hardly that is shown by our being told now that the area of California is not so great by 32,261 square miles as has been generally stated and believed. A margin equal in extent to the whole State of Maine is a pretty large one! And the question naturally arises, If such a mistake, in the case of California, has been so long standing in our books, how is it with the other States? Are any of their areas to be enlarged or diminished by a few hundreds or thousands of square miles? To answer these questions, even in part, it will be necessary to begin by asking, Who is responsible for the figures which are now current? To this it may be replied, that the U. S. Land Office is the proper authority on this subject, at least for those States and Territories which belong to our Public Lands. And this would lead us to go to the Land-Office publications for information in regard to all the States except the old thirteen, and one or two others which were allowed to retain the ownership of their territory when admitted into the Union. To find out who is responsible for the computation of the areas of these older States would not be an easy matter. This much may be said at once, however: that there is not a State in the Union of which the area is accurately known, because there is not one which has been accurately surveyed. But to find out what the probabilities of error are, in the case of the older States, would be an extremely laborious task. It is known that their boundaries have been, in most cases, very inaccurately determined, and it would hardly be possible to hazard a guess as to what amount of error would be revealed when precise measurements and careful computations came to be made. In the case of the Mississippi Valley and Pacific-Coast States, there is no difficulty in getting a tolerable approximation to their exact area, wherever the Land-Office work has been extended so as to cover their entire surface. But it is only in the States bordering on the Ohio and the Mississippi that this has been done; further west these surveys, except in Kansas and Nebraska, are usually limited to small detached districts, which, all together, make but a small fraction of the whole area. Two or three of the States, however, are bounded exclusively by lines of latitude and longitude, and, of course, in these instances a close approximation to their areas can be obtained by simple computation. For all the others we shall have to wait a long time before we know the exact number of square miles which they contain. There is no need, however, of any such gross error as that committed by the Land Office in reference to California; and this blunder was, long ago, pointed out and the correction made in several works published in that State. Mr. Hittell, in the second edition of his 'Resources of California,' published in 1866—the first is not at hand for comparison—gives 160,000 square miles as the area of the State; the second edition (1867) has the same figures. Mr. Cronise, in his 'Natural Wealth of California' (1867), gives 158,687. The United States Land Office, therefore, while much to blame for allowing the erroneous figures of 188,981 square miles to remain so long on its books, cannot claim any merit for having, after so many years, made the surprising discovery that its previous result was 32,261 square miles out of the way. This last result of its labors—156,720, according to the *Advertiser*—differs only 1,967 square miles from that given by Mr. Cronise eight years ago. A repetition of the computation made at the Land Office is still extremely desirable, since the work which is done there has no reputation for accuracy; and no one at present can put any confidence in a result coming from that quarter in regard to which the methods and details are not given in full. And it must be added that the Coast-Survey work in California is yet far from being finished, the charts published up to this time being, in large part, "preliminary" only. The main triangulation, even, is still far from being completed; and, until the coast-line has been laid down with accuracy, the area of the State can only be approximately given, even after the computation has been made according to the best methods and with the greatest care.

—We have been startled by receiving the "draft of a constitution" ". . . for consideration and discussion by the citizens of the Centennial State," *i.e.*, Colorado. It is the production of a gentleman who, during the past twenty-five years, and while engaged in the active practice of the law, has "devoted himself to the investigation of legal and educational sciences, and to the work of legal and educational reform." It is a sad commentary upon the degree of estimation into which honorable public ambition has fallen to know that the author of this no doubt necessary work desires to publish it anonymously, for the purpose of rendering it impossible for even the most envious politician to "imagine in the author a possible rival for office." A number of the citizens of Colorado, however, have formed themselves into a committee for its publication, without making themselves responsible "for a single principle or opinion maintained or advocated in any part of the work." The constitution is in the main Benthamic, and contains many features rather novel in their character, as well as a good deal of phraseology of a sort that we do not often meet with in constitutional literature. The 4th article, for instance, is called "Ends and Means," and under the second head we are informed that "the means sought to be employed are: (*a*) the maximization of official aptitude, and (*b*) the minimization of expense," and that "rewards, charges, or punishment" imposed by law in violation of these among other principles, will be "declared void by the judiciary on all appropriate occasions"—a rather comprehensive announcement. All oaths are abolished by the Declaration of Rights, partly on the ground that "no Christian can take an oath without violating the express command of the author of his religion." Bills passed by the legislature are to be referred to the people for ratification in many cases, and the people in voting on the constitution are to give their proxies for the legislature, and any one receiving one thousand proxies becomes a member, while by a curious kind of minority representation "any person receiving more than five thousand proxies may transfer and distribute the excess to such respective persons as *he may think* will be most acceptable as the respective delegates of the persons whose proxies he respectively transfers; *provided*, that each such transferee shall (such transferred proxies included) be the holder of not less than one thousand proxies." The chief officer of the State is to be the "Minister of Justice," who is also to fill the office of President of the Supreme Court, and the author of the draft gives pretty conclusive evidence of his faithfulness to Benthamic principles by recommending that, "in place of the laws of evidence heretofore in force, the principles laid down in the 'Rationale of Judicial Evidence,' by Jeremy Bentham," be adopted "as the only rules of judicial evidence in force within the State of Colorado." This he thinks will be the only way in which the iniquities of the existing legal procedure can be done away. All "codes" heretofore adopted, he says, have been but palliatives of "monstrous wickedness," and as for that of New York, on which most of the new States have modelled theirs, he says that it "enabled David Dudley Field and 'Brother Shearman' to concoct their infamous plots by which Jay Gould and Jim Fisk stole railroads from their owners, while not one cent has been able to be recovered in all these years of the millions

stolen by 'Boss Tweed' from the people of New York." It is perhaps partly on account of this vigorous language that the more prudent fellow-citizens of the author decline to commit themselves to all his proposals.

## THE HISTORICAL VALUE OF BIOGRAPHY.*

MRS. FLETCHER'S life illustrates both the worthlessness and the worth, in an historical point of view, of ordinary biography. Any student who expects to gather from her autobiography a single new fact of any importance is doomed to disappointment, yet the hope for valuable information can scarcely be called unreasonable. Mrs. Fletcher was the Madame Roland of the Edinburgh Whigs. She, like the heroine of the Girondins, was married early in life to the grave, elderly, virtuous reformer whose main interest was the maintenance of a respectable though arid Liberal creed in the midst of a society which looked upon every Liberal as a Jacobin, and was inclined to check the progress of democratic principles by the use of social persecution. Mrs. Fletcher's great beauty, her keen sympathies, her ardent zeal for the public good, naturally made her the idol of the Liberals, of whose society she was the ornament, and obtained for her the good-will even of Tories, who, while they deplored her political heterodoxy, could not be insensible either to her feminine graces or to her moral worth. She thus during her youth and middle age saw and knew intimately most of the writers and politicians who were the glory of Edinburgh at the beginning of the century. Towards the close of her long life (she was born in 1780 and died in 1856) she was loved and admired by men and women, who saw in her the charming representative of a past age, the celebrities of which had become historical characters. Wordsworth, Jeffrey, Arnold, Carlyle, and Mazzini were among either the surviving friends or the younger acquaintance of her later years. To all this it must be added that she preserved till the end of her days the vivid interest in public life and the keen sympathy in the affairs of her friends which had distinguished her youth.

From such a woman, who had led such a life, it is surely not unreasonable to expect interesting reminiscences, but even the most moderate expectations will, as we have already intimated, be disappointed. Here and there throughout the three hundred and odd pages which make up the autobiography, it is possible, indeed, after careful search, to pick up one or two traits or dicta of celebrated persons which have some slight interest. Wordsworth's courteous remark in return for thanks on account of an act of kindliness, "I always feel that those who receive a benefit kindly also confer a favor," is not only characteristic of the poet, but embodies a maxim which might well receive careful attention even from persons of generous nature. The letters in which Lord Jeffrey expresses his appreciation of Arnold's virtues and the kindliness of his feeling to an old friend, betray a side of the critic's character which one might otherwise overlook. The history of Mazzini's friendship for Mrs. Fletcher, kept up as it was in spite of differences in political views, exhibits both of the friends in a most favorable light, and one or two of his letters given in the autobiography bear, like everything that extraordinary man ever wrote or said, the marks of his originality. But though it would be possible to pick out isolated reminiscences of more or less interest, Mrs. Fletcher's autobiography is singularly devoid either of interesting information, or of that peculiar fascination which is to be found in the unconscious sketch which autobiographical memoirs present of their author. Nor is the cause of these defects far to seek. Mrs. Fletcher was totally deficient in literary talent. The sympathetic feeling itself which enlisted the affection of her friends is not a quality easily compatible with critical discrimination. A lady who could write of Mrs. Brunton, the author of a dreary novel called, if we mistake not, 'Discipline': "To me she has as much surpassed the author of 'Waverley' in taste as she has in sentiment. Is it not more pleasing to soar than to sink almost buried in the mire?" may exhibit the strength of her moral sentiments, but betrays an utter want of critical taste. Readers who think it worth while to study the letter in which this estimate of Mrs. Brunton appears, will find no difficulty in accounting for the fact that Mrs. Fletcher, after associating on terms of warm friendship with some of the foremost men of the age, should have been unable to reproduce, in the whole course of her autobiography, a single lifelike portrait of any one of the persons who are the objects of her love or admiration. The dry intellectual correspondence of Miss Aikin and Dr. Channing has at least the merit of affording a sketch of each of the correspondents; Mrs. Gilbert's charming autobiography teems from beginning to end with pictures which novelists might be glad to borrow; but Mrs. Fletcher's reproduces nothing but a record of the esteem with which she was regarded by distinguished friends, whose virtues and talents were the object of her uncritical and sympathetic appreciation.

But this very autobiography, which contains neither information nor descriptions worth the attention of any historian, possesses nevertheless, partly because it is a very commonplace work, an historical value in which it is hardly possible that any genuine memoirs should be deficient. Its worth consists in affording an unconscious, an inartistic, and therefore a truthful picture of the spirit of the generation to which the writer belonged. History can tell, and ought always to tell, the events and transactions of an age; but no general history can portray the spirit which gives the tone and coloring to each successive era. This can be found in memoirs alone. Nor does it much matter for the historian's purpose whether the writer of a given memoir be a person of talent, or even whether he knows what are the events in themselves worth recording. All that is of importance is that he should really reproduce his own sentiments, and that these sentiments should be as far as possible the current commonplace feelings of his time. A writer who does this tells the sagacious investigator of the past exactly what such an enquirer wants to discover. The very remarks which the author of a diary omits to make are often as instructive as his set reflections. De Tocqueville, for example, draws an important inference as to the feeling of a past century from the fact that a lady writing to her mother tells of some executions which would shock the humanity of modern times without giving the least sign that they excited any abhorrence in her mind; and inferences of this kind, if they be only made with caution, are certainly some of the most valuable as well as the most certain conclusions to be drawn from the records of the past. To an attentive reader Mrs. Fletcher's account of her life will appear singularly instructive in reference to the sentiments of an age which, though so little removed from our own, differed in many points in feeling and opinion from the present time.

To take one, and on the whole the most salient, example of our meaning—there is nothing more striking throughout the whole of Mrs. Fletcher's book than the intense public spirit, or, to speak more accurately, the extreme interest in politics, which prevailed in the circle to which she belonged. She describes Mr. Fletcher as a man who had devoted his life to the emancipation of Scotland from the vile system of irresponsible municipal government and Parliamentary corruption which disgraced and depressed it and made it a bye-word among its English neighbors. "This feeling," she adds, "was so strong in my husband's mind that it might be called his master-passion," and no one can doubt from the whole tenor of the book that this assertion was true both of Mr. Fletcher and of many of his friends. When he was almost at the point of death, he roused himself to drink the health of the Greek revolutionists. His wife's sympathetic nature reflected the enthusiasm of her husband and of his companions. The year 1831 was darkened to her by the heaviest domestic troubles, but it is quite clear that amidst all her suffering her spirit rose with the triumphs of Parliamentary reform. The most touching and most impressive sign of this fine public spirit is to be seen in a letter on the death of her son "in the freshness and beauty of his youth." It is just such a letter as the most loving and sorrowful of mothers might write. It ends with the remark, "I have much comfort in the reflection that he *lived to see better prospects opening on his country*, and that no action of his public or private life was unworthy of his father's son." The words we have underlined are the perfectly simple and natural expression of the feeling of one who entered heart and soul into a great public cause and wrote to friends who she assumed would share her patriotic interest. The sentiment was the natural sentiment of 1832. It is not the mere enthusiasm of an excited woman. Precisely the same tone is to be discovered in the private diary of a hard-headed Scotch lawyer like Lord Cockburn, or in the striking record which John Stuart Mill has left of the feelings excited by the Reform agitation among the Benthamite society who gathered round his father. Nor should it be supposed that this ardent political interest was confined to one school or party. The Tories who, with Scott, opposed reform were as zealous for what seemed to them the cause of their country as were the men who fought for reform under Brougham and Jeffrey. The point to note is not patriotism of the one party or the other, but the fact that keen interest in public affairs was the natural sentiment of the time. It was the natural sentiment of 1832 as certainly as in England, at least, it is not the predominant feeling of 1875. We may be pretty sure that no mother consoled herself for the death of a beloved son by the reflection that he had lived to see Mr. Disraeli's Reform Bill pass into law. It is impossible not to recognize that, as regards interest in politics, a strange change has come over the public mind of England within the last forty years. A painful thought suggests itself that this alteration is due to a decline in public spirit. A man like Grote, whose life had been spent in the

* 'Autobiography of Mrs. Fletcher.' Edinburgh: Edmonston & Douglas.

service of his country, though he saw the triumph of nearly every cause which he had advocated, indubitably felt at the end of his career that the triumph was marred by a fear that the public spirit by which it had been attained had more or less declined. It may perhaps be possible to show that the obvious change in sentiment is rather an alteration in the direction than a decline in the amount of zeal for the welfare of the state; but this is not a topic which we can at this moment consider. Our object is not to account for a revolution in sentiment, but to show that such a revolution can be traced in the pages of a very commonplace autobiography, and that the most ordinary memoirs are of supreme historical value, as preserving traces of those subtle movements of opinion which constitute what is vaguely described as a change in the spirit of the age.

## RENAISSANCE IN ITALY.*

NO period perhaps of modern history presents so many unsolved problems as that which we term the Italian Renaissance. In no other period is there such an immense distance between the real and the ideal, between the artistic products of the human mind and the state of society in which they were produced. When we gaze on the Holy Virgin and Saints of Fr. Francia and Perugino, it is hard to realize that these artists lived during the pontificate of Alexander VI. This is but one example of a dissonance which is felt throughout this period, but which is rarely expressed in contemporary works. We might read Ariosto, Berni, and all the rest of the brilliant band of *seicentisti*, and never dream that their Italy was a devastated, tyrant-ridden country, a moral pest-house. Boiardo alone takes leave of the reader in his unfinished poem with the words:

"Mentre ch'io canto, oh Dio redentore!
Vedo l'Italia tutta a fiamma e foco
Per questi Galli, che con gran furore
Vengon per disertar non so che loco."

In fact, so boundless was the anarchy of that time that Gregorovius, in his recent work on Lucrezia Borgia, can remark with perfect truth: "If we should put a man of our own day, educated in the midst of our civilization, back into the period of the Renaissance, the daily barbarity which produced no impression on those who then lived would destroy his nervous system and perhaps drive him mad."

It is of this period of cruelty and courtesy, when Cæsar Borgia planned the celebrated massacre of Sinigaglia, and Castiglione wrote his treatise on the courtier, that Mr. Symonds has undertaken to write not so much a complete history as a résumé of the most important facts in political history, literature, and art. The author was previously favorably known by a work on Dante and sketches in Italy and Greece, in which, if he did not display any great originality, he made good use of his materials and produced readable and valuable works. The same may be said of the volume before us, which is devoted to the political and social history of Italy during the Renaissance, and is really a series of essays on the Spirit of the Renaissance, the Age of the Despots, the Republics, the Florentine Historians, Machiavelli's 'Prince,' the Popes of the Renaissance, the Church and Morality, Savonarola, and Charles VIII. A second volume will treat of the Fine Arts and the Revival of Learning, and a third of Italian Literature. This arrangement, by which the work is separated into three parts, with the necessary compression of all or most of the historical details into one volume, is open to the criticism that it not only diminishes the interest in the whole, but either renders much repetition necessary or severs literature and art from the circumstances to which they owe their being and form, and so violates a well-recognized canon of modern criticism. However, Mr. Symonds has put together a large amount of valuable information: he seems to have read widely and judiciously, and to have consulted the latest authorities on the subject.

There is some difficulty in fixing the limits of the epoch of the Renaissance. Considered politically, the most interesting period is that embraced in the close of the fifteenth and the first quarter of the sixteenth centuries, and it is to this period that Mr. Symonds devotes the greater part of his first volume. On the other hand, when the Renaissance is considered as the revival of learning, it is necessary to go back at least as far as Petrarch and Boccaccio, and a thorough method would establish the continuity between the Italy of Augustus and the Italy of the Medici. This part of his work the author will doubtless treat fully in a future volume. The petty princes from whom the 'Age of the Despots' takes its title—the Viscontis and Sforzas, the Malatestas and Dukes of Urbino, and even the Medici and Popes of the period, with one exception—arrest our attention in a much slighter degree than do Alexander VI. and his son Cæsar Borgia, Savonarola, and Machiavelli, four men who are types of their country and age.

Precisely why the Borgias have acquired such interesting infamy it is hard to say. Gregorovius declares it to be their relation to the Church, which is their constant background, and it is the awful contrast between them and the Christian ideal which makes them demoniacal. Had Rodrigo Borgia never been Pope Alexander VI., he would have been forgotten long ago in the host of equally great sinners whom the Renaissance produced and cultivated. It is impossible to speak of Cæsar Borgia without thinking of his panegyrist, the Florentine secretary and historian Machiavelli, and this connection of their names has been the punishment for the latter's sins. Mr. Symonds's treatment of Machiavelli is in the main just, although we do not think he gives him credit enough for the fundamental idea of the 'Prince,' nor for his services to his country—services so little appreciated and so ungratefully repaid. The question in regard to Machiavelli's 'Prince' has, it seems to us, been settled for some time, at least in Italy, where the admirable article by De Sanctis, in his 'Storia della Letteratura Italiana,' leaves nothing to be desired.

Machiavelli did not dream as Dante did of an ideal Italy (which perhaps is now realized), but he regarded his country as it was, and asked himself what was best for it, or rather what was indispensable to draw it from its abject condition. We must not forget that to him belongs the idea of a national militia, nor that he bitterly opposed the system of mercenary warfare which was ruining the country. He saw what Cæsar Borgia had accomplished in the Romagna at the head of his own forces, and felt that he was the only Italian who had a clear object in view, towards which he marched with indomitable will; and Machiavelli's dream of an Italian prince who should crush the petty tyrants about him, drive out the foreign invader, and build up a powerful state like France or Spain, might in a measure have been realized had Alexander VI. lived a few years longer. It was not to be, however, and Italy had to wait during more than three centuries of misery for national unity. It is an interesting fact that the true import of Dante, Petrarch, and Machiavelli has been felt only since Rome became the capital of the Italian nation.

Another striking example of the dissonance mentioned above as existing during the Renaissance is the fact that the same society, the same Church, that produced Alexander VI. produced also Savonarola. Mr. Symonds adds nothing to what Villari has already told us in his admirable monograph on that extraordinary man. There is one dramatic scene in his life which we fear must be pronounced destitute of truth, although novelists will doubtless continue to make use of it. We refer to the deathbed of Lorenzo de' Medici, to which Savonarola is said to have been summoned, and where he made three requests of the Magnificent: "To have a full and lively faith in God's mercy; to restore what you have unjustly gained; to give back liberty to Florence." The story goes that the dying man assented readily to the first two requisitions, but at the third he turned his face in silence to the wall. Villari, after a careful examination of the authorities, thinks the story true, and one of the two latest writers on this period (Von Reumont, 'Lorenzo de' Medici') gives good reason for accepting the tale with caution; but the second (Capponi, 'Storia di Firenze') expresses a distinct disbelief in it. There are enough authentic dramatic incidents in Savonarola's career without this one, and he will always continue to be one of the most interesting figures of his age, of which he himself is not the least problem. In connection with this subject, Mr. Symonds gives an account of the religious revivals in mediæval Italy, and shows that they proceeded more from the heart than from the head. This was also the case with Savonarola's reforms and one cause of his ultimate failure.

* 'Renaissance in Italy. Age of the Despots. By John Addington Symonds.' London: Smith, Elder & Co. 1875. 8vo. pp. xvi.-574.

## GREEK AND ROMAN LIVING.*

THIS book, of which the German original has long been favorably known, owes its existence to Karl Reimer, the publisher. Reimer, an active, stirring man, full of ideas and full of enthusiasm, and born with an instinct for divining the wants of the literary public, was on terms of intimate friendship with many of the leading philologists of his day. From conversations and intercourse with them he gradually conceived the idea of a book illustrating Greek and Roman life in a way different from any existing work. He applied to Professor Ernst Guhl, who had made a name by his work on Ephesus and by his 'Monuments of Ancient Art,' published in connection with Caspar. Guhl associated with himself Professor Wilhelm Koner. These scholars portioned out their work in two parts, and began

* 'The Life of the Greeks and Romans described from Antique Monuments. By E. Guhl and W. Koner. Translated from the third German edition by F. Hueffer.' New York: D. Appleton & Co. 1875.

in real earnest; but the good publisher did not live to see the book in which he took so hearty an interest finished, and a year after its publication Professor Guhl himself died, to the great loss of literature. The first edition, published in 1861, has been followed by two others in Germany, revised by the surviving editor.

In illustration of ancient life, great use has been made of monuments of art—architecture, sculpture, and painting. The 543 woodcuts with which the text is embellished are unequal in execution; the architectural engravings and views of places strike us as better drawn and better engraved than the representations of the human form. Compared with the first German edition, the impressions of the English-American book appear at a disadvantage. The plates are apparently worn, and, while some of the cuts have a dauby look, others are faint and somewhat weak. Still it must be acknowledged with gratitude that the illustrations supply an important want. Comparatively few people interested in antiquity have ready access to large libraries and archæological works of the highest class; fewer still are so fortunate as to grace their own libraries with these expensive luxuries. Even photographs, which are beginning to play an important part in education, are tolerably expensive, and cannot be collected to advantage without some previous knowledge of the subjects. Another thing which cannot be too much commended is that the engravings are embodied in the text, and not packed away by themselves at the end. Everybody has heard of the student examined in geometry who began to say by rote, "Let A B represent the line," when he was brought up by the examiner. "But, Mr. Jones, hadn't you better refer to the diagram at the end of the book?" "Oh," said he, "what, cuts? Bless my soul, I never thought of looking for any cuts." Too many people are of this lazy turn of mind, and any one who has made much use of such inconvenient books as Müller's 'Archæology' will appreciate what a blessing it is to have the cuts in the page. As for the text—596 pages in the translation—it gives evidence on every page of care and thoughtfulness. It is not encumbered with the ponderous notes often found in German books, and mere hypotheses and doubtful conjectures are everywhere rigidly ruled out. The subjects follow each other easily and with a natural association. It is good reading for the general reader, as well as a good book of reference for the classical instructor or student. For the latter, the exact references at the end to the originals of the illustrations will be particularly serviceable.

We have said that Reimer's idea was to treat of classical antiquity in a new way. This is indicated in the Varronian-sounding title itself—'Life of the Greeks and Romans.' Naturally enough, the book touches on ground already occupied by the various branches of philological study and treated of in other books. Thus there is plenty of antiquities in it, public and private—the latter covering in part the same ground as Becker's well-known books, 'Charikles' and 'Gallus'; but it is not a manual of antiquities; plenty of archæology, but it is not an archæology; plenty of references to art, without its being in any sense a history of art. The two great nations are taken up separately, about the same number of pages being allotted to each. First of all comes the architecture, beginning with the temple; then its fittings, as altars, enclosures, etc. Next, walls, gates, towers; buildings of utility, aqueducts, harbors, bridges, roads. From the dwelling-house of the Homeric *anax* we pass over to the historic dwelling-house, and, lastly, to man's final dwelling-place—the grave. Then come other buildings and places of a public character, such as the palaestra and gymnasium, the agora, the stoa, the hippodrome, and the theatre. All this part of the book, the architectural, was written by Guhl. The rest, which describes interiors and the multifarious occupations, amusements, and interests of man, fell in the apportionment to Koner. We can only name briefly some of the prominent things treated: seats, couches, drawers, and boxes; vases and vessels; torches and lamps; dress; female life; the education of the boy; music; gymnastic and agonistic exercises; armor; the ship; the meal; the dance; theatrical representations; the sacrifice; death and burial.

The life of the Romans follows substantially the same order. Points of resemblance between ancient and modern life are occasionally hinted at in brief terms. Thus, p. 158, of fire-baskets: "such fire-baskets on poles are still used by night-travellers in Southern Russia." P. 152: "Several small kotylai, with covers to them, were sometimes combined and carried with one handle, similar to what we find amongst peasants in Central Germany at the present day"; "the Roman soldier carried the same weight which the Prussian soldier formerly carried," etc., etc. There is one passage, by the way, worthy of quoting, since it shows that one of the most familiar inventions of modern times was not unknown to the Greeks:

"In later historic times the chief purposes of road-building were commercial traffic and festive processions. It is the worship of the gods which here again has given rise to art, and the holy ways were the first artistically constructed roads amongst the Greeks, connecting tribes and countries for the purpose of common celebration. Still, at the present time Greece is crossed by roads on which the grooves for wheels are hewn into the rocky ground. On these the holy vehicles, with the statues of the gods and the implements of worship, could be moved conveniently. Between these tracks the road was levelled by means of sand or pebbles. Where there were no two pairs of grooves, arrangements were made to avoid collisions" (p. 71).

The sense of the above passage is a little obscured by the punctuation and translation. The "still" in "still, at the present time" looks like an adversative particle; it is only a Germanism for "even at the present day" (*noch jetzt*). The last sentence, too, is badly translated: "Arrangements were made to avoid collisions." If we substitute for it "where there was not a double-track there were turnouts to avoid collisions," everybody will recognize the main features of the tramway or horse-railroad; and such a tramway is still to be seen in places between Athens and Eleusis.

Greek words in this book—both common nouns and proper—spelt in English letters generally conform to the fashionable spelling, which Grote's books and others have made familiar to the English reader. This is a matter of taste, and there is nothing to be said against it, but we must put in a modest plea for consistency. We find the Greek plural form "Dioskuroi" (for "Dioskouroi") and then "hoplomachi" and "Delphi." "Alpheios" is very well, "Alphaeos" clearly wrong. "Peiraieus" and "Polyneikes" and "Poseidon" preserve the Greek diphthongs, which are smothered in "Phidias" and "Klio." "Boeotia" and "Euboea" and "propylaea" are Latinized, while "Aischines" has the Greek form. "Aeschylos," "Mykenae," "palaestrai," and "paedotribai" are hybrids, neither Greek, Latin, nor English. "Phaiakai" is an odd enough blunder for "Phaiakes." Especially in cases where a word is clearly anglicized is it advisable to halt; "Korinthos" is of course admissible, as a Greek name; indeed, even if it were written "Qorinthos" we should yield to the authority of inscriptions and coins. But we see no earthly reason for spelling the English words "Korinth" and "Korinthian." Consistency in this case would lead us a long way; and we are not quite prepared to spell all the derivatives of "Korinth" with a *k*, as we should be obliged in that case to write "kurrants" and "kurrant-jelly." It should be said that Greek words printed in Greek type are remarkably free from errors.

*Eight Cousins: or, The Aunt-Hill.* By Louisa M. Alcott. (Boston: Roberts Bros. 1875.)—It is sometimes affirmed by the observant foreigner, on visiting these shores, and indeed by the venturesome native, when experience has given him the power of invidious comparison, that American children are without a certain charm usually possessed by the youngsters of the Old World. The little girls are apt to be pert and shrill, the little boys to be aggressive and knowing; both the girls and boys are accused of lacking, or of having lost, the sweet, shy bloom of ideal infancy. If this is so, the philosophic mind desires to know the reason of it, and when in the course of its enquiry the philosophic mind encounters the tales of Miss Alcott, we think it will feel a momentary impulse to cry Eureka! Miss Alcott is the novelist of children—the Thackeray, the Trollope, of the nursery and the school-room. She deals with the social questions of the child-world, and, like Thackeray and Trollope, she is a satirist. She is extremely clever, and, we believe, vastly popular with infant readers. In this, her latest volume, she gives us an account of a little girl named Rose, who has seven boisterous boy-cousins, several grotesque aunts, and a big burly uncle, an honest seaman, addicted to riding a tilt at the shams of life. He finds his little niece encompassed with a great many of these, and Miss Alcott's tale is chiefly devoted to relating how he plucked them successively away. We find it hard to describe our impression of it without appearing to do injustice to the author's motives. It is evidently written in very good faith, but it strikes us as a very ill-chosen sort of entertainment to set before children. It is unfortunate not only in its details, but in its general tone, in the constant ring of the style. The smart satirical tone is the last one in the world to be used in describing to children their elders and betters and the social mysteries that surround them. Miss Alcott seems to have a private understanding with the youngsters she depicts, at the expense of their pastors and masters; and her idea of friendliness to the infant generation seems to be, at the same time, to initiate them into the humorous view of them taken by their elders when the children are out of the room. In this last point Miss Alcott does not perhaps go so far as some of her fellow-chroniclers of the nursery (in whom the tendency may be called nothing less than depraved), but she goes too far, in our opinion, for childish simplicity or parental equanimity. All this is both poor entertainment and poor instruction. What children want

is the objective, as the philosophers say ; it is good for them to feel that the people and things around them that appeal to their respect are beautiful and powerful specimens of what they seem to be. Miss Alcott's heroine is evidently a very subjective little girl, and certainly her history will deepen the subjective tendency in the little girls who read it. She "observes in a pensive tone" that her health is considered bad. She charms her uncle by telling him, when he intimates that she may be vain, that "she don't think she is repulsive." She is sure, when she has left the room, that people are talking about her ; when her birthday arrives she "feels delicate about mentioning it." Her conversation is salted with the feminine humor of the period. When she falls from her horse, she announces that "her feelings are hurt, but her bones are all safe." She certainly reads the magazines, and perhaps even writes for them. Her uncle Alec, with his crusade against the conventionalities, is like a young lady's hero of the "Rochester" school astray in the nursery. When he comes to see his niece he descends from her room by the water-spout ; why not by a rope-ladder at once ? When her aunts give her medicine, he surreptitiously replaces the pills with pellets of brown-bread, and Miss Alcott winks at the juvenile reader at the thought of how the aunts are being humbugged. Very likely many children are overdosed ; but this is a poor matter to tell children stories about. When the little girl makes a long, pert, snubbing speech to one of her aunts, who has been enquiring into her studies, and this poor lady has been driven from the room, he is so tickled by what would be vulgarly called her "cheek" that he dances a polka with her in jubilation. This episode has quite spoiled, for our fancy, both the uncle and the niece. What have become of the "Rollo" books of our infancy and the delightful "Franconia" tales ? If they are out of print, we strongly urge that they be republished, as an antidote to this unhappy amalgam of the novel and the story-book. These charming tales had, relatively speaking, an almost Homeric simplicity and "objectivity." The aunts in "Rollo" were all wise and comfortable, and the nephews and nieces were never put under the necessity of teaching them their place. The child-world was not a world of questions, but of things, and though the things were common and accessible to all children, they seemed to have the glow of fairy-land upon them. But in 'Eight Cousins' there is no glow and no fairies ; it is all prose, and to our sense rather vulgar prose.

---

*The American Genealogist:* Being a Catalogue of Family Histories and Publications containing Genealogical Information issued in the United States, arranged chronologically by William H. Whitmore. Third edition, revised and continued. (Albany : Joel Munsell. 1875.)—Mr. Whitmore tells us in his preface that he has added more than sixty titles of works which should have appeared in the former edition (1868), and that he now names and reviews almost two hundred genealogies that have been published since 1867. We have gratified our own curiosity as to the progress of the passion for tracing family descent and relationships in this country in the following manner : In the last century Mr. Whitmore mentions but one formal genealogy (1771) and one tabular pedigree ; in the first decade of the present century (1810), 1 ; in the second (1820), 4 ; third, (1830), 5 ; fourth (1840), 15 ; fifth (1850, in which interval the New England Historic-Genealogical Society was formed and the publication of its quarterly *Register* begun), 66 ; sixth (1860), 177 ; seventh (1870), 248 ; eighth (to date), 111. Our count is a little rough, and it includes a few duplicates, but we may say with substantial accuracy that since 1840 the annual average issue of genealogical works of some kind or other has been, in successive decades to 1870 inclusive, six, seventeen, and twenty-four, and that it seems probable that the present decade will show no falling-off. Regard for one's ancestry can hardly go further than the publishing of two genealogies a month, or, to take account only of works worthy of the name, we may even say one a month. At this rate it must soon be difficult, for any one of New England descent at least, to follow up the several lines without coming upon a printed work in which some one of them is described by a previous explorer. Among the New England States, Rhode Island has been most backward in the pursuit of genealogy, and, outside of Puritandom, whatever has been done has been almost accidental. Pennsylvania was among the earliest, with its Sharples 'Family Record' (1816), but, with a great wealth of material, it has done almost nothing since. Virginia calls for similar remark on the part of Mr. Whitmore, who, in praising a memoir on the descendants of Pocahontas, says : "When our Southern friends abandon their claims to superiority in respect to pedigree, and give us facts relative to the early colonists, we are ready to welcome them and to view them with no unfavorable eye."

Mr. Whitmore cannot abide and does not spare a notoriously false pedigree (like that of *Lawrence*, p. 254), and he has constantly to rebuke the human weakness by which the makers of genealogies connect without evidence the American with some English line bearing the same name, and encourage the former to believe that they have a full right to use the coat-of-arms thus acquired. Elsewhere he has laid down the rule that "it is safest to assume that any given family here is *not* descended from any distinguished English family of the same name, now flourishing." Another and a more reprehensible folly grows out of the popular neglect of this rule, and that is the waste of time, energy, and money in the effort to secure English fortunes for the supposed American heirs. Columbus Smith, Esq., was kind enough in 1847–48 to make a search "in England for a property reported to belong to the Gibbses in U. S. A." He then acted as agent of the Acting Gibbs Association of Vermont ; and he has since performed the same service for the Jennings Association (1863), the Willoughby Association (1864), the Brown (!) Association (1864), and many others, down to the Gibson Association (1869), to whom Mr. Smith "reports that Mr. A. B. Herrick has not found any fortune yet, but if it is there he thinks he will find it."

One of the most curious of genealogical freaks is that mentioned on p. 236—the *Davis Family Record* (1868), a monthly journal "intended to be a mode of collecting and publishing information about all families of the name, especially those in this country." After eight numbers had appeared, the editor, a Connecticut Yankee, got his eyes opened to the immensity of his undertaking, and the journal came to an end. The Davises are, in fact, numerous enough to hold simultaneously half-a-dozen of the family gatherings which have now become so common among us. The earliest instance of this peculiarly American custom that we find recorded by Mr. Whitmore (of course only as it gave rise to some publication) is the meeting of the descendants of Richard Haven, of Lynn, at Framingham, Mass., August 29, 1844. Since then the Howes, Lymans, Breeds, Tuttles, Clapps, and we know not how many other tribes of great fecundity, have assembled and afterwards published their proceedings, or paved the way for a fresh crop of genealogies. One hears of no bad results from such promiscuous reunions, and certainly the idea is a pleasant one and eminently democratic.

Mr. Whitmore's work shares with Mr. Bartlett's 'Familiar Quotations' the distinction of having each new edition put in type *de novo*, instead of being printed from stereotype plates with emendations and addenda. We should have been glad to see reprinted here the original Introduction to the 'American Genealogist,' but that is readily accessible in the second edition. The compiler's likeness prefixed to the present volume is an admirable specimen of heliotype portraiture.

---

*Catalogue of the Public Library of Quincy, Mass.* [The longer notes are by Mr. Charles Francis Adams, jr.] (Boston. 1875. 8vo.)—The art of cataloguing is making rapid strides. The early catalogues of the library of Harvard College would not satisfy a modern circulating library. Its present catalogue is a marvel of learning and skill. Town libraries, too, are finding that a meagre list of authors is far from satisfying their needs, even if combined with an ordinary subject-index. Two years ago, the Boston Public Library, in its class-list of History, Biography, and Travel, showed what can be done in the way of encouraging, directing, and improving the popular taste for reading. Elaborate notes under many subjects of general interest, and copious references to works and parts of works treating of those subjects, made it easy for any one to pursue courses of study. The public were not merely guided in their reading but stimulated to it. Many a man must have longed to follow up the lines of investigation presented in that class-list who, if he had never seen the volume, would not have thought of touching the subjects, would have merely read at random, or taken refuge in fiction. A catalogue is rather disheartening to the reader. The common dictionary catalogue, especially, is a mere collection of fragments, unconnected and all alike. There is no light and shade, nothing to fix the attention. Admirable as a help to one who goes to the library knowing what he wants, it makes no special provision for the more numerous class who merely want something to read, most of whom, however, would prefer, if they knew how, to "improve their minds" and "increase their stock of knowledge." Where shall such men begin, and when they have begun what shall they read next ? In the Boston Public Library Catalogue, the notes catch the eye ; they are entertaining reading in themselves ; they promise a rich accession of learning to those who will follow their directions. Even indolent men will not always resist such offers. In June, 1874, the Superintendent's report showed that whereas in the previous six months the increase in the general circulation had been only 6½ per cent., the increase in circulation of historical works consequent upon printing this catalogue had been 134 per cent.

And now comes a better catalogue still. It is no discredit to Mr. Winsor to say so ; Mr. Adams has used his ideas and improved upon them ; the

next cataloguer may improve upon Mr. Adams. The general plan is the same; but the Quincy Catalogue has gained much room for important additions by omitting imprints. Indispensable for a college library, a historical or scientific library, or even a large popular library, imprints are nearly useless for a town library. In place of them the present catalogue inserts such brief but meaning notes as *Illustr.*, *Portraits*, *Fiction*, *Juv. Fict.*; or phrases explaining obscure or misleading titles, as "[Rebel View]" for Harrington's 'Inside: A Chronicle of Secession'; "[Journey to the South during the Rebellion]" for Lawrence's 'Border and Bastille'; "London Firemen," for Ballantine's 'Life in the Red Brigade.' So under Mary, Queen of Scots, we have Sainte-Beuve, C. A., 'English Portraits,' [Excusatory Sketch of Her Life]; Scott, Sir Walter, 'The Abbot' [Mary's Imprisonment at Lochleven Castle]—*Fict.*; Sterling, Elizabeth, 'Noble Deeds of Women' [Account of her Death]. There are many books whose titles are mere names, useless as a guide to their contents. Deficiencies of this kind are often supplied here, sometimes, perhaps, unnecessarily. Tables of contents, common now in all good catalogues, are given, and considerable "analysis"—that is, reference under subjects to topics discussed in certain books incidentally but not at sufficient length to justify the insertion of the book in the subject-list. But a new feature, at least for a town library, is the clue given to the valuable matter buried in periodical literature. There are nearly four thousand references to magazine articles, which is much the same to those who are looking up subjects as if four thousand volumes had been added to the library. The articles in our best periodicals are fully equal in ability and learning, and what is more, in readableness to our books; in fact, our books are in great measure republications of them; but they are ordinarily accessible only for desultory—that is, for the least valuable—reading. It may be doubted whether it was worth while, for such a library, to refer so much to the *Revue des Deux Mondes*, but the references to *Harper's Monthly*, *Lippincott's Magazine*, *Littell's Living Age*, *Popular Science Monthly*, etc., are of undoubted value. It used to be said that after 'Poole's Index' to periodical literature was published, the volumes of magazines wore out twice as fast. The binder of the Quincy Library will probably soon find the periodicals coming to him for repair in much greater number than ever before.

But the most important feature is the notes. Under "England: History" will be found thirty-six notes on single works, not merely calling attention to those best suited for popular reading, but warning off all but "scholars and antiquarians" from writers like Bede, Froissart, Hallam, Bacon, whose works, however interesting and able, are certainly not the best with which an uneducated person can *begin* the study of English history. The notes generally, however, praise rather than warn or condemn, and this, we take it, is the best course. Notes in such a catalogue should not be made for every book, but only for the best, otherwise they will not be read. Dull books, immoral books, should be left in obscurity. Under a few worthless works which have achieved an unmerited unpopularity a brief protest may be made; it will probably be ineffectual; but it can do no harm to call the Mühlbach novels untrustworthy and the Southworth novels inane. Besides the separate remarks under England, there is a "Note by the Trustees" of 180 lines of very fine type, in which various courses of reading for different periods of English history are pointed out; and under every important subject is a similar sketch of the literature. The next step in advance for catalogues will perhaps be to print these courses of reading not as notes but as text—that is to say, not in a type so small as to be read with difficulty, but in larger type than the titles, very much as literary histories are printed with bibliographical lists appended to each section.

The money that the catalogue cost might have bought 2,000 volumes, but it is plain that 7,000 volumes read as these will now be are worth twice 9,000 used in the unintelligent, aimless way in which many town libraries are necessarily used. Why cannot some of these libraries which have little money to spend in printing procure a few copies of this catalogue, mark those books which they have—which ought to be numerous, for this is a well-chosen collection—and publish the list of all their books not in the Quincy Library as a supplement? It is noteworthy that catalogues, unlike dictionaries and encyclopædias, grow better towards the end. In this one the notes begin in the second quarter. The first part of the history catalogue of the Boston Public Library was reprinted with very considerable additions and improvements, having luckily been burnt up in the Great Fire during the printing; and a careful reader can see a considerable change of plan in the catalogue of the Boston Athenæum in comparing the first hundred and the twelfth hundred pages. The explanation is simple. Librarians learn their art by practising it—a fact somewhat in favor of the much-talked-of but not likely to be established School for Cataloguers.

*A History of England*, for the Use of Schools. By M. E. Thalheimer, author of 'A Manual of Ancient History,' 'A Manual of Mediæval and Modern History,' etc. (Cincinnati: Wilson, Hinkle & Co. 12mo, pp. 287.)—We have already expressed so high an appreciation of Miss Thalheimer's histories that we need hardly do more now than say that this new one has in general the same excellences. In all of them the maps are good, and this is no exception, although we could wish those of Anglo-Saxon England and of Mediæval France a little larger and clearer. The illustrations are unusually good, being really designed to instruct and to cultivate the historical imagination. We should have liked, however, a larger proportion of genuine copies of ancient works (such as the Bayeux Tapestry), actual views (like that of Gibraltar, p. 212), and portraits. In connection with the title of Ethelred the Unready (p. 39), his "weak and inefficient policy" is mentioned, and he is spoken of as "never ready for action"; whereas the word really means "*rede*-less"—wanting in counsel. Macbeth (p. 46) is spoken of as a sheer usurper, while he appears to have been in fact of royal blood, and—before the establishment of fixed rules of succession—of about as good a title as Duncan himself. On page 29, Watling Street is given as the boundary between Alfred and Guthrun, which was the case only in the larger part of its course. In the account of Richard II., the student would hardly gather that he was, as Hallam says, of "arbitrary, dissembling, and revengeful temper." In the list of books recommended (p. 268) we cannot think the author especially judicious. Of course no list can include all desirable books, but the English volumes of 'Epochs of History' should by all means be included; for the purpose of this list we should include Stubbs's 'Constitutional History' rather than his 'Select Charters'; and Burton's 'History of Scotland,' Miss Yonge's 'Cameos from English History,' Palgrave's 'History of the Anglo-Saxons,' and Guizot's 'History of the English Revolution,' may well take the place of some that are given.

---

*Descriptive Anatomy of Typical Animals.* Prepared for the Guidance and Use of Students of Comparative Anatomy. By Henry S. Williams, Ph.D. (Yale). No. I. The Bones, Ligaments, and Muscles of the Domestic Cat. (New York: G. P. Putnam's Sons. 1875.)—Numerous as are the manuals of comparative anatomy of every size, there is hardly a book extant which a teacher can put into the hands of his pupils to be used in any other way than as a book of reference. When we saw some time ago the advertisement of Dr. Williams's forthcoming publication, we hoped it might be the beginning of a series that would prove of practical utility to the average student. But the sight of the work has doomed us to disappointment. Instead of what all instructors are crying for—a series of not too minute monographs of "typical animals," giving a guide to dissection, a descriptive anatomy, and an intelligent homological commentary all in one—such a series, in a word, as would result if a bony fish, a dog-fish, a fowl, a cat, a frog, and a turtle were successively treated after the manner of Mivart's 'Common Frog,' only with the anatomy more developed, we have here merely a heliotype reproduction of Strauss-Durckheim's outline plates, with Dr. Williams's translation into Latin of his explanatory index. Considering the peculiarities of his nomenclature, and the fact that every little groove and tuberosity on the skeleton and every smallest ligament are numbered and named, this last was no light task. But whether it was a desirable one seems to us doubtful. Such minuteness is most apt to disgust the beginner, while the real student of comparative anatomy is almost sure to be working under circumstances which yield him access to the original and complete monograph. Once more, any one who will give us a series of works intermediate between the present one and the useless and execrable 'Elementary Lessons in Anatomy' of Mivart, will be a benefactor.

BOOKS OF THE WEEK.

| *Authors.—Titles.* | *Publishers.—Prices.* | |
|---|---|---|
| Adams (C. F.), Address Delivered at Amherst, swd | (Hurd & Houghton) | $0 25 |
| Adams (C. K.), Demokratie und Monarchie in Frankreich, swd | (Stuttgart) | |
| Allibone (S. A.), Prose Quotations | (J. B. Lippincott & Co.) | |
| Alcott (Louisa M.), Eight Cousins | (Roberts Bros.) | 1 50 |
| Cary (Prof. H.), Dialogues of Plato. New and Literal Version | (Harper & Bros.) | |
| Cornell (Dr. W. M.), Handy Home Book | (Wm. F. Gill & Co.) | 0 75 |
| Daudet (A.), New Don Quixote | (Wm. F. Gill & Co.) | 0 75 |
| Edwards (Mrs. A.), Leah: a Woman of Fashion | (Sheldon & Co.) | |
| Faber (Rev. F. W.), Hymns | (E. P. Dutton & Co.) | 2 00 |
| Farquharson (Martha), Elsie's Womanhood | (Dodd & Mead) | |
| Healey: A Romance, swd | (Harper & Bros.) | 0 50 |
| Jones (C. H.), Abridgment of the Debates of Congress | (Henry Holt & Co.) | |
| Katsch (A. E.), Under the Stork's Nest | (J. B. Lippincott & Co.) | |
| Keary (Annie), Castle Daly. International Series | (Porter & Coates) | |
| Kenny (D. J.), Illustrated Cincinnati | (Robt. Clarke & Co.) | 1 50 |
| Littell's Living Age. Fifth Series. Vol. XI | (Littell & Gay) | |
| Lenormant (Madame), Madame Récamier and Her Friends | (Roberts Bros.) | 1 50 |
| Macbeth (J. W. V.), Might and Mirth of Literature | (Harper & Bros.) | |
| Rolfe (Wm. J.), Select Poems of Oliver Goldsmith, with Notes | (Harper & Bros.) | |
| Roe (Rev. E. P.), From Jest to Earnest | (Dodd & Mead) | |
| Stone (Prof. S. J.), Knight of Intercession, and other Poems | (Rivingtons) | |
| Spurgeon (Rev. C. H.), Lectures to My Students | (Sheldon & Co.) | |
| Sand (George), Flamarande | (F. W. Christern) | |
| Les Deux Frères, swd | (F. W. Christern) | |
| Travesty: Treasure Trove Series. Swd | (Wm. F. Gill & Co.) | 1 00 |
| Thomson (A.), Hand-Book of Scripture Geography | (G. P. Putnam's Sons) | 0 75 |
| Talmage (Rev. T. De W.), Daily Thoughts | (Dodd & Mead) | |
| Tyler (Prof. W. S.), Olynthiacs of Demosthenes | (John Allyn) | 1 50 |

# The Nation.

*NEW YORK, THURSDAY, OCTOBER 21, 1875.*

## The Week.

THE Republican majority in the Ohio election has at last been settled at a little less than 5,000, enough to make a victory, but not enough to remove all anxiety about the inflationist movement. That is to say, it is not enough to dishearten its supporters completely, and we shall probably have to fight them steadily in one place or another from now to 1879. Their doctrines are taking with the ignorant and unreflecting and embarrassed, and they will be supported by a good many persons who would be glad to see the whole greenback circulation, if not the whole public debt, repudiated, as one of the results of the war which it would be well to get out of sight; and, of course, if the process of inflation were once begun, the total disappearance of the greenbacks from circulation would probably follow within two sessions of Congress. Our present trouble with this matter—and it is a most serious trouble, for it makes the value of all existing debts a subject of contention at every political convention—is, as we have pointed out elsewhere, the direct result of Republican carelessness and double-dealing with regard to the currency, and, for our part, we are totally unable to see how the arduous process of returning to specie payments is to be accomplished under the direction of such men as are now dominant in the Republican ranks. We are inclined to believe that hard-money Democrats, if they now triumph in their own party, are more likely to be able to accomplish it, as they are likely to be more interested in the subject and to understand it better than the Republican statesmen, who take it up only because they see the country has lost its interest in "outrages." The gains of the election in Ohio are, that it has discredited inflation in the Democratic ranks as "a good card," and strengthened the hard-money wing led by Tilden, and has dragged the Republicans through the turn which the fierceness of the struggle gave the discussion into open instead of half-hearted advocacy of resumption. We shall probably not hear any more from those lion-hearted fellows, Messrs. Sherman and Morton, that the Resumption Act of this year does not mean either contraction or resumption, but simply "makes greenbacks as good as gold." The action of the Republican chiefs on this subject reminds one of the physicians who practise either allopathy or homœopathy as the patient pleases, so that anybody can have himself cured by likes or unlikes, big or little doses, as his fancy or his convictions may direct. Mr. Conkling opened the Republican canvass in this State on Monday by an earthquaking speech at Albany. Mr. Tilden must be amused by the preparations made to defeat him.

---

Any attempt to predict the result of the election in this city would probably be, as the newspapers say, "premature"; but a good deal will depend on the action of the workingmen, who are supposed by the Morrissey Democrats to be disaffected towards the Tammany ticket, owing to the reduction of wages by the departments. The Tammany nominations which have attracted most attention have been those for District-Attorney and Recorder. For these offices they have put up Messrs. P. B. Olney and F. A. Smythe, both good nominations, while, on the other hand, the Republicans and anti-Tammany or Morrissey Democrats have put up the present District-Attorney, Mr. Phelps, and also renominated the Recorder, Mr. Hackett, who has been Recorder for ten years, and is now vigorously denounced by Kelly for his connection with the Tweed Ring, which was certainly unfortunate, though there is no proof of corruption on his part. Mr. Phelps is, we believe, an efficient District-Attorney, and we have no doubt Mr. Olney would be too. The latter has the advantage of having for his partner Gen. F. C. Barlow, formerly Attorney-General of the State, and possessed of a great deal of varied information on the subject of crime and criminals in and out of politics, and a keen scent for fraud and peculation. Tammany has renominated all the judges except the Recorder, and for judicial offices the Republicans and Morrissey Democrats have also made good nominations, among others, Mr. Charles F. Sanford, a lawyer of reputation and character as well. The independent voter will, on the whole, "have a good time" this year, and if the tickets are well scratched and names transferred judiciously from one to the other, he will probably find that he is less troubled by the necessity of "choosing between two evils" than is usually the case in off-years.

---

General Butler delivered an address at the Cooper Institute last week on the financial question, in which he demanded that the Government, and nobody else, should "issue a dollar stamped on some convenient and cheap material of the least possible intrinsic value"—so that "neither its wear nor destruction would be any loss to the Government," and that "it would never be exported or desirable to carry out of the country"—and to form part of "an American system of finance," and never to be "redeemed" or "redeemable," any more than a yard-stick or a quart; "always to be quite equal to, or a little better than, the average gold dollar of the world," and "always keeping itself stable and fixed, so that when all the property of a country adjusts itself to it as a measure of value, it shall remain a fixed standard for ever." We speak advisedly when we say that this plan is now, and has been for nearly a century, familiar to all directors of lunatic asylums who have had much experience in the treatment of the insane of commercial communities. It has, in fact, since bank-notes came into general circulation, taken the place in insane hallucination once occupied by schemes for making gold out of baser metals, which descended as a tradition from the alchemists. Every distinguished chemist has had to deal with it in one form or another. We quote it simply because it has drawn forth leading articles from the principal city daily papers, and also from the *Financial and Commercial Chronicle*, which pronounces the scheme "more seductive, insidious, and dangerous" than those of inflationist orators usually are, and sets about refuting it. That a man generally regarded as *compos* should be able in a commercial city in America to collect a crowd to listen to his exposition of such a plan, and that financiers should have to ponder it and point out the fallacy of it, is, however, we confess, a serious matter, because it indicates a very marked step in return towards the mediæval state of mind. When a civilized people discusses the feasibility of making an everlasting measure of the value of goods out of a piece of paper or leather with a stamp on it, it shows that some of the remarkable phenomena of the eleventh century are still possible, and that the appearance of Miss Susan B. Anthony or some other female publicist in the air on a broomstick might any day be witnessed, as the old chronicles used to say, "by great numbers of people."

---

The precise status of the "rules" as to the civil service has been for some time past involved in a good deal of doubt, owing to the total silence of all concerned with their enforcement or interpretation. A case has just occurred which throws some light upon this obscure subject. The postmaster at Bridgeport, Connecticut, has recently been guilty of some irregularities in the way of selling appointments, and on the 9th of this month a note was sent him by the Postmaster-General, written with that unfailing courtesy which marks all the dealings of the Administration with the corrupt and

venal, reminding him that one Osborne had paid him one hundred and fifty dollars for securing his appointment as route-agent on the Housatonic Railroad, and that one Howe (or his friends) had paid fifty dollars, or thereabouts, for the place of mail-messenger between Bridgeport and East Bridgeport. The note then went on to recall to the recollection of Mr. Dunham that "the rule of this Department is invariable in this particular," and to suggest that "the necessity and propriety of this rule would doubtless be apparent" to Mr. Dunham. Owing to the existence of this rule, the Department felt compelled to believe that some fitter man might be found for the Bridgeport office, and to advise Mr. Dunham that "notice has this day been sent to Senator Ferry to name your successor." Mr. Dunham, or his friends, now begged that he might be allowed to resign "without anything being said about it," and the Department "reluctantly consented." Afterwards, however, Dunham withdrew his proposition. Meanwhile, Colonel J. W. Knowlton, chief clerk of the Department, was offered the place, but he, being a shrewd man, declined to accept it unless "the Republicans of Bridgeport" consented, because "if it should appear that he is not as satisfactory as any appointee would be to the Republicans of Bridgeport," he would prefer to decline. The "Republicans of Bridgeport" have, it seems, informed Colonel Knowlton of their consent, and he will take the place.

---

There has been a great deal of talk in the newspapers about Messrs. Moody and Sankey ever since their return from England, and there are signs of a widespread expectation that they will repeat in this country the exploits which made them justly famous in England. But although they have resumed their labors as revivalists, there is evidently little likelihood of their making any great or fruitful sensation here, and the reason is obvious. Their success in England was largely due to the fact that their mode of treating religious subjects was a complete novelty, and a marked contrast, in freshness and originality, to anything ever heard in the English pulpit of any denomination. Here, on the contrary, it is perfectly familiar to everybody who has ever attended a camp-meeting. Every church in this country contains a greater or less number of men who are capable of their kind of preaching—if not in the same degree of excellence, sufficiently near it to prevent their seeming markedly pre-eminent. It has to be taken into account, too, in attempting an explanation of their English triumphs, that there is just now a strong appetite in England for American oddities and novelties, and a strong disposition to admire them—a fashion, in short, somewhat resembling that which threw the Court at Versailles into ecstasies over Franklin's homely dress and plain, blunt manners. This accounts for the popularity which Joaquin Miller has enjoyed in the highest circles, and for the eagerness of the "thoughtful classes" in England to study the works of Walt Whitman. In short, the English mind is in a state of warm preparation for the arrival of strange things of all kinds from this side of the water, and we have no doubt that if, at the opening of the spring, a large body of American revivalists should go over and establish a religious camp near London, it would prove the most attractive resort of the season.

---

The Michigan Supreme Court has decided the liquor-tax law of that State to be constitutional. The principal objection made to the law was that a tax on the traffic in liquor was equivalent to a license of the traffic, and therefore in conflict with the provision of the State constitution prohibiting the legislature from passing any law "authorizing the grant of license for the sale of ardent spirits or other intoxicating liquors." There is now no prohibitory law in Michigan, the act which imposed the tax having repealed the previous law, which declared the traffic illegal. The question therefore was whether, in the absence of any legislative distinction between the liquor-trade and any other branch of business, the provision we have quoted made the taxation of the business illegal. The argument chiefly rested on the fallacy, which has a strong hold on a certain class of minds, that there is some connection between taxation and moral approval—*i.e.*, that the State when it taxes any business thereby signifies its intention to protect it, and so approves, countenances, and licenses it. Judge Cooley, in his opinion, however, shows the absurdity of this argument. No government, he says, ever acts on the theory that taxation and protection are coextensive. Some States derive their revenue mainly from real-estate taxes, but they do not on that account give any less protection to personal property; and, on the other side, taxation, instead of bringing protection with it, is frequently carried to a point of extinguishing a business altogether, as, for instance, a tax on imports so excessive as to amount to a prohibitory edict against those carrying on the business. A citizen is entitled to protection whether he is taxed or not, and, as everybody in this city knows, he must pay taxes whether he is protected or not.

---

The New York banks continue to ship Treasury notes to the South and West, to be used in the purchase of cotton and cereals, or, to use the stereotyped phrase, "to facilitate the movement of the crops." The last bank statement shows that nearly $4,000,000 were sent during the week, making a total of over $10,000,000 during the last two weeks. The effect on the bank reserves has been to reduce the surplus to $5,700,000. With the banks so near to the reserve line, the loan market has advanced about 1 per cent. for mercantile loans—that is, where rates were about 5 to 6 they are now 6 to 7 per cent. The feature of the week in Wall Street has been the rise in the price of gold and the high rates for which gold has lent, both having been caused entirely by the continued scarcity of gold here. The price has been advanced to 117, and borrowers of gold have paid ⅛ to ¼ for one day's use. These rates have unsettled foreign exchange, and it has sold at the lowest points of the year. Some gold has arrived here from Europe and California, about $2,500,000 in all; but much more is needed, and much more is expected. In London, by reason of the withdrawals of gold for Germany and New York, money has become more active, and the Bank of England, on Thursday, put its rate up to 3½ per cent.; it is still losing gold, and a further advance is expected. At the Stock Exchange, speculation has been dormant. General trade has been less active, and this season's business has culminated so far as manufactured goods are concerned, although much more will be done before the close of the year. Altogether, it has exceeded in volume that of any season since 1873; the profits have been moderate but satisfactory, and houses which were sound at the beginning of the season are in better condition now. Those which were unsound then have not found profits sufficiently good to recover solvency, and very likely there will be failures to fully the average amount, if not more, between now and the close of the year. The value of the greenback dollar has ranged from 85.47 to 85.83 (from 117 to 116½).

---

The English Admiralty have had to suspend the circular relative to the treatment of fugitive slaves by English men-of-war, which is simply a pitiful escape from a great blunder. They are now in another scrape nearly as bad, owing to the sentence of the court-martial in the enquiry touching the loss of the *Vanguard*. A number of subordinate officers of both the *Vanguard* and the *Iron Duke* have been dismissed or censured, but there appears to be no doubt that the admiral was responsible both for the order in which the ships were sailing and for the rate of speed, but took no steps to change either of them. Nobody on board the fleet seems to have been familiar with the proper mode of signalling in a fog, and, indeed, some doubt has been thrown over the question whether there is any such mode. The admiral, however, has escaped reprimand, and this has dissatisfied the public, which is more than dissatisfied by the revelations the enquiry has made of the state of discipline in the navy. The papers all have dismal articles about it, and say that the state of things is alarming. It ought to be said in explanation, however, that what people are troubled by is not

the personal qualities of the officers and men, but the want of familiarity with their duties. As regards bravery and obedience, the state of the navy, even as illustrated by the loss of the *Vanguard*, seems to be all that could be desired, but the drill in the details of the service seems far below the demands of the highly complicated pieces of mechanism which ships-of-war have now become. In other words, the officers and crew of the *Vanguard* were not ready for the emergency. They apparently knew how to die at their posts, but did not know how to save the ship. The press comments on this have been made all the more acrid by the fact that within a few weeks the First Lord of the Admiralty, Mr. Ward Hunt, has given a strong opinion in favor of patronage as against competitive examination in making appointments and promotions in the navy, on the ground that better securities for personal qualities could be obtained in that way. It now appears that the fleet is very well off as regards personal qualities, and that what is needed is technical training, or, in other words, the very thing competitive examinations would help to promote.

---

The difficulty between England and China, which, a few weeks ago, seemed likely to end in war, has been settled by the surrender of China on the 7th inst. It arose through the murder of Mr. Margary, a member of an exploring party sent out by the Indian Government to open up a new commercial route through the mountains between Burmah and China. The English Government insisted that the murderers, who had the assistance or countenance of the local officials, should be punished, and that the late treaties with Western powers, which have never been communicated to the Chinese people, should be published in the official gazette, so as to make known to them that foreigners travelling in the interior were not trespassers. The *Peking Gazette* contains all the memorials addressed to the throne, all the imperial edicts, and accounts of all court ceremonies, and is sent to the government of each province regularly, and read by the whole reading class of the empire. Not one word about the foreign treaties, or the reception of foreign ambassadors by the Emperor, has ever appeared in it. The Chinese hesitated long, and at last Mr. Wade, the British envoy, had to threaten to leave Peking. The cause of their hesitation seems to have been the fear of offending the Burmese, to whom the Margary expedition was disagreeable, and a desire to try their new military equipments, which include iron-clad ships, rifled cannon, and torpedoes. The *Economist* points out very sensibly the inexpediency of the Government's trying to open up commercial routes in strange countries, because the parties it sends out for the purpose, not being traders and having therefore neither an eye for business nor the stimulus of self-interest, are not likely to be good judges of commercial routes, and are not likely, in dealing with the people along the line of their march, to display a trader's tact and patience. The negotiations with the Chinese Government are said, however, to have brought out the pleasing fact that the commerce and intercourse which have been the result of the late treaties have really created a strong feeling of friendship for foreigners in the maritime provinces, and a strong dislike to quarrelling with them.

---

The *Economist* also gives an account of the condition of the English money market which shows that it is not very unlike our own. The London bankers are at their wits' ends to find means of employing the deposits in their hands, whether they are paying interest on them or not, so plentiful is the supply of money, and so strong the indisposition to use it. All first-class English securities are unprecedentedly high, so that the return they make to investors at present prices is very small. Foreign loans are completely discredited by recent revelations. The semi-barbarous borrowers, such as the South American Republics and Turkey and Egypt, can get no more money at any price, and there is even talk of a combination among the Great Powers to compel Turkey to provide fresh guarantees for the interest of what she already owes. The ordinary commercial bills dealt in by the bill-brokers are also, since the late failures, the objects of great caution and suspicion, and American railways are under a heavy cloud, owing to events with which we are all familiar. So that the British banker has probably never been so hard pressed to find the means of making any profit, and there is a general indisposition on the part of business men to undertake enterprises of any magnitude.

---

There are further signs of the split among Irish politicians which was foreshadowed by the row that attended the celebration of the O'Connell Centenary. The Lord Mayor of Dublin, who rejoices in the emphatically Gaelic name of MacSwiney, and who is one of the leading lay members of the Ultramontane clerical clique of which Cardinal Cullen is the head, has issued a programme for the formation of a new party, whose war-cry is to be "Faith and Fatherland"—which, in other words, is to be Catholic as well as patriotic, but above all Catholic. To anything of this kind the "Home-Rule" party, which contains a considerable intermixture of Protestants, and is secular in its aims and methods, and is largely if not entirely managed by laymen, is of course strongly opposed; and Mr. Sullivan, its principal representative in the House of Commons, writes a letter to the London *Times* strongly denouncing the scheme, and alleging that it finds no favor with the Catholic population, who will not consent to be severed in action or interest from their Protestant countrymen. The priests, or rather the bishops, who more distinctly represent Ultramontane aims, have long looked coldly on the Home-Rule movement, and would probably discountenance *any* movement in which ecclesiastical influence did not predominate and whose ends were not mainly ecclesiastical. They are occupied heart and soul just now in trying to get popular education in Ireland, university as well as school, completely into their hands, and they are naturally doubtful as to how far the success of a secular party with Protestants in it would help them in this work. But the split is generally regarded as a sign that the infusion of a spirit of rationality into Irish politics may not be far distant, and that the leading Irish party may at last be brought into working relations with Englishmen and Scotchmen, and the priests and the MacSwineys be reduced to that position of subordination and reticence in which the best interests of every modern state demand that they should be kept.

---

The French public has been a good deal cheered up by the success of the first call made on the reserves of the active army to come out for a month's training with the army in camp. This reserve comprises all young men, between the ages of twenty and twenty-nine, who have either served their term of five years in the army, or have been put on the lists as fit for service, though not actually enrolled under the conscription. The "réservistes," as they are called, have turned out in great force, have behaved well, and have in the field been scarcely distinguishable from the regular troops, and have been dismissed to their homes on account of the vintage eight days in advance of their time, with very flattering general orders from their commanding officers. Men of all classes served together in the ranks, and the best of feeling appears to have prevailed, to the great relief of the newspapers and the Conservatives, who appear to be surprised as well as gratified when any large body of Frenchmen do their duty and do not "rise" on anybody, or set up any new kind of political organization. But the sky is overcast by the announcement on the part of the Ministry, through M. Buffet, that it is going to support the system of voting by the *scrutin d'arrondissement* instead of the *scrutin de liste*, or, as we should say, of electing members for small districts instead of on a general department ticket. The object of this is of course to make the constituencies easier to manage by Government influence, and to give local notables a better chance. Which system would work better we doubt if anybody is as yet competent to judge, because nothing is really known with any accuracy about the temper or tendency of French constituencies under universal suffrage. Ever since 1848, when it was established, they have been under the rigid control of despotic authority in one shape or another.

## THE ESCAPE IN OHIO.

WE should be sorry to have it supposed that anything we may say about the late struggle in Ohio is intended in any way to belittle the services of those who, on the Republican side, have borne the brunt of the battle in defence of honesty and common-sense. Too much can hardly be said in praise of Mr. Schurz, Mr. Grosvenor, General Woodford, the Cincinnati *Commercial*, and others, who have during the last few weeks been engaged in stemming the tide of folly and knavery in that State. It must be admitted, too, that ever since the fight became really and plainly a fight between hard-money and inflation, the efforts of all those Ohio Republicans who have taken part in it have been such as to lay the whole country under heavy obligations to them, for assuredly there has been no State election for many years in which the whole country had so deep an interest. They have not simply beaten the inflationists in that one State, but they have forced the Republican managers in all the others into committing themselves fairly and unreservedly in favor of a return to specie payments.

The Republican party will probably hereafter appear everywhere as the champion of sound currency, simply because it has been proved in Ohio that the cause of sound currency is the popular and winning one. But, having made this admission, we must earnestly warn all friends of reform against the notion that the Republican party as an organization, such as it is and with its present leaders, is in any way entitled to the credit of the Ohio victory. On the contrary, to attribute to it any such credit would be a serious offence against the cause of honest government. So far from having by its principles or its management contributed to the result, it is fairly chargeable with the responsibility of the danger to which the business and good name of the country have been exposed at the hands of Allen and his associates. It has, in fact, prepared the way for the serious assaults on the public credit which we are now witnessing and are likely to witness, in three ways: first, by its dilatory, shuffling, and clumsy management of the finances during the first term of the present Administration, and its persistent refusal to treat them as a matter of prime importance; secondly, by its resolute and persistent refusal, during the second term of the Administration, when the financial situation had become perforce the main question of the day, to make it in any sense a party question, and demand adherence to a sound financial policy as a test of party fidelity; and, thirdly, by the retention in its leadership of persons who have no sincere convictions on any matter of importance now before the country, and whose leadership is, therefore, marked by the weakness and vacillation which are the usual sure concomitants of action which is not the result of conviction. The defence of the national credit cannot be conducted successfully by men who have no thorough acquaintance with the conditions on which it depends, whose history and training have attached them to a different class of subjects, and who, therefore, in a conflict like that now impending over the country, neither, as Cromwell said, "know what they are fighting for, nor love what they know." We have in a recent number of the *Nation* (534) endeavored to describe the way in which the party tried to shirk the currency question, and discourage its discussion, from General Grant's election in 1868 down to the panic of 1873. We need hardly remind our readers of the scenes in Washington which followed the panic. The President, after refusing to allow the reserve to be issued at the moment of panic, when it might have been of some use, issued it after the panic was over, thus giving direct and practical countenance to the inflationist theory that the remedy for our depression was an increase in the volume of the currency. When the subject, somewhat later, came up in Congress, the Republican party, far from taking a fixed and united stand upon it and producing a body of financial doctrine which might have been expounded to the country, and to which honest and intelligent men might have given in their adhesion, and through which the education of the popular mind could have been carried on, treated the currency as an open question, on which difference of opinion was allowable. Accordingly, we witnessed the extraordinary spectacle of the defence of inflation in its crudest shape by leading friends of the Administration and prominent managers of the party in both the House and Senate, to the great demoralization of public sentiment. Nor must it be forgotten that the germ of the inflationist theory and particularly of Kelley's 3.65 scheme is to be found in Mr. Boutwell's bold assertion, while in charge of the Treasury, that the Secretary ought to have the power of inflating or contracting the currency whenever, in his opinion, the needs of business required a change in its volume; in order, for example, to "move the crops" or "ease the market." This extraordinary doctrine, which this most prominent Republican financier did really put into practice, was never rebuked or discountenanced by the majority in Congress. It has proved in the hands of the Democrats a most fruitful suggestion, and the appearance of its worthy author in Ohio to combat it on the stump, reminds one of some incidents in the political history of the Grand-Duchy of Gerolstein.

So much with regard to the past relations of the Republican party to the currency. We recur to it because political morality is shaped and kept alive by party history. We are all interested in seeing to it that parties as well as individuals do not get credit which is not rightfully due to them, and do not profit by their own errors and shortcomings. We owe it to the moral sense of the community to prevent the assumption of the rôle of financial saviour by a party which has played fast and loose with the financial question, and encouraged or permitted all sorts of financial abuses and vagaries within its ranks when that question was completely within its control. To allow it, would be to release politicians from the necessity of having either principles or policy on any of the leading topics of the day, and make party responsibility the merest sham. There is, however, another and even stronger reason for not letting the Republican party use the honors and rewards of any recent or prospective triumphs of honest finance as a means of giving it the position of a reform party, and that is the absence among its leading politicians of any positive ideas or convictions on the problems now pressing for solution. They are incapable of conducting any reform movement for want of any interest or faith in the objects of reform. They are mostly what, for want of a better name, we shall call "horse-politicians"—that is, they are in their relations to the people on almost exactly the same moral plane as the horse in his relations to his owner. To the horse when put into the wagon, it is a matter of complete ethical indifference whether he carries his master to a gambling-house or to church. To him one place of resort is just as desirable as the other, and he is equally willing to go to either. So, also, a Republican statesman in our time is very apt to confine his statesmanship to "finding out what the people want," and, whatever it be, he is ready "to go in" for it. If they want, or he thinks they want, the South governed by martial law, he supports martial law; if they want, or he thinks they want, the South let alone, he preaches State rights; if they want, or he thinks they want, inflation, he roars for fresh issues of paper money; if they want, or he thinks they want, specie payments, he denounces inflation as sinful and idiotic—with no more shame than a horse would feel in waiting for his master in front of a faro-bank. Upon none of these subjects has he any opinion of his own to which he attaches the least value. If, on the other hand, he should find himself mistaken as to what the people want, he will face right about within a week with as much nonchalance as the horse would show in trotting towards the gambling-house if his master turned him sharply off from the road to the church.

We might fill a pamphlet with illustrations of what we mean from recent political history, without using such gross cases as Senator Morton's tergiversations about the currency. We will, for want of space, content ourselves with one only, that of Mr. Dawes, who is now one of the leading party chiefs and Senator from the eminently Republican State of Massachusetts. There was perhaps no more flagrant departure from the spirit of civil-service reform than General Grant's handing the party patronage in that State over to Butler in the Simmons affair last year. There is perhaps no more notoriously corrupt and corrupting poli-

tician than Butler. Well, when a determined effort was made by respectable Massachusetts citizens to oppose the Simmons appointment and protest against Butler's influence at the White House, Mr. Dawes carefully withdrew from Washington and declined to meddle in the controversy. When the State election came, he went home and stumped for the party, on the ground that the whole of the negroes at the South ran every day and night the risk of being murdered; and, by way of showing that he did not seriously object to the Butler element in politics, he went into Butler's district and stumped for Butler's re-election to Congress. As soon as, however, the voters showed by the election that they did not believe his stories about the condition of the South, and did not approve of Butler as a party man, he dismissed the slaughtering of the negroes from his mind, became to all outward appearances indifferent to their sufferings, and this year turned up at the Massachusetts Convention as the reporter and we believe the drafter of the following resolution, which he read aloud himself with much solemnity and emphasis:

"That reform in the civil service is a work which no party can give over or slacken, and for the elevation and purification of that service the Republican party will continually and faithfully strive, welcoming the co-operation of their opponents in whatever quarter it may appear, to the end that every corrupt and unworthy office-holder, without distinction of party, may be driven from his place, and that official malfeasance may be hunted and punished wherever the pursuit may lead or the blow fall."

He here denounces Butler and his work and ways and influence as heartily as if he had not one year ago urgently recommended a Massachusetts constituency to re-elect him. In another resolution, too, which we have not space to print, he warmly advocated the right of all the States to manage their own affairs without Federal interference, having abandoned the doctrine he held last year that such gross interference as had been practised in Louisiana and Mississippi was, if not justifiable, excusable. Now, we would ask all those who really believe that reform in administration, and especially in the finances of the Government, is the crying need of the day and the problem with which the American people are now called upon to deal, whether they seriously expect that the work can be done by a party managed and led by such men as now have the Republican party in charge—Morton, Logan, Conkling, Boutwell, Dawes, Cameron, Butler, for instance—men who have no positive convictions on any of the questions now ripe for solution, and hardly any personal preference for one line of policy more than another, or even any familiar acquaintance with the subjects in which the materials for the solution are to be found? We must remember that parties competent to take hold of the Government and carry it on successfully, and provide the legislation the times call for, have always been parties led by men who, rightly or wrongly, held firmly and bravely and clearly certain ideas on public policy, and had held them before the party was formed on them, and would hold them if the party were to abandon them to-morrow. It was in this way the Republican party was led in the days of its greatness. It triumphed because it followed and was managed by men who knew what they sought, and sought it eagerly, and who would not be refused though all the world gainsaid them—whose opinions on the great questions of the day were the same one year as another. It would never have carried on the war or abolished slavery if its chiefs had been a parcel of adventurers to whom all views came alike, and for whom no views had any more interest than the dice with which he wins his money have to the gambler.

## THE RISING AGAINST THE NEW BOSS.

As usual for some years past, the fall canvass in this city is to be a three-sided one, there being in the field not only a Democratic ticket and a Republican ticket, but an anti-Tammany ticket also. Exactly what the anti-Tammany party's political programme is, no one knows, pretty much the only information vouchsafed us on that subject thus far having been the hoisting of a large transparency in front of one of the headquarters with the bold legend, "No More One-Man Power; Let The People Rule." It is not only the anti-Tammany Democrats, however, who call upon their fellow-citizens to unite with them in putting down despotism and restoring the "people" to their rights, but a large and influential portion of what we may call the reformatory press—that is, the press which is generally on the side of good government, opposed to the wiles and machinations of "bosses," and which always devotes a good deal of its time as well as space to the task of exhorting the impenitent citizen to rouse himself from the slough in which he is sunk and take part in the "primaries," and see to it that "none but good men" be nominated, and reminding him that the office should "seek the man, not the man the office." At the first blush, it might seem curious that the anti-Tammany Democrats, the leaders of whom are a rather unsavory set, should support gratuitous advice given them from such a quarter, but they have; and some very good nominations have been made by them and the Republicans united, and they will no doubt succeed in getting a good many thousand votes from the educated, reputable, and property-holding classes in the next election. That is to say—judging by those indications in the way of newspaper support which seldom fail in New York, however unreliable Washington politicians find them—the "good citizen" will turn out in considerable numbers to vote against the Tammany ticket.

Against this we have not a word to say. The condition of parties in this city is such that the best chance we have of good government is a balance of power sufficiently close to force all the factions to bring out their best men, and we believe that the necessity of doing this is so thoroughly recognized by all of them in most cases that the good citizen will be able this year to make up a composite ticket out of the three which will contain, for all important offices, excellent names—a state of things which would have been utterly impossible a few years since, in the days of Tweed and "Jimmy" O'Brien. When we come, however, to examine the arguments which are advanced to convince the good citizen that he ought to vote the united Republican and anti-Tammany tickets, we must confess to being somewhat amused at finding them consist almost altogether of the danger to the liberties of the people from the usurpations and tyranny of one John Kelly. This John Kelly, it seems, having succeeded to the power formerly wielded by Tweed, has absolute control of Tammany Hall through that of the Democratic party, and through that has gradually absorbed the entire government of the city. He is the "one man" who is so dreaded by his enemies, so respected by his followers; the "boss" whose careful drill makes the machinery of elections work so perfectly; who declines to "let the people rule," because he wants to do all the ruling himself. According to the *Times*, "the local contest over the judiciary this fall really turns on the question of whether the judges in this city are to be the creatures of John Kelly"; and, again, "The Kelly despotism, like that of Tweed, on which it is modelled, needs three things to make it complete—control of local administration, control of a section at least of the judiciary, and control of the officers charged with the detection and prosecution of crime," and the *Times* proceeds to show that Kelly has "nearly gained the first point already"; that he has just "put in nomination half a dozen more" judges; and that he is engaged with his "lieutenant," the Mayor, in getting possession of the police force. Finally, it urges the people to vote against Mr. Olney, the Tammany candidate for District Attorney, because he "owes his nomination to John Kelly," and that objection "ought to be fatal." The language used on the subject by the other anti-Kelly papers would be quite appropriate if John were a foreign invader instead of being a naturalized American citizen of "respectable antecedents," who is not even an office-holder, but simply a gentleman of leisure who devotes his time to "attending to his political duties."

Kelly is indeed the very type of the good citizen whom political exhorters in and out of the press are always calling upon us to follow and imitate. He is, to be sure, of foreign extraction, but for all that he has never neglected to go to the "primaries" whenever they have been called, and always urges his friends to go with him; and we venture to assert that he has never, since he became entitled

to exercise the right of suffrage, failed to deposit his ballot on the day of election. He is, moreover, a firm believer in our institutions, and probably in his life has never been heard to utter a sneer on the subject of universal suffrage or the majority rule or municipal self-government. More than this, he has always taken a deep interest in the government of his country, and his motives (which we know from the same source that we know those of General Grant —the statements of his friends about them) are the improvement of the city of which he is an inhabitant and the general welfare of his fellow-men. That is the reason why he gets as much power as he can, why he nominates a judge here and decapitates one there, or, to put it as he no doubt would, why he "attends conventions and endeavors to persuade his fellow-citizens that Judge Stealem ought to be succeeded by a fitter man." Charges have no doubt been made against him, but, then, who escapes calumny in these times? He is a plain, straightforward man of the people, and if he has obtained all the power the *Times* says he has, it is through gaining influence with the people by "moving among them," by "mixing with their affairs," by knowing them personally and studying what they want, and not by holding himself aloof from them like a cold-blooded aristocrat or "scholar" or "doctrinaire" or "theorist." And now the doctrinaires and theorists come down upon him and denounce him as a "usurper" for doing all his life what they have all their lives been advising him to do.

The fact is that there is no very great mystery about the power either of Tammany Hall or of the "boss" who for the time being "runs" it, and it is on this account that we can hardly be expected to feel much enthusiasm at the prospect of a rising against the present one. Within the memory of the present generation of men in New York there has always been a "boss," and at periodical intervals there has been a "rising" against him. Formerly it was Fernando Wood; then it was Tweed; now it is Kelly. Moreover, there are certain facts which tend always to the production of "bosses" in this city. New York is Democratic and very wealthy, and is managed through machinery which is very intricate and difficult to get the run of. This machine must be managed by a set of men who devote a very large part of their time to it, and as politics is not an attractive profession to people of wealth and intelligence in this country, these men will be in the main poor men who are "after" money. Honestly or dishonestly, Wood, Tweed, and Kelly get rich out of the city treasury, and then, being men of property, they use it to advance their friends and punish their enemies. This process goes on for some time without attracting much attention, until the "boss" has made a good many enemies, when he in turn is denounced as a "usurper" and "tyrant" by the Jimmy O'Brien or Morrissey of the period, and with the aid of good citizens and the press he is "hurled from power" into ignominy and oblivion—or Congress. It is necessary, however, for the reformers and exhorters who wish to hurl the Boss from power to remember that it is a process which must not be repeated too frequently. In former times, the practice used to be to allow the memory of the last rising to die out before a new one was begun. New York is the home of two very different classes of people, being partly made up of young men—from all parts of the country, or born in New York itself—who do not know much about "politics," but have some ideas about decency and good government, and are consequently troubled at the things they see about them; and also of "old New Yorkers," who have lived long enough in the city to understand it, have little or nothing to do with politics, knowing them to be "rotten to the core," are utterly sceptical and cynical about reform, and very willingly confess in conversation that they think the whole thing is a "sham," and some of whom used now and then to volunteer the suggestion that "what we need is a strong government," and remind one another of Louis Napoleon and Paris with regret. By-and-by the younger generation grows up, and, having made money in its turn, sees the matter in the same way, and makes room for another generation of new New Yorkers. Now, when a "Boss" is to be risen against we must have the aid mainly of this younger, dissatisfied class, and as long as we have about one rising in every fifteen years there is no difficulty. The young and enthusiastic can always be persuaded once in their lives that if they will only rise and hurl a "Boss" from power, all will be well—that there will be no more fraud or peculation, no more interference with the independence of the judiciary, no more Tammany Hall. But when they have seen it done once, and yet are made painfully aware that Tammany has not been swept away, nor is the judiciary independent, nor has corruption disappeared, but another "Boss" has come in to take the place of the old one, they cannot in reason be expected to "rise" immediately again. No community has the journalistic capacity for continuous indignation at things it cannot alter, and so, instead of rising as we would have them, they remain perfectly quiet. Rising against Bosses is really such a necessary and valuable last resort in New York that we should be sorry to see the practice fall into contempt through familiarity with it. There is, on the whole, very little danger that the people of New York will allow themselves to be persuaded into believing that the wild election nightmares invented by the press have any real existence. On the other hand, and it must not be forgotten either, if the people have made up their minds to "rise" against John Kelly, rise they undoubtedly will and "hurl" him into the abyss.

## THE HIGHER EDUCATION IN SCOTLAND.

London, September 25, 1875.

I HAVE been interesting myself during my too short stay in Scotland in the system of education carried out in that country. The parochial system, which prevailed in Scotland from the time of John Knox till the year 1872—or for nearly two centuries—is so well-known both in America and on the Continent that I need not describe it to you, except in the merest outline. The theory of the Scotch Reformer was that in every parish in Scotland a good elementary school should be established in close connection with the parochial church, the minister of which should superintend the education of the children, while the land-owners in the parish should bear the expense of the school. In each important town in Scotland he desired to see high-schools or grammar-schools in operation, in which the secondary education of the more promising boys from the parochial schools should be conducted; and in two or three of the largest towns universities were to exist, in which ministers, lawyers, and doctors, and the eldest sons of country gentlemen, should be educated in the higher branches of learning. Even before the time of John Knox the necessity of education was fully recognized by the inhabitants of stern Caledonia. As early as the year 1494, it was enacted by "The Estates" that throughout the realm of Scotland all barons and freeholders "that are of substance should put their eldest sons and heirs to the schools fra they be six or nine years of age, and to remain at the grammar-schools until they be competently founded and have perfect Latin, and thereafter to remain three years at the schools of art and jure (law), so that they have knowledge and understanding of the laws; . . . . and what baron or freeholder of substance that holds not his son at the schools, having no lawful excuse, he shall pay to the king a sum of twenty pounds." It is strange to read this old statute, and to see how that astuteness which is still so characteristic of the Scottish race enabled them, nearly four hundred years ago, to recognize the paramount necessity of an enlightened education, and the importance, in those feudal times, of the hereditary lawgiver in each family having "knowledge and understanding of the laws." To this spirit may, perhaps, be traced the law-abiding character of the people which prevails to the present day.

But this old statute, which I unearthed from a blue-book the other day, and the reflections which it suggests, must not be allowed to carry me off my subject. The system contemplated by John Knox was instituted by Act of Parliament and carried out, but only in part. Schools were founded in every parish, and universities were established in the four towns of Aberdeen, Edinburgh, St. Andrews, and Glasgow, situated in the north, south, east, and west of Scotland respectively. But the middle portion of John Knox's programme was never accomplished. What he would have called grammar, and we should call secondary, schools have never found a place in the educational economy of Scotland. In each town in the kingdom a burgh school has been in operation from a very early period, but these schools are not secondary schools. In the larger towns they have become small universities, with separate faculties or departments and independent masterships (each master being a little pope in his own department), but without the power of conferring degrees; and in the smaller towns they have degenerated into mere elementary or parochial

schools, situated in towns and not in country parishes. The effect of this, as I understand it, has been prejudicial both to secondary and to superior instruction. The parish schools have attempted to do the work of secondary schools instead of attending to their own work as elementary schools, and the universities have come down from their natural position as the promoters of superior education to do all the work of secondary schools which the parochial schools are unable to accomplish. In the parochial schools you will see big boys and girls reading Greek, Latin, French, and German, along with little boys and girls learning their English alphabet, and in the Greek and Latin classes of the universities you have scholars far advanced in classics working alongside of others who hardly know the elements of classics, and who, in any other country, would be found in grammar or secondary schools. In these circumstances it is impossible to look for a high type of education in Scotland. You have—thanks to the parochial schools—the elements of an English education more widely diffused in Scotland than in almost any other country in the world, except perhaps America. But the secondary education of the country is of a humbler type, and superior education can hardly be said to have any existence. Scotch boys who are desirous of procuring an education of a superior kind must go to England for it. The refinements of classical education, such as are the staple of the education given at the universities of Oxford and Cambridge, are unknown north of the Tweed. The professors in the Scotch universities are men of the same mental calibre as those in the English universities, and most of the best-known among them were, in their day, distinguished members of the English universities. The raw material of the Scotch student is probably superior to that of the English student, certainly it is not inferior. But the school training of the English boy is what the Scotch boy wants. There are no schools such as Eton, or Harrow, or Rugby, or Winchester, in Scotland. There are no grammar-schools which can be compared with those of Clifton, or Uppingham, or Marlborough, or a dozen others which might be named. The best of the Scotch youth are drafted off each year to the English schools, and educated in them, and from these schools they proceed, like their English school-fellows, to the English universities.

The question which at present is occupying the minds of Scotch educational reformers is how they can improve their secondary schools. Three years ago, an important measure was passed by Parliament for the improvement of Scotch education. In some respects, even the first part of John Knox's programme had become obsolete. He contemplated that one school in each parish would be sufficient to meet the requirements of the parish; and he did not contemplate that the Established Church of Scotland would be split up into two hostile parties of nearly equal numerical strength, and that a Free-Church minister would be settled down in every parish of Scotland in opposition to the Established-Church minister, prepared to resist his authority over the education of the parish, and to establish a school of his own. It was to meet these two omissions in John Knox's educational scheme, and to make provision for certain contingencies which an experience of two hundred years suggested, that an Education Act was necessary. Many efforts during the last quarter of a century were made to carry some comprehensive measure through Parliament which would satisfy the people of Scotland. But, up to 1872, the power of the clergy of the Established Church was too strong for the reformers. In that year, however, the Act which now regulates the education of the country was carried. The object of that Act was to establish schools throughout the country wherever they were wanted, and these schools were to be managed by school-boards elected in each parish and burgh by the ratepayers. They were to be supported by rates, imperial grants, and fees, and in them religion was neither to be prescribed nor proscribed, but the question of teaching it or leaving it alone was left in each case to the determination of the school-board. By these enactments the land-owners were relieved from the burden of supporting the schools at their exclusive cost, and the clergy were relieved, much to their dismay, of the burden of superintending the education of the children. The clergy of all denominations are eligible as members of the school-boards if they gain the suffrages of the ratepayers. But no clergyman is *ex-officio* a school manager as of old. So far as elementary education goes, the Act is working well, but it makes no provision for secondary education. The old parochial schools being practically at an end, they can do but little for the higher branches of education. Under the name of board-schools, they have to attend to their own province, that, namely, of elementary education. At present, therefore, the secondary education of the country is carried on by the universities, by a few private schools or academies, and by one or two grammar-schools in the larger towns. The universities are, to some extent, degraded by this arrangement, and the authorities in these institutions are as desirous as the public of improving on it. The education given in private schools or academies is never first-rate, the proprietors of such institutions being generally driven by the exigencies of fortune to the necessity of underpaying the teachers and overcharging the pupils. And one or two grammar-schools, even if they had a fair field and were not undersold by the universities, cannot supply an adequate education to a considerable country like Scotland. The establishment, therefore, of a good system of secondary education in Scotland is the question of the future. Elementary education of a high type is supplied by the operation of the statute of 1872. University education, if not of a high certainly of a wholesome type, is also supplied partly by ancient endowments, partly by state aid; but no kind of provision is made for secondary education. All the materials for a good system exist in the rough except one, and that one is the not unimportant one of funds. There are twelve public schools—*i.e.*, schools under the management of school-boards—which call themselves higher-class public schools, and these twelve schools possess among them an annual revenue of some £22,500, five-sixths of which is derived from fees alone. It may therefore be said without exaggeration that there is no pecuniary provision whatever for secondary education, and the problem which educational reformers are endeavoring to solve is this: From what sources can funds be provided for this object?

There are three possible sources—Parliamentary grants, ancient endowments, and private subscriptions. Parliament has not been asked directly to sanction grants in aid. But the improbability of the House of Commons, in its most generous moments, sanctioning the expenditure of public money on schools which are principally used by those whose parents are able to pay, is so great that no legislator has yet been found bold enough to make the experiment. That source, in the present state of public opinion, may be looked upon as dried up. Ancient endowments exist in Scotland to the extent of some £200,000 a year, and if the trustees could see their way to depart to some extent from the expressed intentions of the testators, the secondary schools of Scotland might be placed on the best possible footing. But the trustees are for the most part men who are loath to part with their trusteeship. In not a few instances also they are men who think it more important to keep down the elementary school-rates by means of these ancient endowments than to encourage secondary education, and Parliament is reluctant to apply excessive pressure to them. Interference with corporation property may lead to interference with private property, and Parliament is not prepared to commence what might end in a socialistic war. Educational reformers therefore fall back upon the third possibility, and are beginning to think of organizing societies for the better endowment of the secondary schools of Scotland. The object is excellent, but the difficulties are considerable. People will subscribe sums of money when either their political or their ecclesiastical feelings are excited. But will they do so merely for an academical project? I wish these public-spirited gentlemen across the border all success in their enterprise, and I shall watch its progress with the edeepst interest.

# Notes.

GENERAL SHERMAN'S 'Memoirs' is to have what is ironically announced as a "companion volume," prepared by Gen. H. V. Boynton, the Washington correspondent of the Cincinnati *Gazette*. It will be called 'The Memoirs in the Light of the Record: a Review based upon Compilations from the Files of the War-Office,' and will be published by Wilstach, Baldwin & Co. Gen. Boynton, whose reputation for accuracy and probity stands very high, condemns Gen. Sherman's work as "intensely egotistical, unreliable, and cruelly unjust to nearly all his distinguished associates."——Gen. O. O. Howard is to contribute in three papers to the *Atlantic Monthly* his recollections of three of the most famous battles of the war.——A prettily illustrated hand-book for tourists, called the 'Railroad Scenery of Pennsylvania,' has been issued by J. B. Lippincott & Co. There are views along all the famous rivers of the eastern half of the State, and characteristic scenes from the coal regions.——'Kenny's Illustrated Cincinnati' (Robert Clarke & Co.) is a more considerable work than the preceding, and fully justifies its title. It contains an excellent map of the city and a great deal of useful information. But we have seldom been more amused by any "art-criticism" than by that contained in the following extract from Mr. Kenny's description of the Tyler-Davidson fountain: "The central figure [of the eastern half of the upper basin] from this point of view is a mother, semi-nude, leading her half-reluctant child to the bath. The full bust is exposed as plainly as in the well-known Magdalene of the

great Italian master, *the chromos of which are seen in almost every window, but* the countenance and whole aspect are purely Teutonic. She might have indeed been the very Thusnelda whose love for Hermann, the great conqueror of Varro [*sic*] and his legions, has passed alike into history and into song."——Dietrich Reimer, Berlin, sends us No. 8 of H. Kiepert's Physical Wall-maps for the use of schools. It is in eight sheets, and represents the Pacific Ocean with its countless islands (including Australia), and so much of the continents that bound it as lies between Calcutta, on the one hand, and Buenos Ayres and Porto Rico on the other. Its great currents are distinguished by appropriate coloring, as are also the various European possessions. The compass of this map is very unusual, and its execution is at once delicate and clear.——From B. Westermann & Co. we have Part 13 of Spruner's 'Historical Hand-Atlas,' devoted wholly to Germany, the first two maps dealing with those intricate territorial divisions called *Gaue;* the other two showing Germany (1) at the time of the Reformation, 1492 to 1618—admirably colored; and (2) at the time of the Thirty Years' War, 1618–1648. There are also numerous side-maps, one giving the division into ten *Kreise* (1512), and others the plans of the chief battles of the Thirty Years' War, etc.——Sanders, the lexicographer *par excellence* of the German language, has just published an alphabetical list of those German words, native and naturalized, the spelling of which is difficult or disputed. This work and, much more, the same author's 'Vorschläge,' which contains general principles and rules of special application to the German language, will have an interest not only for a few advanced students of German, but also in some degree for persons who, like the commission recently instituted by the Connecticut Legislature, have to do with English orthography. Dr. Sanders is conservative, aims at what he *can* get rather than what he would like to get, and prefers retaining one out of several authorized spellings of a word to making violent innovations.——Mr. Fred. W. Foster is now contributing to the English periodical, *Notes and Queries*, an interesting bibliographical list of works on sword-play.——The November number of the *International Review* will contain a personal sketch of Professor Ernst Curtius, by Robert P. Keep, Ph.D., accompanying a first contribution to the *Review* by Professor Curtius himself, who has undertaken to keep its readers *au courant* with the excavations at Olympia, which he, by appointment of the German Government, directs.

—A special report (8vo, 105 pp.) on labor in America has been issued by Mr. Edward Young, of the Washington Bureau of Statistics. A slight examination suffices to prove the brave show of figures to be a sham very discreditable to the Government. We take a few samples from a single page (64) of the report. The price of "superfine wheat flour" in North Carolina is given for the three years 1867, 1869, and 1874, as, respectively, $10 72, $9 50, $6 50. In South Carolina, the corresponding entries are $13 25, $9 62, $9 00. It is evident at the first glance that these entries are blunders, or else that different qualities of flour are reported, which would make the comparison highly deceptive. The statement that the same quality of flour was, in South Carolina, higher by $2 53 in 1867 and by $2 50 in 1874 than in North Carolina, is absurd enough; but, taken in connection with the statement that it was only twelve cents dearer in 1869, it is sufficient to destroy the credit of the entire report. But there is much more of this kind. Thus, the same article of flour is reported at $6 61 for 1869 and $6 59 for 1874 in Virginia, while in North Carolina it was $9 50 in 1869 and $6 50 in 1874, a falling-off in one State of two cents per barrel, and in the other of three dollars! Again, while this article was $9 95 in Virginia in 1867 and $10 72 in North Carolina, it was $9 50 in North Carolina in 1869 and only $6 61 in Virginia. These are a part of the absurdities which might be extracted from a single line (the first) of this page, in which the figures for flour are given for three States. So far as we have examined the reports of this article for the remaining thirty-four States, on the pages following and preceding, the same hopeless disorder prevails throughout. We take a few other instances, still from page 64: Codfish, dry, is reported at 17 cents per pound in South Carolina for 1869, and 6 cents for 1874. Carry the news to Gloucester! Brown sheetings, 9-8 wide, of standard quality, while sold at 24 cents per yard in Virginia in 1874, were to be had in North Carolina at the same time for 10¾ cents. The same goods, bleached, were 25⅔ cents in Virginia and 11¼ cents in North Carolina. New Orleans molasses, which sold for $1 01 per gallon in 1869 in Virginia, and for only 90 cents in 1874, rose during the same period in South Carolina from $1 22 to $1 25. Coal-oil in 1874 was 33 cents per gallon in Virginia; 41⅔ cents in North Carolina; and 20 cents in South Carolina. We might take several score of similar blunders from this single page, but the above will perhaps serve to show what quality of work our Government is issuing in this line.

—'A Chart of General Literature,' by E. J. Trimble, instructor in literature in Swarthmore College, Pa., has been published by J. M. Stoddart & Co., Philadelphia. As mounted for the wall, it offers too long a tract for even a near *coup-d'œil*, and it might better, we should say, have been divided into two or three. Longitudinal lines represent centuries and decimal parts of centuries, while horizontal lines under each recorded name show the date of birth and death sufficiently well. Horizontal divisions classify the names into poets, dramatists, etc. As this does not provide for the case of an author whose genius manifests itself in more than one direction, an alphabetical index is given, with dates and specific though abbreviated characterizations. It must still seem strange, however, to find Emerson set down in the chart as a philosopher only and not as a poet; and even Shakspere appears restricted among the dramatists. The American and English portions are naturally fullest among the modern ones, but the Continental have more vacant spaces than was absolutely necessary. In the gap between Racine and Scribe, surely Beaumarchais might have been allowed a place, and there was room, too, among the philosophers for Ampère and Leverrier. Among the Italian novelists D'Azeglio is wanting; among the historians, Cantù. Gervinus is ignored among German historians and essayists and critics. Mr. Trimble's rule of lettering is not easily understood. The only allusion he makes to it in his introductory explanation applies to the class "philosophers." "Those whose works are purely scientific and technical," he says, "and consequently have not passed into the literature of a nation, are placed in small type." This results in making Bacon and Carlyle (another instance of eccentric classification) pre-eminent among English philosophers, including Bentham and Darwin, to mention no others. If the works of two such revolutionary thinkers as these last have not "passed into the literature" of England, it is difficult to guess what business they have at all in a chart of literature. One is also inclined to ask why Rumford should not be emphasized as much as Franklin. As we do not feel that we have the key to this capitalizing, it is useless to remark that Mrs. Browning's name overshadows her husband's. The index is, so far as we have tested it, generally accurate, but it will doubtless bear careful revision. Sir John Bowring, for instance, did not die in 1858, but in 1872.

—There has been an interchange of letters during the past week in the *Evening Post*, in a controversy which everybody must regret, between an ill-advised friend of Mr. Anderson, the donor of Penikese Island to the late Mr. Agassiz, and Mr. Alexander Agassiz, his son and scientific executor. We call Mr. Anderson's friend "ill-advised" simply because he has rushed into print about a delicate and painful question without knowing more than one side of it. The School of Natural History on the island which Mr. Anderson hoped, and doubtless believed, he had founded, has just been broken up, and the furniture and aquaria sold at auction in Boston. This is certainly a very mortifying and unfortunate result of a very praiseworthy undertaking, and it is not surprising that Mr. Anderson should be annoyed by it; but he was wrong in allowing his friend to throw the blame of it, in his letter in the *Evening Post*, on the trustees, and to accuse them of want of courtesy to Mr. Anderson, want of respect for Professor Agassiz's memory, and, though last not least, a misappropriation of the "Memorial Fund" raised by the contributions of teachers throughout the United States in aid of the Cambridge Museum, in not using a portion of it to carry the Penikese school through its difficulties. The facts of the case are that Mr. Anderson's donation of the island and $50,000 in cash, though sufficient to start and equip the school, made no provision for the payment of its running expenses. He fancied he had supplied "the nucleus of an endowment fund," but in reality the whole of the sum contributed by him had been, with his knowledge and sanction, expended by the end of 1873 in the establishment of the school and the payment of its expenses up to that period. Had Professor Agassiz lived, he doubtless, with his strong faith and great capacity for raising money, might have found the means of carrying it on longer. When he died, it came into the care and control of Mr. Agassiz, his son, who accepted the trust most unwillingly, both because he did not consider Penikese a suitable location for the school unless largely endowed, and because he had already undertaken the heavy responsibility of carrying on the Museum, to which he had agreed with his father to give his best energies and all the money he could command. He took the directorship of the Penikese school, therefore, not only reluctantly, but after an interview with Mr. Anderson, in which he informed him that the Museum must be his (Mr. Agassiz's) first concern; that Mr. Anderson must contribute $10,000 towards carrying on the school for the three years next ensuing, after which, it was to be hoped, other means of support might be provided for it; and to all this Mr. Anderson agreed. At the end of the session of 1874 the trustees found

their funds exhausted and the institution $1,329 60 in debt, and informed Mr. Anderson of the fact, whereupon he forwarded a check for that amount, and curtly announced that this was the last contribution he would make. The institution was thus left absolutely without means of support. Appeals were made in vain to the Boards of Education of all the States and to the teachers individually, and a guarantee fund of $3,000 was contributed by a member of Mr. Agassiz's family, but nothing more came from any quarter. The Memorial Fund was, under the conditions of its collection, distinctly not available. Under these circumstances, the question presented itself to the trustees whether they should wind the school up or carry it on at their own personal expense—a course which Mr. Anderson's friend suggests in the *Evening Post* would have been only proper on their part, and which Mr. Anderson himself probably looked for. They decided on winding it up, on the simple ground that even if they had had stronger faith in its future, the Museum at Cambridge would need all the attention and money they could spare. How great have been the demands which this latter institution has made on those who have charge of it, may be inferred from the fact that the six trustees of the museum have contributed to it directly, or indirectly through the Agassiz Memorial Fund, the sum of $347,000 since 1873, when Mr. Anderson founded the Penikese School, and of this the larger portion ($197,000) has been contributed by the three gentlemen who also comprised the board of trustees of the Anderson School. This demand on their liberality will doubtless continue for some time. It is very unfortunate that Mr. Anderson, or the public, or somebody cannot be got to support the school; but it is very unreasonable to get angry because nobody chooses to do it, and because everybody thinks he is himself the best judge of the proper object of his bounty.

—In the *Nation* of November 13, 1873 (No. 437), in an article entitled the "Odium Philologicum," we endeavored to throw some light on the causes of the exceeding bitterness of feeling which is apt to mark all controversies about the grammar, spelling, and pronunciation of English, and of the tendency of such controversies to end in gross personal vituperation. At that date, a most shocking conflict between Mr. Richard Grant White and Dr. Fitzedward Hall had just come to a conclusion, in which the abuse became so foul that one of the disputants was obliged to veil his epithets in the obscurity of a dead language. We gave, as the result of such examination as we were able to bestow on the subject, an opinion that the explanation of the fury which is apt to mark philological discussions is to be found in the fact that "a man's speech is apt to be, or to be considered, an indication of the manner in which he has been bred, and of the character of the company he keeps. Criticism of his mode of using words," therefore, "or of his pronunciation, or of the manner in which he compounds his sentences, almost inevitably takes the character of an attack on his birth, parentage, education, and social position, or, in other words, on everything which he feels most sensitive about or holds most dear. If you say that his pronunciation is bad, or that his language is slangy or ill-chosen, you insinuate that when he lived at home with his papa and mamma he was surrounded by bad models, or, in plain English, that his parents were vulgar or ignorant people, etc." This view of the matter has recently derived striking confirmation from one of a series of articles on English pronunciation which Mr. White is now publishing in the *Galaxy*, and which we noticed two weeks ago. In this Mr. White, by way of preparing for a disputation with Professor Whitney, gives an account of his own parents and grandparents, of his own early education and surroundings during his boyhood, and compares them all with those of Professor Whitney. Most fortunately, however, he is satisfied with his antagonist's beginnings, and concedes that better conditions for the nurture of good English speech there could not be; so that, although we have no doubt that if Professor Whitney joins issue the controversy will end acrimoniously, nevertheless this similarity in the antecedents of the disputants greatly increases the chances of peace. But we wish to call the attention of our readers to the fact that nothing could well be more delicate than the enquiries with which Mr. White finds it necessary to open his attack. The result has proved satisfactory; but suppose that he had discovered that Professor Whitney's father was not a college graduate or the son of a graduate, and that his mother was not the daughter of a clergyman and graduate, and that he had not lived in cultivated circles in his earliest years—suppose, and it is not an extravagant supposition, that he had had to question the dicta or pronunciation of a "self-made man," the son of a Pennsylvania-Dutch teamster and of the daughter of an Irish liquor-dealer—how far could the discussion have gone before the "calling names" would have begun? How much of Mr. White's comments on the disadvantages of his early training would "the poor boy" on the other side have borne meekly? We must again warn Mr. White of the danger of the pursuit to which he is devoting himself, and again ask him whether his investigations cannot be carried on in some purely scientific periodical.

—The controversies about the origin of "the tapestry" preserved in the public library of the old Norman city of Bayeux have received an infusion of fresh life from the Abbé Laffetay, the curator of the public library at Bayeux. The *Pall Mall Gazette* affords us an opportunity of summing up the points of the Abbé's 'Notice historique et descriptive sur la Tapisserie dite de la Reine Matilde.' The vigorous defence of the old legend in this pamphlet goes far to settle the dispute. The Abbé holds by the old tradition that "the workmanship" is to be ascribed to Queen Matilda, the Conqueror's wife, which has been fiercely rejected by the historian Thierry, though he is willing to concede that its date is of the time of the Conquest. Mr. Bolton Corney (1836–1838) held that the work was executed by order of the Chapter of Bayeux Cathedral, and not till after the period when Normandy was reunited to France (1204), as was proved, he thought, by the use of the word "Franci" on the tapestry to designate the Norman invaders. M. Thierry, accepting Mr. Corney's suggestion as to the commission for the work having emanated from the Bayeux Cathedral Chapter, opposed his theory of the later date, triumphantly pointing out, with reference to the use of the word "Franci," that both in the Saxon Chronicle and in the laws of William the Conqueror the Normans are habitually so called. The Abbé Laffetay further remarks that the soldiers engaged in the Conquest were not Normans only, but men coming from many different parts of France. The opinion of M. Thierry that the tapestry was executed in London by English artificers is based on the fact that the Latin inscriptions which head the different compartments frequently betray a Saxon style of orthography; thus, among other instances, we have *ceastra* for castra (camp); Eadwardus, Wilgelmus, Hestenga, Ælfgyva, Gyrd, as proper names. But the Abbé meets this by observing that, as after a certain period in history it used to be said in France that there were no Pyrenees, so about the time of the Conquest it might have been said there were no Channel straits, and that Saxons settled so frequently in Normandy, both before and after that event, that it was a question of degree only which dialect was most in use there. The objections against the earlier date, that the city of Bayeux was burned in 1105, when "everything which escaped pillage perished in the flames," and that the fables of Æsop represented on the borders of the tapestry were not known in Europe till after the first Crusade, are also plausibly met, and the Abbé urges certain details of dress and architecture on the side of the eleventh against the twelfth century date. The chasubles of some of the figures correspond with those on sculptured figures in the nave of the cathedral. It is the round and never the pointed arch which is portrayed in buildings. In the rude representations of the towns of Rennes and Dinan, the donjon tower, the wooden bridge, are of the earlier style of fortification. The Abbé also cites M. Leopold Delisle, who adduces a Latin poem of Baudri, Abbot of Bourgueil, of the date of 1079, dedicated to Adela, daughter of the Conqueror and Queen Matilda, wherein a description is given of a certain tapestry adjoining the apartment of the princess, and representing all the details of the Conquest. "There is so much analogy," says the Abbé, "between this tapestry and ours that in reading the poem which describes it we ask ourselves sometimes which it is that Baudri means."

—Mr. Stanley, leading the joint *Herald* and London *Telegraph* expedition to Central Africa, reports by way of the Nile, in two letters his arrival at Lake Victoria Nyanza on the 27th of February, and his exploration, in the sectional boat carried by the party, of most of the confines of that sheet. The best map for studying his route is that published in Petermann's *Mittheilungen* for January 4, 1873 (19, Band I.) As far as Mpwapwa he followed the familiar road to Ujiji, but at that point he branched off last December, and traversed a distance of some 250 geographical miles through a country lying east of the course pursued by Speke, and therefore hitherto completely unknown. It is now filled for us with difficult names of districts and peoples, and for the present may be best remembered as an elevated plateau having a mean height of 4,500 feet, between the Nile basin on the north and that of the Rufigi on the south. The passage was not effected without great peril from warlike tribes, with one of which a pitched battle was fought, costing several lives on both sides. Disease also made sad inroads on the party, and two Englishmen had been taken off by fever when Stanley wrote. In circumnavigating the lake he reached Mtesa, the residence of the King of Uganda, on the north shore, near the Nile outlet, and here he met Col. Bellefonds, of Col Gordon's staff

in the Khedive's employ, to whom he entrusted his letters. Stanley corrects some of Speke's observations, and substitutes *Niyanza* for *N'yanza* as more correctly representing the native pronunciation. But his discoveries thus far are trifling as compared with those which he has in prospect. He aims to connect the detached links of previous explorers, and will therefore confirm (by descending its outlet) the undoubted, yet not absolutely proved, connection of the Victoria Nyanza with the Nile. He is next to explore the Albert Nyanza and discover its watershed, settle the question of its connection with Tanganyika (which he still believes in), and finally pursue to the end—whether in the Nile or the Congo—those fatal waters amid which Livingstone was stricken down. For the next six months we may, if he survives, expect to hear frequently from him ; for the military, if not the regular, Egyptian postal service now extends to the equator.

—The account furnished by the *China Review* of a visitation tour to several Protestant missionary stations in the interior of the province of Fo-kien, in Eastern China, presents a much simpler picture of the relations between the converts and the community around than that exhibited in our note on the Roman Catholic missionaries in the Western provinces. No guns, no crackers, no crowds, no sympathizing mandarins awaited the travellers, and their reception at a town about seventy miles from Foo-chow was as ordinary as that accorded to a pastor returning to a New England village after his summer vacation. The mandarins do not appear to be so vindictively inclined against the Protestant missionaries. The proselytizing work is nearly unmolested, and in some places tangible evidence exists of the hold which Christianity is gaining on the minds of the people. At Achia a church has been built large enough to seat three hundred auditors, to which the natives contributed five hundred dollars' worth of labor and material, four hundred dollars only having been furnished by the missionary society ; and "behind it stand a fine parsonage-house and school-room, lofty and well-built, raised by the Christians entirely at their own expense." The Christians here only number some forty adults besides their wives and families. This "insignificant result of eight years' labor" is explained by the assurance that "great care is taken to administer the rite of baptism only to those who are deemed thoroughly prepared for it." At Ning-taik, for example, two out of the seventeen candidates who offered themselves for baptism were desired to wait until the next visitation. At an administration of the sacrament on this occasion, the report adds: "While the prayer was being read, one of the recipients suddenly rose and quietly let down a neighbor's pigtail—it being as irreverent in Chinese eyes to pray with it rolled up as it would be in ours to keep the head covered." The missionary teaching has certainly won the confidence of even the non-Christian natives. At one station the travellers were informed that the natives in a neighboring village, being in want of a schoolmaster, had elected one of the leading Christians at the mission village to fill the office. Shortly afterwards the missionary received an earnest request, for the third time, from the inhabitants of a large village, that a catechist might be sent to reside among them. The evil effect of excessive opium-smoking was frequently forced on the notice of the travellers. "Opium-smoking and female infanticide were the two besetting sins of the locality." "Why is this and that house left to go to ruin ? The answer is, Opium. Why are they ready to sell land to the foreigner ? Money is wanted for opium. Why are there no girls ? Because the mothers kill them as soon as they are born. What for ? Because, as soon as they are grown up and begin to be useful, they will be married, and all the labor and expense bestowed upon them will be lost." The experience of the travellers on the point of general education is thus summed up : "So far as the agricultural population is concerned, national education is a myth."

—The September number of the *Deutsche Rundschau* closes the first year of its existence. The enterprise has, on the whole, been a successful one, the editor claiming a circulation of 9,000, and being able to point, for the first year, to a list of contributors which includes such names as Auerbach, Gutzkow, Spielhagen, Sybel, Lasker, Eduard von Hartmann, Max Müller, Wm. D. Whitney, Oscar Schmidt, Schweinfurth, Rohlfs, etc. In the next volume articles are to appear by Dr. Nachtigal, Haeckel, Von Holtzendorf, Carriere, and other writers of equal distinction. While a literary venture counting on the support of the most eminent authors of Germany may be said to carry success with it, it must be confessed that so far there has been a certain lack of evenness in the quality of the articles of the *Rundschau* not observable in its unsurpassed model, the *Revue des Deux Mondes*. Thus, the September number contains an article on the criminal classes of Vienna which would be considered reading matter of the lightest kind in any of our American magazines. Moreover, although it has not a line on theatres or concerts, in marked contrast to the earlier numbers, it is entirely wanting in scientific articles, if we except a very short critical notice of Dr. Fritz Schultze's 'Kant und Darwin,' by Oscar Schmidt. Nearly all the articles will, however, repay perusal, the most interesting being an extract from the memoirs of General von Brandt, 'Ueber die Märztage des Jahres 1848 in Posen,' which gives a graphic account of an interview with the Polish general Mieroslawski. Professor Alfred Woltmann discusses, with his usual discrimination, some paintings of Giorgione and Paul Veronese ; Dr. Felix Dahn writes about "Altgermanisches Heidenthum in der christlichen Teufels-Sage" ; Vámbéry talks entertainingly about modern Mohammedan princes ; and Julian Schmidt's "Schiller in seinen Briefen" treats of a subject of which Germans apparently never tire. The book-reviews by Friedrich Kreyssig are not particularly noticeable ; it may be doubted whether this department of the *Rundschau* ought to be exclusively confided to one writer. In the political review American affairs, as is so often the case with German journalists, prove a stumbling-block. Tweed, happily, does not yet enjoy his spoils "in peace and liberty," as is taken for granted by the *Rundschau*.

—It is well known that considerable dissatisfaction has been felt of late years with the progress of the great series of the 'Monumenta Germaniæ,' projected by the distinguished statesman Von Stein, and conducted for fifty years by Dr. Pertz. It was too gigantic a load for one man, and as he is now quite advanced in years, its direction has been entrusted to a commission, of which Pertz, Wattenbach, Euler, Dümmler, and Nitzsch are members ; other members have been nominated by the Berlin Academy (Mommsen and Waitz), the Vienna Academy (Sickel and Stumpf-Brentano), and the Munich Academy (Giesebrecht and Hegel). This commission held its first meeting in April, in Berlin. Prof. Waitz was elected president, and Prof. Mommsen, secretary. The work is now to be divided up, for more rapid and efficient administration. Mommsen is to have charge of the literature of the transition period between the Roman and the Germanic ; Waitz has for the present the later *Scriptores*, as well as the temporary charge of the *Leges ;* Sickel, the *Diplomata ;* Wattenbach, the *Epistolæ*, and Dümmler the *Antiquitates*. With this commission begins a new era in the enterprise. A smaller form is, by the way, to be employed, as far as practicable, instead of the immense, clumsy volumes of the old series.

## DR. ROWLAND WILLIAMS.*

DR. WILLIAMS'S name was forced into undue prominence because he was one of the two most obnoxious writers in the celebrated volume of 'Essays and Reviews' which made such a noise fifteen years ago, and gained the unprecedented circulation, for a theological work, of over 24,000 copies. He became, in his day, the most prominent advocate of freedom for Biblical investigation in the English Church. He was pursued with relentless vigor by the late Bishop Wilberforce and others. Every effort was made to secure his condemnation in the ecclesiastical courts ; he was compelled to withdraw from his professorship of theology in a Welsh college ; the Bishop of Salisbury would gladly have refused to institute him as Vicar of Broadchalke if he had been able to do so ; he had no organ ; he was so constantly persecuted for opinions which he did not hold that friends kept aloof from him ; he did not have the ecclesiastical position which would enable him to say with the best effect what it was most important for him to say ; everything was done to silence him ; and so it happened that the man who was the instrument of most signal benefit to the Anglican Church, and was, in fact, one of its most distinguished divines, was allowed to rust out in a rural parish and die in comparative neglect. The same thing happened to Keble, but under very different circumstances. The one attempted to restore free enquiry to the place assigned to it by the English reformers and divines ; the other instituted the Tractarian movement, and sought to bring out more fully the great Catholic ideas. Each one helped to continue the comprehensiveness of religious thought which belongs to a national church. Whatever obloquy may have been heaped upon Rowland Williams was borne silently. He saw beyond the present. He said : "I expect, when I have been dead one hundred years, some antiquarian will discover that I was all along doing the best, upon a given state of literary phenomena and circumstances, for the Church of England"; and when, in his last illness, life was ebbing fast, he remarked : "I do not know that there is much more that I could have done ; but there are some things I should like to have said, if I had had the right place to say them in."

He was born, Aug. 16, 1817, at Halkyn, in Flintshire, Wales. He was

* 'The Life and Letters of Rowland Williams, D.D. ; with extracts from his Note-Books. Edited by his Wife.' London : H. S. King & Co. : New York : T. Whittaker. Two volumes 12mo, pp. 426, 420. 1874.

the son of a Welsh clergyman and became one of the most enthusiastic supporters of Welsh interests in that Principality. He was a really religious boy, who dared to kneel down to say his prayers in the long chamber at Eton; a good scholar, and a great reader. He went to Cambridge in 1835, was a student of King's College, and afterwards tutor and fellow at the same for many years, gaining a brilliant reputation as a scholar, and acknowledged in 1845 to be "the only great Aristotelian lecturer in Cambridge." In early life his tendencies were High-Church, but never exclusively so. He felt that it was not right to submit to a theology in defiance of reason or in disregard of Scripture, but he never yielded in the least to those who would be disloyal to the Church. "Tilting against the doctrines of our Church is not an employment," he wrote in 1868, "with which I can ever have the slightest sympathy." When it was likely that he might be condemned by the Court of Arches, he wrote to one who counselled separation from the Church that "to obtain a legal verdict of immunity in the national Church for freedom of Biblical investigation would be a germ of much more, and better, than forming a new sect."

He won his first laurels as a literary man in the *Quarterly Review*, Lockhart regarding his contributions as "brilliant and masterly," and as the author of an essay on Christianity and Hinduism which was subsequently expanded into a treatise and has now become a classic work on the Hindu system of religion. It at once received the highest commendation from scholars like Bunsen, Ewald, and Max Müller, and is the class-book for the missionaries to India on this subject. These paved the way to that life of active thought on the philosophy of religion, and on the placing of religious truth upon a more reasonable basis, and one not in conflict with modern life, which he was destined to lead. He removed from Cambridge to take the substantial charge of St. David's Theological College at Lampeter, in Wales, in the spring of 1850, and in that rough country, and in the isolation from men which develops originality and strength of thought, worked out the opinions and purpose which marked his subsequent life. At that day the English Church had been helped out of the ecclesiastical quagmire of the last century in one direction by the Tractarian movement, but was very generally innocent of the advance in scientific Biblical criticism which had taken place in Germany, and which had been foreshadowed by the great English divines of the seventeenth century. Mr. Williams, made D.D. at Cambridge in 1857, felt that this stagnation of Biblical study was a reproach upon the Church. The intelligent laity were in advance of the clergy in the knowledge of modern criticism, and the danger of general scepticism was great and imminent. He determined to break the ice and show that theological criticism and intelligent, undogmatic thinking had not yet died out of his Church. He delivered his opinions in the shape of sermons on Rational Godliness at Cambridge without causing disturbance and without raising the cry of heresy. It was reserved for his own bishop, the venerable but weak Dr. Ollivant, to scent the heresy, misquote the professor, and stir up the clergy against him. The late Bishop Thirlwall, who held similar opinions as a scholar, at first gave him a certain judicial support, but finally charged against him. This sealed his fate, took away all chance of promotion to the Welsh episcopate, broke up to a great extent his usefulness at Lampeter, and made the English public suspicious of his teachings. His opinions have now been largely readopted in the English Church as its permitted teaching, and have been made most influential and pervading in England by the very men who fought most doggedly against them.

Though not the editor, Dr. Williams was a moving spirit in the 'Essays and Reviews,' which did so much to revolutionize the methods of Biblical study in England and America. He thus states the origin of that celebrated volume:

"Wilson, to my knowledge, first projected a theological review to be of the liberal, but chiefly literary, type. He got promises of help from Jowett and myself. I said I would review Bunsen and Renan, the latter being then only as yet in his philological stage. Finding we should not be numerically strong enough for the staff of a review, we agreed on a volume. Jowett got Temple to join; I got Charles Goodwin. . . . My own essay was written rather with the idea of a review still open, which accounts for the style; but it did not seem to require much change. Temple's essay was a recast of two university sermons. I never saw the preface before the book was published. . . . Baden Powell was, I think, the latest recruit when our numbers seemed hardly adequate. Wilson was the editor."

It is hardly possible to realize the tremendous excitement into which the ecclesiastical Britons went over this book. It contained nothing new, nothing which had not been intimated or stated by English clergymen of an earlier day, but it happened to be the starting-point for an ecclesiastical panic. "What we meant," says Dr. Williams, "was a literary combination with an undefined bearing on speculative theology as handled by scholars." "Many things in some of the essays, and some things in all of them, only became invidious by being dragged into juxtaposition with pieces in the others, which gave them a cross light, and sometimes a perverting one. . . . There was never any common league against any part of the Church's doctrines or formularies, nor any common understanding as against the reality of miracles." While the tempest of persecution raged, the essayists kept a dignified silence. "When we got, two of us, into court, not a word of an explanatory nature could be said, and the lawyers managed it their own way." But the impetus given to the circulation of the book by the prosecution of Dr. Williams and Mr. Wilson created thousands of readers; then replies were necessary; admissions were made; public religious opinion was educated; and though Dr. Williams, not silenced nor condemned, was nevertheless kept from any position of influence, the work which he initiated in a sermon at Cambridge in 1854 on the relation of Scripture to modern science and criticism, was consummated in the placing of religious truth on a more reasonable basis, in taking away the great reproach of English theology, and even in the elevation of three of the celebrated *septem anti Christum* to high places of trust in the Anglican Church. Dr. Temple as Bishop of Exeter, Dr. Pattison as rector of one Oxford college, and Dr. Jowett as the religious head of another, show the reaction.

Dr. Williams passed the last ten years of his life in obscurity, but by sheer force of inward strength he was raising himself, in spite of everything, to the position of a leader whom men sought because he had something to give them, when he died suddenly from a cold, January 18, 1870, lamented by none with more sorrow than by his humble Broadchalke parishioners. He had the companionship of Bunsen, Milman, Ewald, and men of that stamp, and his life and letters, edited by his wife with unusual fidelity, give a picture of the men and religious movements of the last forty years in England, and of the growth and variety of his own opinions, as strongly marked, as brilliant, and as interesting as Stanley's life of Dr. Arnold.

## PERSIAN HISTORY.*

FEW historical subjects can be imagined more interesting than the vicissitudes of Persia. The meteoric rise of Cyrus, who in the short space of thirty years founded an empire stretching from the Ægean nearly to the Indus; the romantic episode of the Grecian wars, which prevented that empire from becoming the dominant power of Europe as it was of Asia; its sudden extinction under the apparently hopeless assaults of Alexander; the Grecian and Parthian kingdoms founded on its ruins, which for centuries resisted more or less successfully the encroachments of all-powerful Rome; its marvellously sudden resurrection under the Sassanian monarchs, who for four hundred years revived the glories of the great king, to fall at last, as suddenly as they had risen, under the aggressive energy of Omar and his Arabs—all this affords an unequalled opportunity for picturesque narrative and philosophical investigation. The field has been assiduously cultivated, for, besides the intrinsic interest of the subject, its inseparable connection with Greece and Rome has made it a favorite study with historians, and Grote and Rawlinson and Gibbon have left few sources of information unexplored.

The English reader is thus abundantly supplied with accounts of the external history of the Persian race, but there is lacking what would be even more interesting and important: a careful analysis of the mythical period of Aryan development, with a philosophical investigation into the origin, growth, and modifications of the Mazdean religion—perhaps the most perfect that the unassisted mind of man has ever evolved. As a code for practical guidance through life, the system of Zoroaster has never been surpassed, and its influence in training the Persian race to its magnificent development is a subject worthy of the labors of the profoundest historian. Thanks to the researches of Anquetil-Duperron, Bournouf, Spiegel, Westergaard, Haug, West, Oppert, and other enthusiastic scholars, the materials for this now exist in abundance, and few ancient faiths can be more thoroughly traced in their successive stages than Mazdeism as shown in what remains to us of the Avesta u Zend, together with the Pehlevi and Pazand religious books—the Minokhired, the Dinkard, the Bundehesh, the Sad-der, etc. Something of this Rawlinson has attempted in his 'Five Monarchies,' but his treatment of it is necessarily limited in scope and unnecessarily imperfect in execution, and there is still room for a writer who, by careful comparison of Vedism with Mazdeism, shall seek to trace the outlines of the earliest religious formulas of our Aryan race, and shall follow their development step by step to the Zarvanism of the modern Parsee. If he can ap-

* 'Ancient History from the Monuments: Persia from the earliest period to the Arab Conquest. By W. S. W. Vaux, M.A., F.R.S.' 1 vol. 18mo. New York: Scribner, Armstrong & Co. 1876.

proach the subject without prejudices and preconceptions, he will be abundantly rewarded with the noblest ideas of the relations between God and man, the government of the universe, and the duty of man to his fellows. At every step, moreover, he will be met with startling coincidences between Mazdeism and Judaism, which suggest a community of origin ethnologically impossible, and which explain why the Jews, ordinarily so fiercely intolerant, could yet recognize in Cyrus the Lord's anointed, while Cyrus could see in Jehovah only another name for Ormazd.

Such being the inviting field which awaits a competent scholar, we took up Mr. Vaux's 'History of Persia' "from the monuments" in the full expectation of finding it fill an acknowledged gap in English literature. The author is a gentleman of no mean repute, Vice-President of the Numismatic Society and Secretary of the Royal Society of Literature, and as the "monuments," with the single exception of the Behistun inscription, have thrown singularly little light on Persian history, we naturally supposed that his efforts would be turned in those directions in which modern scholarship, by interpreting the religious "monuments" of Persia, has given scope for original research and thought. Mr. Vaux, however, has missed his opportunity—in fact, he appears to be too prejudiced or too incompetent to recognize that such an opportunity existed. He passes over, virtually, the whole legendary and mythical period, as though the Peshdadians and Kavas, Yima the Fair, and Thraetaona and Keresaspa and Kava Vistaspa were not as necessary to a comprehension of Persian thought as Hercules and Jason and Perseus are to that of Greece—to say nothing of the poetry that has crystallized around them in the Shahnameh. He even ignores the Median history, which is an indispensable precursor to that of the Achæmenidæ, and starts boldly on his task with the well-worn story of the conquests of Cyrus, disposing of all that goes before in the following fashion, which sufficiently illustrates his critical faculty and his comprehension of historical philosophy :

"How Cyrus attained to this pre-eminence has been much discussed, but we do not really want more than the notice in the Bible, which is remarkably clear and graphic : 'Then I lifted up mine eyes and saw, and behold, there stood before the river a ram which had two horns, and the two horns were high, but one was higher than the other, and the higher came up last. I saw the ram pushing westward and northward and southward, so that no beasts might stand before him, neither was there any that could deliver out of his hand ; but he did according to his will and became great.' And again : 'The ram which thou sawest having two horns are the kings of Media and Persia'" (p. 18).

Such being Mr. Vaux's idea of "history from the monuments," we are not surprised to find that he cannot spare room for translations or abstracts of what few inscriptions have been deciphered (except a very meagre account of that at Behistun, inserted in an architectural chapter remote from its historical position), but that he can give space, after finishing the career of Alexander the Great, to a long chapter on the prophecies of Daniel, in which the adventures of Nebuchadnezzar are discussed at length, and the various horns of the ram and the he-goat are distributed around among the empires, in the style of a twelfth-century commentator, concluding with a labored effort to identify Daniel's "Darius the Mede" with the dethroned Astyages, whom Herodotus assures us was Cyrus's grandfather—"Darius," according to Daniel, being aged 72 when Cyrus was 60.

If Mr. Vaux, in seeking for light on Persian history, had turned to the Avesta and Minokhired, instead of to the Scriptures, he could at least have saved himself from many blunders, even if his illogical habits of thought had prevented him from doing himself credit. We doubt, indeed, whether he has ever looked into the sacred writings of the Persians, for the only reference we have observed to the Avesta (p. 9) quotes a statement which is not to be found there. A very slight knowledge of Mazdean belief would have saved him from quoting (p. 103), without correction, a passage from Dean Milman, in which Ormazd is identified with the Sun, and borrowing from Gibbon (p. 184) a speech attributed to the Sassanid Chosroes, in which he is represented as worshipping the Sun. The fact is that in pure Zoroastrianism the spirit of the Sun was not even an Amshaspand, or archangel, but only an Izad, or angel ; during the later Achæmenian period the Magian nature-worship for a short time caused Mithra and Anaitis to be reverenced as next to Ormazd, but in the Sassanid revival, as shown in the Minokhired, the Sun was absolutely relegated to a position among the Seven Planets, who were leaders of the hosts of Ahriman. For a writer of the present day to accept Mazdeism as Sun-worship is to commit the most serious of blunders—only to be rivalled by the kindred one (p. 14) where the Semitic religions in general (including of course the fetishism and anthropomorphic pantheons of the Assyrians and Phœnicians) are asserted to be "superior to the best which the Japhetic races have worked out."

In short, with the exception of a few facts derived from the study of Persian coinage, the book is a singularly bald, lifeless, and disjointed condensation of that which is to be found in almost every school-book, interspersed with dreary accounts of ruins borrowed from Ker Porter and other travellers, and written in an amorphous style, of which the following may serve as a specimen :

"It is clear that if Cyrus deserves the title of the actual founder of the empire, in that he was the first to conquer a large portion of the territory his successors ruled, Darius more, that he welded it into a consistent and well-working machine, which, indeed, it was no fault of Cyrus that he had been compelled to leave in the rough" (p. 45).

## TRAVELS IN PORTUGAL.*

THE first thing to be desired in a book of travels is that the ground traversed should be little known ; that it should be worth knowing is quite a secondary affair. Of more importance than this is the author's cleverness, which should be of such an order as to dissimulate, when need be, the barrenness of his theme. These two main requisites Mr. Latouche very happily combines. Portugal is of course not such a *terra incognita* as Afghanistan, but it lies fairly well out of the beaten track of travel, and we are not aware that it is as yet included in any of Mr. Cook's great programmes. Mr. Latouche has made an exceptionally agreeable, in fact, a very charming, book about it. And yet, upon his showing, it does not appear that Portugal is especially well worth seeing, or that the tourist world is greatly the loser by leaving it alone. It is true that Mr. Latouche pretends to speak only of the more untrodden portions of the country, holding, as he does, that enough has been said about the highways and the commoner resorts. An entertaining account of these has lately been published by Lady Jackson in her 'Fair Lusitania,' and Mr. Latouche engages chiefly to describe what Lady Jackson has not touched. It may be added—Mr. Latouche can afford the concession—that the author's weak point is the description of scenery. He has evidently an eye for the landscape, but he has not the art of sketching it very vividly—his phrase is but scantily pictorial ; so that often he fails to give a very definite idea of what the traveller gains by visiting certain places, the truth being that he finds his remuneration in the picturesqueness of the scenery. Yet for all this Mr Latouche is eminently readable. Intelligent, observant, humorous, with plenty of general as well as of particular information, and with an unusual talent for putting himself in the place of other people, and judging them sympathetically and imaginatively, he is always an irreproachable companion. The main fault of his book is a certain want of method and of definiteness. It is a record partly of a residence—apparently a long one—and partly of a journey. It is not always obvious when the continuity of the journey is broken and other seasons and occasions are alluded to. Apropos of seasons, is is not always apparent to what time of the year the author refers. It would seem from some parts of his narrative that he found it comfortable to jog over the Portuguese byways on horseback in the summer ; but does he recommend this course to other travellers ? It is also Mr. Latouche's misfortune that he took no notes of his observations at the time they were made, and that his book is written wholly from memory. This, however, is an omission that we can forgive. There are so many hungry book-makers wandering about the world nowadays, twisting every trifle into a memorandum, and expanding every memorandum into a chapter, that we feel a real kindness for a book which has got itself written in the face of difficulties.

Mr. Latouche entered Portugal from the northwest corner, travelling on horseback across the Spanish frontier. He gives an account of a wonderful horse which he picked up at Vigo, and which carried him bravely over the northern mountains to Braganza on the eastern frontier. The decayed city and castle of Braganza give their name to the reigning dynasty of Portugal, but they appear to have impressed Mr. Latouche with nothing so much as the strong Jewish type of their inhabitants. This leads him into a digression—his digressions are frequent, but always interesting—upon the Portuguese Jews in general. The influx of Jews into the kingdom when the persecutions of Ferdinand and Isabella compelled them to leave Spain was very great ; and in Portugal they found a *modus vivendi* which, though still hard, was easier than the Spanish rule. Vast numbers of them, however, passed on to Holland, where, says Mr. Latouche, the Portuguese Jews have always formed the cream of the great Hebrew plutocracy of Amsterdam. In another line, Baruch Spinosa was by descent a Portuguese Israelite. Many Jews, however, remained in Portugal and embraced Christianity, and Mr. Latouche affirms that their blood flows

* 'Travels in Portugal. By John Latouche.' New York: G. P. Putnam's Sons. 1875.

very freely at this day in the Portuguese upper classes. It was formerly thought safe to call any Jew of a certain type a Portuguese, and Mr. Latouche seems to think it safe to call any Portuguese a Jew.

From Braganza the author struck diagonally through the mountains and mountain-towns to Oporto, where his picturesque ride appears to have terminated. His account of it and of his wayside adventures, his odd meetings, and his glimpses of the local superstitions, is the best portion of the book. Upon Oporto—a city which apparently has little but its wine to recommend it—he is as entertaining as the theme admits, and upon Lisbon he is reserved, although he ventures to think the beauties of Cintra overrated. From Lisbon he takes his reader southeastward by rail to Evora and its numerous Roman remains. Roman relics, he intimates, are in Portugal even importunately frequent. "I doubt," he says, "if the monumental inscriptions in all Great Britain, all the English-Roman mosaics, baths, coins, milliary columns, put together in a single county, would lie so thickly on the ground as they do in the small district round Evora, Elvas, and Beja." Mr. Latouche proceeds thence to Monsaras and Mourao—a region thick in Moorish memories—and thence by boat down the Guadiana to the southern coast. He found the people of the Southern provinces a quite different race from the mountaineers of Beira—the great province north of the Tagus—and an inferior one, being lazy, dirty, and shiftless. The sum of Mr. Latouche's observations strikes us as being that Portugal is a good country to visit after one has been everywhere else. It is thoroughly different from Spain, and apparently best described by negatives. The best scenery is not first-rate, and what remains apparently not even second-rate. There are no inns (to call inns), no architecture, no painting, no monuments, no local customs of a striking nature. Lisbon, thanks to its earthquake, is a new city, and a commodious; but if it has lost in picturesqueness, it has not gained in those resources and diversions which enliven existence in other capitals. It is beautiful but dull. There was once a Portuguese architecture, and here and there is to be seen a remnant of fine early Gothic, but for the most part the old churches have been veneered with the ugly Jesuit flamboyant of the seventeenth and eighteenth centuries. There never was a Portuguese school of art—though local patriotism, whose intensity is so often in direct proportion to its want of a *raison d'être*, has endeavored to put forward a shadowy semblance of one. Mr. Latouche, however, devotes several pages to the discussion of a certain great church-picture at Viseu, that of the mythical "Gran Vasco," which has long been ascribed to a Portuguese hand. The picture (three subjects from the life of Saint Peter) is apparently a very fine one; but Mr. Latouche sets forth with a great show of reason that it is the work of a Spaniard not unknown to fame—Luis Velasco, a contemporary of Velasquez. The best thing in Portugal, according to Mr. Latouche, is the Portuguese, whom our author evidently greatly prefers to the Spaniards. As a compliment to them, he affirms that their bull-fights are mild and tame to imbecility; but we cannot help wondering whether the compliment would not really be greater if he were able to say either that they had no bull-fights at all, or that they managed them well.

---

*Deutsche Verfassungsgeschichte.* Von Georg Waitz. 5 und 6 Band. (Kiel: Ernst Homann. 1875.)—A new instalment of Waitz's great work on the 'History of the German Constitution' is an event of the first importance in historical literature. It is fourteen years since the fourth volume was published, in 1861, and in the meantime new editions of the two first volumes have appeared, so thoroughly revised as to be almost rewritten, and the continuation of the work has been impatiently waited for. The present volumes ('Constitution of the German Empire, from the middle of the IXth to the middle of the XIIth Century') cover a period of peculiar interest and difficulty—the transition time between the reign of Charles the Great and the fully developed feudal régime. Each volume contains four chapters: 1, *Die Ausbildung des deutschen Reichs*—a sketch of the political history of the later Carolingian and the Saxon House; 2, *Die Verbindung mit dem Kaiserthum*—covering the most important external relations of Germany; 3, *Das Reich und seine Theile*—the internal organization of the realm; 4, *Das Volk und seine Stände*—the structure of society; 5, *Das Lehnwesen*—the feudal system; 6, *Der König*—royalty; 7, *Der Hof, die Reichsregierung und die Reichsversammlung*—the administrative system; 8, *Recht und Gewalt im Reich*—the legal system. Prof. Waitz's peculiar excellence as a writer, no less than as a lecturer, is his unusually clear, simple, and unimpassioned style. The results of the most profound and unwearied investigations are presented here so succinctly and luminously that the reader almost fancies that he knew it all before. It is, indeed, the summing up by a master of the conclusions reached in detail by a number of independent enquirers. There is little discussion, but very abundant references, comprising on an average, in ne type, much more than half of every page.

It will be enough here to call attention to two or three of the most important points in the view of the German institutions here presented. In the first place, the writer combats vigorously (Vol. V., p. 70) the idea that the German kingdom, during the period under discussion, was in any sense a confederation: giving all weight to the elements of independence that existed in the great dukedoms, they were parts nevertheless of one united state. In relation to the connection of Germany and Italy, he likewise takes position (p. 116) against the prevailing opinion that in this connection are largely to be found the causes of the dissolution and decay of the German realm. On the contrary, "in the midst of the severe contests which the kingdom had to endure at home and abroad, the German nation advanced to that stage of manifold rich life which held sway in the twelfth and in the beginning of the thirteenth century," until which time he sees "no retrogression in public relations, only a transformation (*Umbildung*) of the constitution." The fourth chapter occupies more than half of the volume, and is also much the most valuable, both as regards its subject and its treatment. It contains an elaborate analysis of society in the two centuries just before the full prevalence of feudalism (*bis zur vollen Herrschaft des Lehnwesens*) under the several principal grades—slaves, *Censuales* (those who paid money to their lords), *Ministeriales* (those who paid in services), Freemen, and Nobles. Under the head of the Freemen we have an interesting discussion upon the origin of the free population of the cities. Of single points introduced incidentally we will mention one in relation to the Jews. It is shown (p. 370) that during the period in question they were treated fairly and even liberally, being regarded as an important element of the industrial population in the growing cities; it was not until the lower classes had been excited to intolerance by the preaching of the Crusades that the public policy was changed in regard to them. Of the nobility, too, it is shown that they did not at this period form an hereditary class, but that the higher class of freemen were styled indifferently *nobles*, while the term *prince* was applied to the high officials of the state—dukes, counts, and the higher ecclesiastics.

In the sixth volume Prof. Waitz still insists—in opposition to Roth—upon his view that the system of benefices had an early and gradual development (p. 6), and that it was closely and essentially connected with vassalage (p. 35). The chapter is, however, as a whole, rather devoted to a description of the system than an account of its development, this having been sufficiently traced in the former volumes. In the seventh chapter (p. 354) we find some interesting remarks upon the lack of a competent and efficient body of officials; from which resulted the necessity of a continual perambulation of his dominions by the king in person. In the eighth chapter the view already mentioned, as to the effects of the connection between the empire and the German kingdom, receives new illustration; touching the relations of the twofold office of King and Emperor, he says (p. 364), *Imperium* and *Regnum* are never strictly distinguished, but both are used to express the opposition to the priestly power, *Sacerdotium*. We are disappointed not to find any account of the government of the cities during this period. No doubt their vigor and glory came later; but they of course had some government now, and the more obscure the subject, the more we should rejoice at its discussion by Waitz.

It would add to the clearness of this treatise if the relations of Germany and France in the development of feudal institutions were more distinctly pointed out. There are a few points incidentally brought in, such as a hint that Germany was behind France in the development of feudalism; the statement that feudal reliefs did not exist in Germany during this period (Vol. VI., p. 28); and the interesting fact (p. 50) that in France the "fealty of the vassal received an interpretation which lays special emphasis upon the ethical signification of the relation." But the student would be grateful for a brief comparison of their elements at the close of the period treated. We are more accustomed to study mediæval institutions from the French point of view, and it is not easy, even from this admirably perspicuous work, to gather a conception of the synchronisms in their development.

---

*The Germania, Agricola, and Dialogus de Oratoribus of Tacitus.* With Explanatory Notes by George Stuart. (Philadelphia: Eldredge & Bro. 1875.)—This edition of the minor works of Tacitus is a careless compilation from a few authorities. Neither in the treatment of the text nor in the commentary is there any evidence that the editor is familiar with much of the solid work that has been devoted to Tacitus, or that he has made a thorough and sympathetic study of Tacitus himself. The text adopted is professedly Halm's, but Halm's readings are again and again silently abandoned, and especially unfair to that conscientious scholar is the ignor-

ing of the modest caution that he shows by marking many passages as corrupt or doubtful. Where, too, did Mr. Stuart find the words *magnae cujusdam felicitatis esset*, which are foisted into the 'Agricola,' chapter xliv., without italics and without a word of comment? After the rhetorical thanksgiving in the preface to German scholarship we naturally look, but we look in vain, for some use of or at least allusion to the fruitful labors of such authorities as Haupt and Nipperdey. For the 'Dialogus,' the editor seems not to have been even aware of Michaelis's critical recension, nor of Andresen's 'Schulausgabe' and 'Emendationes.' The garbled use of Brotier's attempt to bridge over the chasm between chapters xxxv. and xxxvi. of the 'Dialogus' neither represents Brotier's idea of the missing passage nor is it consistent with the argument at the beginning of Mr. Stuart's own notes, while the Latinity of the fragment—as, *e.g.*, *machinamenta*, *praesentiscebat*, and *publicam rem*—is (*pace* Brotier) very questionable, certainly not Tacitean. If an American editor of the 'Germania' cannot agree with Prof. W. F. Allen's valuable monograph on the force of *dignatio* in that treatise, he should at least give the grounds of his own theory.

Only once, if we mistake not, does our compiler drop his leading-strings, and then with ill-success. Certainly, an appreciation of Tacitus's conception of fate and of the empire, or a comparison of the passage with almost identical phraseology in Virgil and Livy, from whose language Tacitus drew very largely, or even a glance at Boetticher's Lexicon Taciteum, might have saved Mr. Stuart his awkward attempt at explaining *urgentibus imperii fatis*, 'Germania,' chapter xxxiii. The grammatical notes can be of little worth, unless the great object in reading Tacitus is drill in elementary parsing, and to the tyro in Latin what but confusion can come from the slipshod and inconsistent notes on *visu* (p. 163) and *memoratu* (p. 177)? What true idea of Roman law can one derive from the vague remarks on *exceptio* and *formula* (p. 224)?

But we had no intention of giving space to the details of this book. We have looked through its pages in vain for any appreciation of the great advance that has been made in the last twenty years in textual criticism, or in Latin scholarship, or in general philology. The great change, too, which had come over both the form and the spirit of the Latin language in the time of Tacitus, is alluded to only in a few vague and borrowed generalities. The species of success which Mr. Stuart's editions of some of the easier Latin authors have had, seems to have emboldened him to undertake a work for which he is not qualified. A judicious edition of Tacitus for American students is still a desideratum.

---

*History of the Roman Empire*, from the Death of Theodosius the Great to the Coronation of Charles the Great, A.D. 395–800. By Arthur M. Curteis, M.A. With maps. (Philadelphia: J. B. Lippincott & Co. 1875. 12mo, pp. 279.)—Mr. Oscar Browning's series of 'Historical Hand-books' deserves to be mentioned in connection with the three series of Messrs. Freeman, Morris, and Green, as an outgrowth of the new interest in the study of history in England. In character it is more like Mr. Morris's series, 'The Epochs of History,' although the authors are not so generally men of recognized eminence in their several fields. Neither is it so exclusively devoted to political history, for a history of French literature makes a part of it, and a history of modern English law is in the press. The opening volume of the series, Mr. Smith's 'History of the English Institutions,' was reviewed by us last year (see *Nation*, March 26, 1874); Mr. Pearson has in the press a History of England in the Fourteenth Century; and we are promised the Great Rebellion, the French Revolution, the Age of Chatham and that of Pitt, the Reign of Louis XI., the Supremacy of Athens, the Roman Revolution, and the United States. Mr. Curteis's history of the Roman Empire during that transition period when it used to be said that there was no Roman Empire at all, is a book of great merit. The style is somewhat stiff, and at times a little faulty. For instance, we suppose that "the former" and "the latter" should be avoided as far as possible, for the sake of perspicuity; but on page 213 we find them used three times, besides the far more objectionable "these" and "those" in referring to antecedent nouns. The author says that his book, which lays no claim to originality of research, is based upon a course of lectures delivered in the school with which he is connected. It has had, therefore, the best of tests as to its fitness for school work, and we will say that it seems to us admirably adapted for introducing the young reader to a vivid and genuine knowledge of this period. We mark, for instance, very strong indications of the influence of Mr. Freeman and Amédée Thierry, to both of whom the author expresses strong obligations. The chapter upon Attila and the Huns is an excellent example of his best work. It seems, however, a mistake to introduce the chapter by a quite long and really capital discussion of the "Etzel-Sage"; it would have come in very well at the end of the chapter, or would have answered as it is for older readers. The chapter upon Mohammed is introduced in a similar manner, but this is less objectionable. Everybody knows something about him, but the notions about Attila are very vague where they exist at all, and in his case the story should precede the discussion. It is implied, on page 30, that Constantine declared himself a Christian A.D. 313, while it was really not until ten years later. The Franks are plumply pronounced a Low-Dutch people on page 52; a matter as to which there is still felt considerable doubt. *Dominii* (p. 262) is of course a misprint for *dominici*. The maps are hardly worthy of the book; they are clear, but might have been equally clear and yet considerably fuller.

---

*Plays and Players.* By Lawrence Hutton. (New York: E. P. Dutton & Co. 1875. Pp. 276.)—The papers here collected have already appeared in an evening journal of this city, and they occasionally show the incoherence consequent upon such a method of composition. They form a sort of irregular or guerilla supplement to Ireland's 'Records of the New York Stage,' supplying harmless and gentle gossip about many of the comedies and comedians seen at the theatres of this city during the past twenty-five years. A few pages are given to Edwin Forrest and to Miss Cushman; but there is little more than bare allusion to Macready, Salvini, Ristori, or Rachel. Although Mr. Hutton is very enthusiastic about the comic drama, he seems to have but little sense of humor, or he would never have ventured the complacent insertion of the grotesque paraphrase of Tennyson's farewell sonnet to Macready (p. 232), brought down to date by the substitution of Miss Cushman's name for that of the English tragedian. A few new anecdotes, and many interesting incidents pleasantly told, are to be found in the book. In style it is much the superior of Ireland's work or of Brown's so-called 'History of the American Stage,' in which paste-and-scissors and the most high-flown fine writing are curiously commingled. The great defect of the book is the absence of anything like criticism. Mr. Hutton sees no faults, and is as indiscriminate in his praise as if he were writing an obituary or an eulogy. However, his pleasant and unpretending reminiscences will recall to the reader many evenings of enjoyment. This is the great merit of the volume. Whatever deficiencies it may have are almost atoned for by the admirable triple index of persons, plays, and play-houses, which occupies twenty pages, and doubles the value of the book.

---

*The Childhood of Religions:* embracing a Simple Account of the Birth and Growth of Myths and Legends. By Edward Clodd, F.R.A.S., author of 'The Childhood of the World.' (New York: D. Appleton & Co.)—This work, like its companion volume, 'Childhood of the World,' is an attempt to present in a simple and popular form the results of scientific research. It is not a mere piece of book-making, but has been done by a man of real knowledge, with a view to the practical aims of education, and is written in a style adapted, we should say, to the comprehension of young people of about fifteen. The author's point of view is thoroughly and avowedly rationalistic; and any person who thinks it not only desirable but possible to keep his children from the knowledge that such views exist, would of course take care not to put this book in their hands. Nevertheless, there is nothing offensive or obtrusive in it. It simply presents that comparative view of religion which has become the leading one among educated men of the present time, not so much opposing as ignoring the popular notion that there is but one genuine religion, and that all others are utterly worthless. Perhaps we should except Chap. XIII., "On the Study of the Bible," which teaches that "the Bible should be read as we read other books," and which is more controversial than most of the volume. Most of the chapters, however, treat of subjects entirely disconnected with the Christian religion—as the Aryan religions, Buddhism, Mohammedanism, etc. There are a valuable appendix and a good index.

*NEW YORK, THURSDAY, OCTOBER 28, 1875.*

## The Week.

THE result of the late elections and the eulogies of the Republican Conventions seem to have restored to the President some of his old courage and self-confidence, and he has accordingly selected Mr. Zachariah Chandler, of all men in the world, for the Secretaryship of the Interior. Mr. Chandler is one of the worst of the bad type of public men which the war brought to the front; but even if he were not, his personal habits are notoriously such as to disqualify him for any place of dignity or trust in the public service. He played a creditable part in the discussions of last winter on the currency, but this is the only creditable thing in his career during the past ten years. He possesses a large fortune, and is thus raised above the commoner kind of temptation, but his friends and associates would almost necessarily be men of a class to which corruption is a calling like another. He was last winter ousted from his seat in the Senate by the Michigan Legislature, although he is not a man to stick at trifles when he wants an office, and his defeat was universally regarded as one of the best fruits of the indignation which led to the general uprising against the Republican party last fall. His selection now for a place of so much responsibility as the Department of the Interior, so close on the scandals which have just led to the retirement of his predecessor, cannot but be regarded as a fresh proof either of General Grant's contempt for the moral sense of the best portion of the community or of his inability to comprehend it, and is of a piece with the renomination of Boss Shepherd. It is, of course, a serious blow for the Republicans in the States in which the fall elections have still to be held, and their efforts to put a good face on it are in some cases very amusing. In Massachusetts, it is peculiarly inconvenient, and the Boston *Advertiser* accordingly says that Mr. Chandler is "a much more honest man than his enemies give him credit for being"—a remark which might be made with justice of many "statesmen" now confined in the Charlestown jail. It also adds "that he wears his faults upon the outside, and all the world knows them," which reminds us of a recent illustrated joke in *Punch*. A dealer is exhibiting a doubtful-looking horse to a possible purchaser, who is pointing out some of the animal's obvious defects. "Oh, yes," says the dealer, "I know all about that; anybody can tell what his bad points is, because we sees 'em; but what I say is, that we can none of us tell what his good points is, till we come to find 'em out."

---

What adds to the discreditableness of Chandler's appointment, but at the same time gives it peculiar significance, is the fact—for fact it is—that it was his conduct with regard to civil-service reform in the Department of the Interior which led to Mr. J. D. Cox's resignation. Chandler went down to the Department, and in the halls publicly, in his usual coarse language, denounced Secretary Cox for his civil-service interference with the political use of the Department or its clerks, and threatened, to use his own phrase, "that he would have Cox's head in a basket in a month." It was this performance which made Mr. Cox feel that he must at once ascertain whether the President would support him in his attempts to purify the service against such politicians as this man. Our readers know the result. It is by no means an unfair or unreasonable assumption, now, that the selection of Chandler for Cox's place indicates that the President has important work for him to do, and knows that he is the man to do it. Mr. George W. Curtis and civil-service reform will not serve his purpose this time, so he is going to try "Old Zach." and civil-service corruption. Very few of the Administration papers venture to defend the appointment, and these only in a half-hearted way. All the New York *Times* can say for it is that Chandler is a good man to "sit up nights and tell stories." We would earnestly call the attention of honest voters to the circumstance that nothing but defeats of the Republican party at the polls seems to secure "reform within the party." That of last fall put Pierrepont and Jewell into the Cabinet. Even a trifling success has given us Chandler in the Department of the Interior.

---

Mr. Bristow has obtained a decided success in his onslaught upon the Western Whiskey Ring, has got one of the most prominent members of it convicted, and has recovered judgment for half a million dollars. The news is said to have caused a great sensation in "distilling circles." This victory has rather thrown the Democratic recovery of twelve thousand dollars from the Canal men by Tilden into the shade; but, on the other hand, the Republican judgment is itself surpassed by that in the Watson case in this city. The city has got judgment against the estate of Watson, who made his money by "auditing," for between six and seven hundred thousand dollars. This is the largest amount of all, and we beg leave to call the attention of the party press who are rejoicing over the victory of Mr. Bristow to the fact that this sum has been recovered by the Third party, representing the Independent voter, and must not be claimed by either of the regular organizations. Now that all sums of money recovered from public plunderers appear to be counted as legitimate political capital, notwithstanding the fact that those who recover them are generally the very persons who were entrusted with the duty of preventing the theft, it will be more and more important that the "capital" shall not be erroneously distributed among the claimants. At present it stands, Tammany Democrats $12,000, Regular Republicans $500,000, Liberal Republicans 0, Anti-Tammany Democrats 0, Independent Reformers (New York) $600,000. Comment on these remarkable facts is entirely unnecessary, for we have no doubt that, as the politicians say, "the people will understand them."

---

The Mississippi war, which came to a sudden end a week ago, owing to the discovery made by the leaders on both sides that no more troops were to be had from Washington to carry it on with, has not begun again, and all the telegraphs to Washington now say that peace and harmony reign throughout the State, and arrangements have been made by which fairness and a spirit of concord will prevail in the future. This peaceful conclusion shows very strikingly how the race hostilities in the South have been kept alive by the expectation of troops from the North for the suppression of supplementary rebellions. Mississippi is, of all the Southern States, perhaps best fitted to breed this sort of trouble, if there were any real occasion for it, as it has a large and ignorant black population, and among the whites a considerable number of lawless fellows fond of knifing and shooting, and, besides this, a Northern "satrap" at the head of the government, who, to judge by his proclamations, has never even read through the Constitution of the United States, and has derived his notions of the "war-power" from conversations with his father-in-law, B. F. Butler. Of course there may be fifty explanations of the present peaceful condition of the State, as there were for the sea-captain's omission to salute the flag-ship, but we strongly suspect that the first of them would be like his—that the gunpowder had given out.

---

Mr. Conkling's speech at Albany on Monday week, of which we were able only to make mention in our last issue, was as usual the formal opening of the canvass by the Republicans. The speech was of the kind he always delivers, and may safely be said to contain the whole Republican case. He recited once more the history of the Democratic party during the war, and hinted that if they got into

power at Washington they would seek to carry out some of their old designs; showed that the foremost question now before the people of this State is reform; described different kinds of reformers—the selfish reformers, the hypocritical reformers, and the pure and good reformers, and placed the Republican party in the last category, mentioning several cases in which it had "reformed" in a quiet, unostentatious way; argued elaborately that the Canal frauds originated under Democratic rule, and had been carried out mainly with the connivance of Democratic State officials, and proved, by figures taken from the Albany *Evening Journal*, that the canals had been more economically administered under Republican than under Democratic management. He thanked Governor Tilden, however, for the little he had done in the way of Canal reform; severely castigated Mr. John Bigelow for going on the Canal Commission as a Republican and then accepting a Democratic nomination; then drew attention to the extravagance of Democratic rule in New York City; maintained that it was the successive attempts of the Democratic party to bring about repudiation in some form which made American credit so low in Europe; that the present depression in business prevails all over the world, and the Republican party is, therefore, not to blame for it; that Republicans are wholly sound on the financial question, the talk of a few individuals to the contrary notwithstanding, and that the Democrats are wholly unsound; that the public schools are threatened, and must be protected by the Republican party, and that the Democrats cannot be trusted with them; that "Boss" Kelly is a very bad man, and the Democratic State ticket has no claims to confidence and is "piebald," while the Republican ticket contains the names of pure and good men only. He concluded with a prediction that if the Republicans all voted they would carry the day. About the third term and the Administration he was judiciously silent.

---

The *Evening Post*, commenting on this speech, reads Mr. Conkling a lecture on the use he has made of his talents. It describes him as "one of the foremost men intellectually in the State." "His brain," it says, "has always firm grasp of principle"; "he could if he would take a position in the first rank of statesmen," and "might have made himself a place in the highest order of those who guide the destinies of nations." It then gives a melancholy picture of what his career has really been in spite of these magnificent opportunities, and describes it, as we have so often done, as that of a man who "has supported his party, managed conventions, and has manipulated appointments, but has originated no measure of vitality or importance." We shall take the liberty of saying that this account of the *Post's* of Mr. Conkling's talents is pure fiction, and is, in fact, exploded by its account of his career. Whether Mr. Conkling is "one of the foremost men intellectually in the State," or "could take a position if he would in the front rank of statesmanship," is something about which neither the *Post* nor anybody else knows anything. Mr. Conkling has never given any evidence whatever of the possession of such powers as the *Post* ascribes to him. He has never displayed any statesmanship whatever. He has made no speech showing a large or "firm grasp of principle." He has originated no legislation showing ability or knowledge of any kind. In the absence of such exploits, the well-settled presumption is that he is not a statesman, or anything but a common politician. Mr. Conkling's speeches are all like the last one—the somewhat dexterous discourse of an attorney showing that the pot is as black as the kettle and even blacker than the kettle. He delivers about half-a-dozen of them every year, and he has half-a-dozen organs which forthwith fall to pretending that he has rivalled Burke, and half-a-dozen genial enemies who fall to pretending that he could rival Burke if he would. Mr. Conkling's kind of politician will always be useful, and so will his kind of speech, but it would be very unfortunate to have the country remain under the impression that men of the highest order of political ability do even occasionally pass their lives as wire-pullers and manipulators. Men who are competent to "take a position in the front rank of statesmanship," and have Mr. Conkling's opportunities, take it. There is no case on record, and there never will be one, of a master-mind expending itself on the composition of "slates," the "laying of pipes," the control of conventions and primaries, and the drafting of buncombe platforms.

---

City politics, as the election approaches, grow more rather than less complicated. The main part of the duty of the press before an election now is the examination of "charges" brought against all the candidates, and we have accordingly given careful attention to those made against Recorder Hackett, drawn up in a thick pamphlet, no doubt by some minion of the "new Boss." It must be confessed that the Boss makes out a pretty good case. First, the despot produces a letter from Wheeler H. Peckham, who has been connected with the Ring suits from the first, in which he, among other things, accuses the Recorder of allowing indictments of Sweeny, Woodward, Tweed, and Smith, in his court, to be *nol. prossed* and the *nol. pros.* to be antedated by five days, so as to cut off the possibility of a writ of error; second, a long record of sentences for all sorts of crimes, "suspended" by Hackett without the slightest authority; third, a fraud in street-openings. Hackett, it is alleged, was appointed in 1866, with two other men, to lay out "the Circle" at the intersection of Eighth Avenue and Fifty-ninth Street, with a radius of two hundred and twenty-six, for which the Commissioners were entitled to thirty cents a foot "for the lineal extent of the street or avenue," making Hackett's share $139 03, instead of which he pocketed $3,000; and the Boss adds that, on being asked how he could claim such an allowance, the Judge replied, no doubt with great solemnity, "We measured a spiral line commencing at the centre and screwing its way out." It looks from this as if it would not do for the independent voter to take too much interest in Mr. Hackett's re-election. We had not supposed before that his "record" was so dark a one. Another judge, by the way, who is up for re-election, Spencer by name, is a very objectionable character, and is looked upon by the better part of the profession generally as unfit to be on the bench. He was one of the subscribers to the Tweed statue in former years. The other candidate, Gildersleeve, was nominated in an unfortunate manner by a friend, who put him forward chiefly on the ground of his great skill with the rifle, he being, as was justly observed, "the great American shooter"; but we believe his nomination to be a very good one.

---

The week has been one of activity and wide fluctuations in the Wall-Street markets. Gold fell to 114½, but subsequently recovered nearly one "point." Foreign exchange fell to 4.76 for prime bankers' sixty-day bills, and subsequently advanced to 4.80½. All kinds of securities were strong, and some of the speculative "fancies" advanced 6 per cent. The rates for demand loans advanced to 5 and 6 per cent. The explanation of these changes is, in respect to gold and foreign exchange, that some of the large holders of gold, anticipating a considerable increase in the supply here, sold what they held, and, others following, the sales became general. The actual addition to the supply consisted of receipts of about $1,750,000 from California and $500,000 from Europe. The Treasury began the prepayment without rebate of the November interest Monday, which, however, has as yet added less than a million to the previous stock. This interest amounts to between $11,000,000 and $12,000,000; of this $4,000,000 is on registered bonds. As most of the remaining $8,000,000 coupon bonds are held in Europe, and as the Syndicate have secured a good part of the coupons on them, and can use them to pay for new fives, it is doubtful if much gold will be paid out here on account of coupon bonds. The rise in foreign exchange is explained by the fall in the lending rates for gold. It is safe to say that the present and prospective supply of gold is not large enough to prevent a recurrence of high rates for gold later in the season. It is likely, however, that exchange will then be depressed by reason of the excessive supply of bills drawn against the export of cotton, and

with exchange depressed from this cause the importation of gold will be safe. The value of the greenback dollar during the week ending Saturday ranged from 85.65 to 87.14.

Cotton is coming forward rapidly; the receipts at the ports during the past week were 147,345 bales, which is a much larger amount than was received in the corresponding week of any of the past five years. The movement of grain has been somewhat retarded by the position which the railroads have taken in the matter of freight rates; they have already made two advances, and threaten more. Should they carry out their policy, exports of grain would inevitably be diminished and great injury would be done the trade of the country, for everything now depends on an early and successful marketing of the bountiful crops produced during the past season. At the Stock Exchange, the rise in prices was due primarily to the change of front by leading speculators, who had for several weeks been laboring, and with success, to induce a large volume of speculative sales. The purchases to cover these sales started and supported the rise during the week. The advances in railroad freights of course helped the movement, as did also the discovery that many of the statements on which stocks had been depressed were misrepresentations. This turn in speculation changed the call-loan market, and brought Stock-Exchange rates up to those of the banks—which, as a rule, have been lending during the past season comparatively little on stocks. As was indicated as probable, the Bank of England again advanced its discount rate, making it four per cent., or double what it was three weeks ago.

The mercantile agency of Dun, Barlow & Co. have issued their statement, showing the number of failures during the first three-quarters of the year to have been 5,334, with liabilities of $131,172,503—figures largely exceeding those of previous years. What is noteworthy about this is that more than one-half the entire amount was furnished by States in which manufacturing is the chief interest. The *Daily Bulletin* has been collecting some statistics with regard to what is known technically in finance as "the bottom," from which it appears that the process of "reaching" it is going on more vigorously than ever. Cotton is now a fraction lower than it was before the war; the wages of the principal classes of factory employés are now fully as low as they were in 1860; wool at present is even lower than in 1860. It looks from this, the *Bulletin* says, as if the bottom, which we have all been hoping would loom in sight before long, has at last been reached, and as if the "process of recovery" must now set in; as if the prices of labor and materials had now reached a normal state, and cautious men were hardly warranted in waiting for a further decline as requisite to recovery; and that as values have now readjusted themselves the cautious man had better begin producing and selling as fast as he possibly can. We sincerely hope this may be so, though some doubt has been thrown upon it by some recent speculations of the *Times* on the depression of real estate on the Hudson, showing it to be caused by the absence of primogeniture in this country. In all financial speculations about the "bottom" and the "readjustment of values," there is the difficulty that no one has ever seen "the bottom," and therefore no one can recognize it when he sees it again. No one knows what the "normal state" of prices is, and no one therefore can tell when it is reached; and, curiously enough, the very people who generally insist that the bottom must be reached before the process of recovery sets in, ardently hope, not that after reaching it we may remain there, but that prices will immediately begin to go up, and that we may get to the top as soon as possible.

Both in France and England there is a complete dearth of political news. In England, the papers are filled with reports of church and social science congresses and the speeches of members of Parliament to their constituents. In France, public attention is occupied in the same way, and there has been a tiff between M. Léon Say, the Minister of France, and M. Buffet, arising out of a discourse of the former at a banquet; but it has, after threatening a dissolution of the Ministry, ended in nothing. In Spain, the discussion over the Concordat and the Ultramontane circular to the Bishops still rages, but the truth about the affair is becoming better known, and makes it clear that Canovas, when he got into power, did lead the Pope to suppose that the Concordat would not be disturbed, and that he was not or need not have been entirely ignorant of the contents of the circular, and ought not, therefore, to have been surprised at its issue. The Carlists are losing ground. Their supply of men is slowly falling off, while the Alfonsists are managing in one way or another to increase the army in the field considerably. The Cortes is to meet some time in January, elected by universal suffrage, and containing one member for every 50,000 inhabitants. The *Economist* publishes some very striking statistics about the progress of Spanish foreign trade, showing what the country might become under a regular and orderly Government. It has increased in volume by nearly one-third in the last twenty years, which have been years of great and almost constant political disturbance. It amounted to $114,150,000 in 1855; last year to $157,016,650. Moreover, in spite of the Carlist war, the revenue receipts of this year come up to the estimates of 1872.

Turkey has "funded her coupons"—that is, half of them—for five years. All American bondholders know what this means. There is a deficit of $25,000,000 in the year's revenue, and it is likely to continue; funding half the coupons will reduce the outlay by about $35,000,000 a year; and thus it is hoped to bring about an equilibrium in five years, if the Turkish Empire last so long. The loss will fall mainly on British investors, and the announcement is producing great depression in London, and has caused further decline in all semi-barbarous stocks. The money market is, however, at last waking up to the fact that it is not vast material resources, but the honest and efficient government, which makes a state a safe borrower. It is expected that Egypt will go next, as the Khedive has been borrowing frightfully, "basing" the debt on the wonderful fertility of the valley of the Nile. The Turkish collapse derives a touch of humor from the fact that it is accompanied by the establishment of a sinking fund, which is to be replenished by the customs duties, the tobacco and salt monopoly, the Egyptian tribute, and perhaps a portion of the sheep-tax. It is curious that the Vizier does not think of an issue of 3-65s.

The Hungarian budget for 1876, as submitted to the diet, is a very gratifying exhibit of the financial policy of the minister Szell. By stringent economy in all branches of his administration, he has been able to fix the expenses for 1876 at 228,000,000 florins, or at about 11,000,000 less than in 1875, while he estimates the total income at 216,500,000 florins. The deficit, which for the year 1875 is reckoned at 21,700,000 florins, is thus reduced to 11,500,000 florins. But this sum will in reality be increased to 16,000,000 florins, owing to an appropriation of 2,500,000 florins for improved cannon, and the creation of a special fund, promising to be an essential feature of M. Szell's financial reforms, which will require an annual interest of 2,000,000 florins. This fund, which is to be raised by a loan, is chiefly intended to guard against a deficit threatening the treasury in the first half of each year, when the demands on it are heaviest, and taxes not easily collectable. Szell proposes an income-tax of 3½ per cent. to do away with 8,000,000 florins of the deficit, while he mainly relies on the balance of last year's loan to cover the rest. He urges the sale of the iron and coal mines belonging to the Government, deferring that of the forests and lands until a more favorable moment; and, finally, advocates the plan, so successfully carried out in Cisleithania, of converting the entire debt of Hungary into rentes. The energetic and straightforward manner of Szell's dealing with unpleasant facts and figures, and the remedies proposed by him, meet with equal favor in Hungary and Cisleithania, which shares in the improved prospects. Securities have rallied considerably on the Vienna exchange, and the outlook in general is more hopeful than it has been at any time since the crash.

## HUMAN NATURE IN FINANCE.

EVERYBODY now admits that we have not seen the end of the contest over the currency. The result in Ohio has probably put an end to attempts to inflate, but in order to get back to specie payments, it is necessary to do a great deal more than refrain from inflating. We must both contract, and accumulate gold, and sell bonds in exchange for greenbacks to be destroyed, and this is sure to be a process to which there will be, as there has been, much opposition. So that the state of the popular mind about financial questions is and will continue to be of great moment until all United States paper is redeemable in coin on demand. This leads us to say a word once more to those who are engaged in the work of informing the popular judgment, as to the extreme importance of the mode of presenting the economical problems now before the country. It cannot be too constantly kept in mind that the phraseology used in discussing these problems, and indeed generally in teaching political economy, is apt to be misleading when addressed to persons unfamiliar with processes of abstract reasoning. For instance, when we say that Political Economy treats of the laws which regulate the phenomena of wealth, we convey to nine out of ten "plain men" an incorrect impression about it, and one which seriously influences their opinions on such questions as the currency. They come to think of the "phenomena of wealth," of the flux and reflux of coin, of credit, of imports and exports, of demand and supply, of price and value, and so on, as if they were physical phenomena with the production of which human action had little to do, but which might nevertheless be regulated by legislation or administration. They therefore do not see why the supply of money cannot be regulated as we regulate the supply of water for a city or hew stone for a building. When you talk of the value of a thing to them, they fancy that it lies either in some inherent quality of the thing itself or in some quality which can be communicated to it by the sovereign power.

What is needed to correct all this—and it is especially needed in a democracy in which some of the nicest economical questions have now and then to be submitted to the popular vote—is the diligent preaching of the fact that Political Economy has really to do, not with things external to man, but with man himself; not with goods or money, but with states of the human mind with regard to goods and money. When a lecturer on finance or any other department of political economy is examining the question of value, for instance, he is probably, in form, talking about gold or silver, or checks or bills of exchange, but he is in reality talking about the condition of men's minds in the presence of certain phenomena; that is to say, about the way they will feel, or think, or calculate when they are brought face to face with certain external facts. When I ask the value of a thing, I really ask, How do men in civilized countries feel about it? How much do they desire to get it? When I seek a measure of this desire, I have to take, not an arbitrary thing of my own invention to which I give a name, but something for which I already know their desire to be also strong, tolerably permanent, and universal. My own notions, therefore, about measures of value, or how they *might* be made, such as Kelley and Butler and Phillips preach on the stump, are of no sort of consequence. It might be well if we could make a standard of value out of paper, leather, ox-bones, or sausages; but the fact is that the matter lies not in the hands of the legislature, but entirely in the mind of the exchanging portion of the human race. The only permanent standard there can ever be is one to which they will attach value on its own account, without reference to what this or that government can or will do to it. What this standard is can only be learnt, not by the vapid speculations of metaphysicians, but by actual experience, or, in other words, by financial history. Interrogating this, we find that all civilized men prefer gold to any other substance as a measure of value, and if you ask them why, they will answer, because they know when they have got gold that they are independent of Kelley, and Butler, and all thrones and principalities and powers, and are secure against all revolutions and wars and panics, and can go to any part of the world and carry their fortune with them without loss or waste. This state of mind, whether wise or foolish, is the ultimate fact of all finance. There is no use in fretting over it or declaiming against it, any more than against the inability of water to run up hill. It cannot be overcome; a man in our day who is engaged in trying to overcome it, is a person more or less demented. He belongs to the small body of the unsound who are trying to discover perpetual motion and the elixir of life. There are such persons, and there will always be such persons, but the press of civilized countries ought to be by this time delivered from the necessity of arguing with them.

If it be said, as it is said constantly, that this view of the mental attitude of civilized men towards the precious metals is contradicted by the extent to which business is carried on through paper, in the form of bank-bills, checks, drafts, promissory notes, and book-accounts—or, in other words, through "Credit"—the answer is that Credit also is a state of mind, and not simply a set of physical phenomena. It is the state of mind which, with regard to other matters than trade, is called mutual confidence, and means simply the disposition of men in society to believe the promises of their neighbors. They believe them when they say they will at a certain date give them so much coin, just as they believe them when they say they will at a certain hour meet them in a particular place, or give them so many bales of cotton. When a man takes the note of a bank, he does simply what a great wholesale house does when it parts with its goods for a three-months bill. He says he is satisfied that he can have coin for the note when he pleases, just as the wholesale house says it feels sure it will have the money for the goods when the bill falls due. The bank-bill or the retailer's draft, therefore, could not serve the purpose of money unless it had a certain state of mind behind it; and what has led the crazy fellows astray who want to do away with a metallic currency altogether, is that as they see the notes and bills and do not see the state of mind, they think that all that is needed to make paper good money is the paper. "As you never draw your gold," they say to the trader, "you do not need it; banish it from your mind, and all will be well." To which the trader replies, that the paper is but a sign of his belief in certain facts; if this belief be destroyed, using the paper as money would be as foolish as trying to move a locomotive by making a puffing noise in the smoke-stack.

We have no doubt that if the part played by the human will in the production of economical phenomena were thus put forward more prominently in lectures, articles, and speeches on economical questions, a far clearer impression of their real nature would be made on a portion of the community which discussions on these topics do not now reach. If it could be got into people's heads that custom-house returns, bank statements, exchange quotations, price-lists, are all records, not simply of commercial transactions, but of the state of mind of some thousands of human beings at various times about various matters to which they are paying the closest attention, as deeply affecting their own welfare, we should assuredly see removed a great deal of the mystery which now surrounds "finance" in the eyes not only of Ungrammatical Plain Men, but even of lawyers, clergymen, and women of education and thoughtfulness, and the rapid disappearance from the public view of the Soft-Money Blatherskite. The wiseacres who are now sitting up at night devising schemes to enable the country to get rid of its debts without paying them, and at the same time do nobody any harm, would also rapidly rest from their labors; peace would at the same time enter into the souls of the publicists who are possessed with the idea that foreign commodities are imported by a few persons who are living beyond their means, and need the warning voice and restraining hand of a Boutwell or a Richardson to check them in their mad career.

There are some words of deep wisdom on this subject in the late report of M. Wolowski to the French Assembly on the monetary convention of the Government with the Bank of France. After admitting that a certain amount of irredeemable paper might be kept

afloat at par with gold—about $60,000,000—without working any *apparent* mischief, he draws attention, in pointed language, to the fact that the dangers or advantages of any system of currency do not appear on the surface, but are to be found in the state of mind which lies behind the currency, and goes on to explain that the whole of the legal-tender bank issues ought to be withdrawn without any similar substitute "on the part of the Government, because it would be dangerous for the state to begin the issue of paper-money; the ease with which such money can be created, even within narrow limits, might carry us further, and in order to reap a small advantage in the present, we should run the risk of a serious danger in the future, for the appearance of success already obtained might lead to an exaggeration of the system. It is better in a country as impressionable as ours is, and as ready to rush down the incline of bold enterprises, to give up an easy means of lightening the budget, than to encounter the risks of a seductive abuse. We must not tolerate even the harmless use of paper money to a very limited amount, for the limit is too weak to resist the pressure of growing demands. . . . Paper money is, as Napoleon I. said, the curse of nations; it is to the morale what the plague is to the physique. Let us take care not to let ourselves be assailed by such a peril."

## THE RED-CLOUD REPORT.

THE most noticeable thing about the report of the Indian Commission appointed to investigate the charges brought by Professor Marsh, has been the indifference with which it has been received. The report has evidently altered no one's opinion about the management of Indian affairs, and relieved neither Mr. Delano nor General Grant from any of the odium which that management has justly or unjustly brought upon them; and even the changes recommended in the Indian policy of the Government by the Commission—many of which are highly sensible—have not excited any discussion either in the newspapers or in any public quarter. The whole report, except so far as it corroborates the charges made by Professor Marsh, and so provides powder for the war upon the Administration, has fallen completely flat.

The report itself is fair enough. The Commissioners seem to have gone to work in a painstaking manner to sift to the bottom all accusations against Indian officials, and they have sifted them, and have thrown a good deal of light upon Indian affairs. Considering the extra-legal character of the enquiry, and the fact that instead of a prosecuting officer with an able staff of assistants to get at the truth, with all the machinery of the criminal courts behind them, and the hope of professional distinction and public rewards to urge them on, there was only on the side of the Indians and the people of the United States a college professor doing work to which he had never been trained, and incited only by the desire to do his duty, and having against him the united force of all the corruption, all the ignorance, and all the prejudice of the "practical men" of the Plains—the results are startling. They may be generally summed up as the removal of the head of one of the Departments at Washington, the dismissal of half a dozen subordinate officials or employés, and the probable removal of the head of the Indian office. Delano, Smith, and Saville, too, it must be remembered, have not been distrusted public servants, whom the Great Father merely wanted an excuse to get rid of, but were regarded by him as indispensable men, who had been tried and found full of all those qualities which were most needed for the maintenance of that policy with regard to Indian affairs—whatever it may have been—that the Great Father has been so steadily pursuing. Besides this, the more important of Professor Marsh's charges are all completely sustained, or, if not sustained, reported upon by the Commissioners in such a way as to show that they were probably true. Saville they declare to be "incompetent," which was exactly what was maintained by the professor; as to the overestimate of the number of Indians at the Red Cloud Agency, the Commissioners say that army officers examined have the same impression, but that it must be considered a matter of "opinion" rather than exact proof—a safe conclusion, certainly, which will probably not alter the belief of the professor, the army officers, or anybody else. The Commissioners exonerate Bosler, the contractor, but they show by his own accounts that he is growing rich on Indian contracts at a rate which is surprising enough to arouse suspicion and demand enquiry. The charge of having at previous times furnished inferior cattle does not seem to us to have been disproved by proof that a herd which the Commissioners inspected was up to the standard. Flagrant frauds were discovered in pork and flour, and also in transportation. On the whole, with Delano removed, Smith under a serious cloud, and a report recommending the removal of the agent against whose administration the investigation was chiefly directed, and of still another agent, as well as the exclusion of three contractors from all further connection with the Government, Professor Marsh must feel that as a "scholar in politics" he has had a considerable amount of success; and, if every one of his charges is not proved, and some of them turn out to have been too strong, he probably consoles himself with the reflection that nine-tenths of the prosecuting officers in the country, even with the courts and the machinery of justice to aid them, seldom get a verdict upon more counts in their indictments than he has done in his.

What, then, is the reason, in view of the externally respectable character of the report and the success of the investigation in unearthing abuses, that the report has fallen so flat and attracted so little attention? The real answer to this question is, we believe, of considerable importance to the Republican party, and it is the very simple one that the Commission was appointed by the very men whose official conduct was to be investigated, and the instructions issued to the court thus constituted were drawn up by the accused themselves. The whole affair was such an insult to the common-sense of the public that it is difficult to write with moderation about it; but the facts deserve to be recalled. Professor Marsh, it will be recollected, brought his charges not merely against the subordinate employés like Saville, but against Delano and Smith as well, and on this account made his application for an investigation to Grant instead of the Interior Department. Thereupon Grant immediately becomes so impressed with the fidelity and worth of Delano and Smith that he at once hands the whole matter over to them, and it is actually Delano who convenes the court, administers the oaths, and draws up the code under which he himself is to be tried. At such performances it is difficult to know whether the public is expected to laugh or to gnash its teeth, but it cannot be expected to await with interest or to treat as final the findings of a court so constituted. The only analogous case which we remember was Connolly's empanelling of Messrs. Astor, Taylor, and Roberts to examine the Ring accounts in this city. The irregularities then charged against Tweed and Connolly were very much the same as those now brought home to the Indian Department—frauds practised on the public through contracts—and it occurred to them that the only complete vindication they could have would be the report of a competent committee of business men that the accounts of the city were correct. Connolly accordingly appointed Messrs. Astor, Taylor, and Roberts, earnestly begged them to convene the court at once, himself produced the evidence and explained it, and, when he thought the examination had gone far enough, adjourned the proceedings and produced the most complete vindication, to the effect that the city finances were not only in admirable order, but, such were the economy and fidelity with which they were managed, that the entire debt of the city would be probably extinguished in a few years.

Here we have this Investigating Commission at Washington reporting that, while they have discovered some irregularities among agents and contractors, the motives and general character of the gentlemen who appointed them are beyond suspicion; while another Commission, appointed in the same way, has recently reported, almost as if they were rehearsing the Tweed farce, that the Indian policy of the President was such a complete success that not only are the civilized Indians making year by year rapid strides in the path of progress, but even the wild tribes among the Rocky Moun-

tains, with whom no means of communication exists, are beginning to show the effects of the atmosphere of reform which had spread over the plains below.

To put the matter in a very few words, the credulity and confidence of the public have been stretched too far, and it is very plain, from the cool way in which this report has been received, that the Republicans have brought matters to a bad pass for themselves. As a general thing, a respectful attention to the excuses and explanations made by any Administration at Washington is due from and readily yielded by the public at large. The machinery of Government is so complicated, and responsibility so divided, that this ought to be so. When, therefore, this readiness to accept reasonable explanations begins to disappear, and to be succeeded by a sullen determination on the part of the public to listen to nothing, to form their own conclusions regardless of the official explanation put forth, and to treat all officials under charges as probably guilty, the party in power may as well make up its mind that there are rocks ahead. The general spread of this sort of temper will, we may be pretty sure in a free country, not be delayed very long after officials begin to make a practice of "reform within the party" by appointing courts instructed by themselves for their own trial and "vindication."

## THE BARINGS ONCE MORE.

THE Philadelphia *Bulletin* has some talk about the attitude of the Barings towards this Government during the late war, apropos of what has recently appeared in our columns on the subject, and declares that, "unfortunately for the *Nation*, it has not hit upon the right period of the rebellion for its history of the Baring transactions, and is therefore either misled itself or is intentionally misleading others." It then proceeds to tell another story about the Barings, which it evidently considers a clincher. We quote it in its own language:

"It was at least a year before the time of which Mr. Ward or Mr. Aspinwall writes when the Government despatched a confidential agent to Europe to purchase cloth for the army. A special credit of $800,000 or $900,000 was opened for his use at Barings'. On his arrival in London he was cordially received by the bankers, and all the usual facilities were extended to him for the prosecution of his mission. His credit was fully recognized, and everything went along swimmingly. Not finding goods to suit him in England, he crossed to Paris, with letters from the Barings to Hottinguer & Co., where he made his purchases and his first shipments, but cautiously provided for the payments only so fast as the goods should be actually shipped. He returned to London to arrange for his remittances to the Paris manufacturers, and travelled up to London from Southampton *on the train that carried the passengers of the captured Trent.* On presenting himself to the Barings, it soon became apparent that a change had come over the spirit of their dream. They were cool, dilatory, evasive, and, after several days wasted in frivolous excuses, they came out with a downright refusal to honor the drafts, confessing their doubts of the stability of the American Government, and adding that they were already overdrawn by about £40,000, and that they would not pay anything on the special credit of £165,000 until this overdraft was settled. By the same steamer, on the same day, and, as we understand, by the same messenger, the demand was made on the Washington Government for the extradition of Mason and Slidell and for the settlement of Barings' balance. Whether this latter was a coincidence or not, we have no means of ascertaining."

Now, we do not know how much or how little truth there is in this tale. But, taking it as literally accurate, we cannot but regard it as something like a piece of self-stultification on the part of our Philadelphia contemporary, for this is what it amounts to: In the fall of 1861, after Bull Run, when the fortunes of the United States Government were apparently at their lowest ebb, the Barings cheerfully granted it a credit of $800,000 or $900,000, and "cordially received" its messenger "and extended to him the usual facilities." A few weeks later events occurred which clearly indicated the breaking out of a war between their own country and the United States. Everybody in England confidently expected it. Had it broken out, not only would an English banking-house have run the risk of losing whatever the United States Government owed it, but its continuing to supply that Government with money for any purpose would certainly have been a criminal offence, for which the partners would have been liable to punishment by the English courts. The Barings, therefore, in declining to continue the credit until the *Trent* affair was settled acted with perfect propriety; and if their messenger went out by the steamer which took the British ultimatum in the case, that was the very vessel in which he ought to have taken his passage. If the *Bulletin* will peruse Wheaton's chapter, "On the Commencement of War, and its Immediate Effects," it will find the chambers of its brain flooded with a strange but wholesome light, and will be prevented from ever again doing anything so ridiculous as calling the refusal of a banker, under such circumstances, to keep up his business relations with a foreign government "an act of disloyalty to his principals."

That our Government took the right view of the matter at the time is shown by the fact that its relations with the Barings underwent no change. They continued to be its bankers, and when the risk of war with England had disappeared, dark as the days were, honored its drafts as before, as Mr. Aspinwall testified. They were discarded nearly ten years later (1870), when the war had been long over, and then not because the Government had acquired any sense of the danger or difficulty of transacting its banking business with a foreign house, but because a mushroom concern started in New York by two obscure foreigners was willing to bribe some of the President's followers into giving them the handling of the public funds, and found them bribable, and our Minister of Finance silent and subservient. The whole story is a shameful one, which no respectable American can read without blushing, and not the least shameful part of it to our minds is the attempt, like this of the *Bulletin*, to provide an excuse or justification for a piece of pitiful jobbery. *Harper's Weekly* thinks that in spite of the appearance of the President's brother-in-law in it, the President cannot be held responsible—we suppose on the theory that to prove his complicity with any bit of corruption we must trace the money into his hands. We do not care to discuss a matter so repulsive. We shall content ourselves with saying that General Grant's attachment to his relatives and devotion to his personal followers are too well known and too persistent to allow us to release him from the operation of the good old rule which makes kings accountable for the character of their courtiers, and judges private men by the company they keep.

## EMPEROR WILHELM AT MILAN.

PARIS, October 7.

WHEN I was in Milan a fortnight ago, it was still doubtful whether the visit of the German Emperor to the King of Italy would take place. It was well known, however, that if the Emperor crossed the Alps he would meet the King at Milan and not go to Rome. The reason of this is obvious: no sovereign has yet gone to Rome since the question of the temporal power was settled by force, and since Rome has become the capital of united Italy. A visit of the two potentates who are carrying on a war against Rome to Rome itself would look too like an insult to the Papacy, and would only raise Pio Nono still higher in the eyes of the Catholic world. The Germans are a practical race, especially the Prussians; they are quite contented with crushing in Germany the power of the Catholic Church. The Falk laws are enough for them; they control now the Catholic seminaries, the education of the Catholic priests, the management of the Church property. These are tangible, solid advantages which the Prussian state has conquered and means to preserve. A visit of the German Emperor to Rome would only be a boastful and vain manifestation; the Catholic subjects of William would be more deeply offended by this want of taste than by the persistent enforcement of the Falk laws. Even the Catholic bishops are getting accustomed and resigned to those laws; but there would be in a visit of the conqueror of Sadowa and of Paris, of the Protestant Charlemagne, to Rome in its present state something which would shock Catholic hearts and Catholic imaginations perhaps for ages to come. "We will not go to Canossa," once said Bismarck at the tribune in one of the happiest outbursts of his easy and terse eloquence. This is what the French call the *cri de l'âme*. The memory of Canossa cannot perish. Now, fancy the Italian and the German sovereigns holding reviews and parading before their soldiers under the eyes of the prisoner of the Vatican. Victor Emanuel has never warred against Rome with any pleasure. He made himself the soldier of the national unity. A great principle, a great necessity, gave him the courage to incur the excommunication of Rome; but, in his heart, he is not the enemy of the Papacy. As he has absorbed in himself all the kingdoms and dukedoms of the Peninsula, he now wishes Italy to absorb the Papacy. During the periods of his greatest difficulties with the Pope, as temporal sovereign, he has always bowed before the Pope as his spiritual chief and ruler.

This must be well borne in mind by those who, all over the world, take a passionate interest in the great struggle against Rome. Italy is imbued, as it were, with Catholic ideas; her artistic glory is an emanation of the Catholic faith. What the Italians desire is a reconciliation of the Church with the new Italy, united under the house of Savoy; and the Savoy cross is still a cross. There is no fanaticism in the Italian religiosity (I can find no better word to express a state of mind which is antagonistic to pure materialism). There are now, and there always have been, in Italy men of

science, rationalists, unbelievers, but they only form an exception. To the immense majority of the Italians religion seems a necessity, an ornament of life and of civilization ; and they do not look at it from a dogmatic point of view ; they are not troubled with fears and doubts ; they are not, I repeat, fanatics in belief any more than in unbelief. They like an easy, fluent, poetical mode of existence, and the Catholic Church has for centuries fed their eyes with marvellous spectacles and their hearts with all the noble and inspiring images of the Old and New Testaments. To argue with an Italian on Christianity is quite useless : they have not the theological *rabies*. Nobody understood this better than Cavour ; he knew well that a duel of the state with the Church would be fatal to his hopes ; he invented the formula, "Libera chiesa in libero stato," which practically means let the Church alone as long as she does not hinder the work of the state, the unification of the land, of the legislation, etc. Go where you like in Italy now, and you see the religious and civil element working harmoniously together. There only remains the dangerous question of Rome ; this is practically settled, and with time a reconciliation of the spiritual ruler of the Catholic world and of the King of Italy will inevitably take place. Such a reconciliation is the wish of every patriotic Italian.

For these reasons it does not seem likely that the meeting of the German Emperor and the King of Italy will result in an offensive alliance against the Papacy. Such an alliance ought to be signed in front of the Vatican, not in the distant city of Milan. That there should exist a defensive alliance of the two sovereigns against what is called Ultramontanism, is quite natural ; this alliance has existed for the last five years, but its objects seem now well exhausted. Italy has accomplished her unity ; she is in possession of Venice and of Rome ; France has no desire to make war for "an idea" ; nothing threatens the crown of Victor Emanuel. Italy has her natural boundary in the Alps ; she is far too wise to engage herself in wild adventures for the sake of a little strip of land, of Nice, of the southern part of Tyrol, or of Trieste. She is isolated from Europe by a most formidable barrier ; and if great wars should rage from the Pyrenees to the plains of Moscow, she would be quite safe behind the Alps. She is in this respect far happier than Belgium, Holland, or Switzerland ; she is not in the path of the great war cyclones. The instinct of self-preservation, in lieu of high political wisdom (and she has never been deficient in wisdom), would teach Italy that her best policy now would consist in preserving friendly relations with all the great powers impartially, in not espousing any of their quarrels, and in adopting an attitude of complete neutrality in all the great struggles of the day. If this is the case, and I believe that all Italian statesmen agree on this point, one hardly sees what can be the sense of the visit of the Emperor of Germany to Italy. There was a time when Italy had much to fear from Prussia. When the Emperor Napoleon III. concluded the hasty peace of Villafranca, his secret reason was, not his horror of blood, or his generosity towards the young Emperor of Austria ; it was the news which had come to him from Frankfort. The Bund was then still in existence, and Napoleon learned that Prussia was exciting the confederation against Italy and France. These times are quite distant ; and few among the most Germanizing Germans would now speak of re-establishing the Teutonic influence or rule in Italy. Some time ago I was looking from the terrace of the Villa Serbelloni, on the Lake of Como, and I overheard two Germans expressing their admiration of the magnificent sight which was under their eyes. One of them said to the other : "Is it astonishing that our countrymen should always have been drawn to this country, and felt a longing for it ?" You will see in Goethe's works the poetical expression of this feeling : "Kennst du das Land wo die Citronen blühen ?" For centuries the German Emperor felt that it was a part of his mission to cross the Alps from time to time, and make himself the armed arbiter of the dukes, the cities, and the Pope of Italy. He represented the great principle of peace and order in a country convulsed by wars, rebellions, and rivalries. There lingers still in the German heart the old feeling that he belongs to a superior race, which has an inalienable right of domination over the effeminate Latin race. But this feeling has no longer any outward and political expression since the *white coats* of Austria were turned out of Lombardy and Venetia, since the vassals of the Empire who lived at Parma, Modena, Florence, and Naples became exiles. Italy is truly free, and the permanence of her freedom has become one of the great interests of the new German Empire.

We can, therefore, only look at the approaching interview as a great show, as a demonstration of a pacific tendency. The Milanese are preparing to receive the German Emperor—who comes to them with an olive-branch in his hand—with the greatest respect. The old houses which dishonored the noble square in front of the Duomo are being pulled down with great energy, so that the German Emperor may see the cathedral in all its glory. The Italians excel in this sort of operatic enthusiasm. What can exceed the beauty of the ceremonies of Rome ? Compared to an Italian *fête*, an English and even a Parisian ceremony seem tame and prosaic. From time immemorial the Italians have lived in the forum, in their public places ; they are all natural stage-managers. Those who saw the night entrance of Victor Emanuel into Venice, after the departure of the Austrians, declare that nothing like it was ever seen before. In Berlin the Emperor can offer little more to his guests than reviews, endless regiments in battle array. Victor Emanuel will be able to show his guest some fine troops, but even the uniforms of his army have something operatic : the *bersaglieri* look like so many Fra Diavolos. Berlin has a magnificent museum, which is becoming richer every day. But where can anything be seen more admirable, more delicious than the "Sposalizio" of Raphael in the Brera ?—this work which was never retouched, and which is, so to speak, the bloom of Raphael's genius when he left the school of the sublime Perugino. A look at the "Sposalizio" alone is worth a long journey. As much can be said of the famous "Cenacolo" of Leonardo da Vinci ; I went to see it again this year. The fresco has not suffered much lately ; the beautiful outlines are still there, and the inexpressible sadness of the head of Christ will for years to come still impress the spectator with curiosity, melancholy, and awe. I would recommend, however, those who admire Leonardo to look in the Brera for the drawing of the head of Christ which was the first idea, the first study, of the famous head of the fresco. There is a slight pink tint on the drawing, which makes it appear almost lifelike. I don't know anything more striking than this extraordinary head, so full of divine suffering, so noble, so superhuman.

I can only speak of the great artistic sights of Milan ; there are in every city of Italy two or three culminating works of art which rise above all the others as Mont Blanc rises over thousands of inferior peaks. Need I mention the famous Ambrosian Library with all its treasures, the frescoes of Luini in the Church of Sant' Ambrogio ? Modern Milan prides itself on its fine palaces, its enormous arcade, where hundreds of people are always congregated before the gay shop-windows or the new statues of Cavour, of Leonardo surrounded by four disciples. I confess that I have but a moderate admiration for these new works, especially for the arcade, which is the pride of the Milanese. We must not forget the Scala, the finest theatre in Italy ; no doubt some great gala representation will take place there, but gala representations have always seemed to me the worst of all ; the interest is too much outside the stage, and the real actors are in the boxes. After all, a ballet is not quite the thing for two stern warriors like Victor Emanuel and William ; the smiles of a *ballerina* have no charm for eyes accustomed to the topography of battle-fields, and even the noisy music of Verdi cannot compete with the sound of drums and the noise of guns.

It is still doubtful whether Prince Bismarck will accompany his imperial master ; if he does not, it will be an additional sign that the interview is to have no political character ; if he does, it will not prove that it has. There seems to be at present all over Europe a desire to put off the evil day, to ignore or postpone dangerous questions. I was reading in a German newspaper a few days ago that the mental state of things between France and Germany was becoming intolerable ; it was like "moral cannibalism." The German newspapers seem to extend to France a hand of peace ; France remains sullen, but she has no desire to raise any unpleasant question. Europe is at peace, and ardently wishes to remain at peace ; sovereigns can come and go, and see each other in opera-boxes or on parade-grounds without much inconvenience. The dogs of war are chained ; and the anxious mothers, who send their sons to the army, may read without too much tremor the details of the approaching interview at Milan.

# Correspondence.

## LEGALIZE THE GOLD STANDARD—THEN REFORM THE GREENBACKS.

To the Editor of The Nation :

Sir : The "great mercy" in Ohio is doubtless a cause for profound rejoicing on the part of all honest men, but the acceptance of it by many of them as a "settlement of the currency question" is rather a discouraging symptom. Ever since that unfortunate day (Feb. 4, 1868) when Congress repealed the only honest legislation it has ever made in favor of specie payments (I mean the Act of April 12, 1866, under which McCulloch was allowed to "retire and cancel" forty-four millions of the legal-tender

debt), a "specie-payment plank" of various degrees of stiffness has formed a regular component part of most Republican political platforms, State and national, and has often been used to build up those of the Democrats. Spite of these fine words, however, a Presidential veto in April of last year was the only thing that prevented the Congressional inflationists from winning a decisive victory, and the present moment finds the nation staggering under a greater load of irredeemable paper than ever before, and pretending to believe that it can be got rid of by a sham "resolution" which names January 1, 1879, as the happy day.

The difficulty, as everybody knows, results from the fact that "platforms" are modelled as closely as may be after the political formulas of the "Latin races," which promise all desirable things in a general, abstract way, but avoid the advocacy of definite "particular measures" for securing them, as being inconsistent with "harmony." Hence, of course, it is that "pronounced hard-money men," like Blaine and Dawes, can play into the hands of the inflationists by favoring "happy adjustments" and tolerating illegal issues of cancelled legal-tender currency, without exposing themselves to rebuke at the hands of their constituents whose interests they have betrayed. They may favor "a little temporary inflation to preserve the harmony of the party," or may consent to have McCulloch's work all undone because they never advocated his "particular measure" for getting back the gold; but when they talk about "specie resumption" as a general, abstract duty, their voices ring out in trumpet-tones in defence of the national honor and good faith, so that the plain people who cast the votes, though they may have a vague feeling that they are somehow being deceived, cannot for the life of them see where they are to look for more zealous defenders of the right.

Now, since there are half-a-dozen straightforward plans for returning to a specie basis, and since no one of these is so much superior to the others as to make adherence to it alone the test of financial orthodoxy—in other words, since there can be found no one "particular measure" for bringing about the desired result which all the voters who wish for honest money can bind their representatives to favor, what prospect is there that we are ever to see the end of this shuffling and evasive treatment which the invertebrate, "hard-money" Congressional leaders, who have remained "loyal to the great party of progress," have given to the currency question for the last seven years? Presumptuous as may seem the attempt to answer this discouraging question, or to say anything new or worth saying about a subject which ten years' discussion has worn so thoroughly threadbare, I yet venture to suggest that there *is* one act of legislation which all friends of honest currency ought to favor, and which they *might* all be persuaded unitedly to insist upon, since in one form or another it must ultimately find a place in every effective plan of specie resumption, and since its adoption at the outset would in no way hinder the subsequent adoption of any one of those plans. Thus, suppose at the opening of Congress some fine young radical, with an abundant capacity for fighting, should offer a bill to this effect:

"*Be it enacted*, etc., That for all debts contracted within the limits of the United States on and after the 4th day of July, 1876, the standard coin of the United States shall be the only legal tender; and that all laws conflicting with this enactment be and are hereby repealed."

The passage of such a law would not reform our depreciated currency, nor would it forthwith bring about a hard-money millennium. People would still go on making sales for greenbacks; and the nation, the States, the cities, the private corporations, and the individual employers, would still find it easy to hire plenty of servants who would take their pay in the same substitute for money. The national-bank notes issued after July 4 would become *ipso facto* gold notes, and would have the same relation to those issued before that date as gold would have to the national greenbacks. In fact, the immediate outward effect of such a law, so far as concerns the use of currency, would be hardly perceptible; but its moral effect, in educating the popular intelligence to distinguish between names and things, in pledging the nation to at least take no more steps backward, and in concentrating public odium against all foes of the national credit, would be of incalculable value. Already, to be sure, the courts have agreed to sustain contracts made in gold, and the *Nation* has more than once urged that such contracts should be more generally favored by the parties to large business transactions. Indeed, their universal adoption among mercantile men would be the only alternative to ruin should the inflationists once carry the day. But if, after July 4, 1876, definite "greenback contracts" had to be entered into in each case in order to prevent the creditor from demanding payment in gold or its equivalent, "the boot would be on the other leg," the presumption would be reversed, and the "trouble" which now hinders the making of coin contracts would then help the making of them. As time went on, the large tradesmen would gradually grow weary of wasting the effort required to put the "greenback clause" into their contracts, and would become accustomed to base their plans and their business-talk on the true idea that "greenbacks are worth 85½ to-day" instead of on the delusive idea that "gold is worth 117 to-day." The small traders would not be long in following suit, and ultimately even the "laboring man" would get a firm grasp on the idea. Once let the people of this country get into the habit of using the greenback dollar for just what it is worth—once let the most thoughtless and ignorant of them get into the habit of thinking and talking about it as the equivalent of 85 cents in gold—and not even the most case-hardened demagogue would have the audacity to advocate any plan for "moving the crops" or "equalizing the volume of the currency," by cutting down the value of that greenback dollar to 80 or 75 cents. When the fraud is made popularly comprehensible, it will become impossible. When the people realize what a wretched thing an 85-cent dollar is to effect their exchanges with, they will make haste to supersede it by a 100-cent dollar, and so render their standard of value and their circulating medium once more identical.

Which one of the half-dozen plans for securing specie resumption they will then adopt need not be considered now, but it is certain that they will have no difficulty in the case supposed in concentrating opinion in favor of a "particular measure," and making a vigorous support of the same by Congressmen the "main question" of the latter's political existence. In other words, it seems to me that the Legal-tender Act has so confused the popular distinction between right and wrong, between shadow and substance, as to render it impossible for the public to formulate any correct ideas on the currency question while this disturbing force remains unchecked. Remove this disturbing force, let gold be the recognized standard of value, as in the nature of things it must always be the actual standard, and people will once more see the difference between names and things; but, until they are thus allowed to come to their senses, how can it be expected that they will take anything more than a languid interest in "financial reform"? The average man will continue to think that the greenback dollar is "good enough for him" just so long as he believes that "gold is worth 117"; it is only when you can convince him that his dollar is worth but 85 cents that he will bestir himself to get a better one. But how can you hope to convince him so long as an unconstitutional act is allowed to interrupt the working of a beneficent natural law?

That debts existing in 1862 may be paid in greenbacks has been settled by the Supreme Court's mournfully memorable decision of Hepburn *v.* Griswold in 1870; that debts more recently contracted may be equitably paid in the same medium is disputed by no one; but that debts contracted after a fixed future date (the earlier the better) ought to be paid in gold or its equivalent, except by special agreement to the contrary, is a principle which seems to me to lie at the basis of any practicable plan for regaining our national solvency. Is it too much to hope that all intelligent and earnest friends of an honest currency—whether editors, orators, or "managers"—can be made to join forces on this one simple issue, and carry through a movement for bringing the country back, not to specie dollars, but to common-sense? Is it too much to hope that the *Nation* at least will try to reconcile to this preliminary "particular measure" the friends of the half-dozen other supplementary "particular measures" from which is finally to be selected the one that will really bring about the resumption of cash payments? Hope, however, I feel to be an emotion rather out of place in connection with any discussion of the currency when I think of the letter in this week's *Nation*. If a clergyman of recognized ability, an influential social leader in a flourishing interior city, can look at first principles of finance under such a cloud of fallacies, what *can* be hoped for in the case of the uninstructed "common people"? Your answer to his assertion that "to re-enact that gold and only gold shall be legal-tender is a demonstrable absurdity," is of course sufficient; but I wish he might be persuaded to read the remarks made by Professor Sumner of Yale in his recent book about currency, in demonstration of that fundamental monetary maxim: "Whatever gold there is in the world is enough; for the metals will distribute themselves amongst the nations in exact proportion to their requirements, if there is no interference in the shape of inferior currency."

L. H. B.

West Springfield, Mass., October 16, 1875.

## THE MEASURE OF VALUE.

To the Editor of The Nation:

Sir: Accepting the rôle assigned me by the *Nation* of a harmless and teachable lunatic, I recently ventured the assertion in the *Nation* (No. 537):

"Gold may be serving a use as a measure of value, but not as the only legal-tender."

Condescending to my low estate, the *Nation* replied :

"The little hallucination that lies at the bottom of his [my] difficulty is the notion that he can use gold as a means of measuring the value of an article in any other way than by an offer to sell the article for gold."

From the very next number of the *Nation* (538) I clip the following :

"The value of the greenback dollar has ranged from 85.47 to 85.83 (from 117 to 116½)."

I ask, Does not the editor of the *Nation* here measure the value of a legal-tender dollar by gold that happens to be standing by ? Does he not do this without offering to sell or buy a dollar one way or the other ?

It seems to me that there is a chance of reform in our market quotations. It would certainly be wiser, instead of saying that gold is at a premium, to say that legal-tender is at a discount ; thus recognizing the fact that gold is standing by and serving as a measure, whether we know it or not. I would as soon think of inventing a dodge to escape gravitation, which yields the foot-pound as a unit of value to all mechanics, as to try to escape from the supervision of gold as a unit of value in all commercial transactions. But what is *expedient* as legal-tender is one question. What is *inevitable* as a measure of value is quite another question.

THOS. K. BEECHER.

ELMIRA, N. Y.

[We assure Mr. Beecher solemnly that what we know in this office of the value of greenbacks is supplied by the testimony of veracious persons as to the price which they are on a given day bringing on Wall Street *by actual sale*. We do not go down and test the matter by selling them ourselves, because our informants have no motive for lying to us about it, and are men of good repute. We repeat that gold cannot "stand by and serve as a measure of value" except by being offered by *bonâ-fide* dealers in exchange for the commodities whose value it measures. It is not necessary that the owner should sell or offer to sell an article to ascertain its value, but it is necessary that sales of it, or *bonâ-fide* offers to buy it, or something exactly like it, should be made by somebody. This is not a contrivance of ours ; it is a law of the human mind.—ED. NATION.]

# Notes.

A. WILLIAMS & CO. will issue at once, by arrangement with the city government of Boston, two hundred copies of the 'Celebration of the Centennial Anniversary of the Battle of Bunker Hill,' with an appendix containing a survey of the literature of the battle, its antecedents and results. The editor is Mr. James M. Bugbee. The work contains fifteen heliotype illustrations.——A 'Life of Lord Byron,' by Señor Castelar, and 'The Thrones and Palaces of Babylon and Nineveh,' by Rev. J. T. Newman, are announced by Harper & Brothers.——'Foot-Notes; or, Walking as a Fine Art,' by Alfred Barron, will be published by the Wallingford (Conn.) Printing Company.——J. W. Bouton has in press 'The Story of the Stick in all Ages and Lands,' from the French of Fernand Michel ; the third volume of Thomas Inman's 'Ancient Faiths embodied in Ancient Names' ; and Knight's 'Symbolical Language of Ancient Art and Mythology,' edited by Dr. Alexander Wilder.——G. P. Putnam's Sons have undertaken a series of books consisting of characteristic selections, often of entire papers, from the British Essayists. There will be five or six volumes, the first being made up from the *Spectator*, the second from the *Tatler*, *Guardian*, and *Freeholder*, etc., etc. Mr. John Habberton will edit the series.——The Medico-Legal Society of New York solicits contributions to its library either in money or in books ; the proceedings of medical societies, and official reports of or concerning insane asylums throughout the country, are especially desired. Donors not members will be allowed liberal access to the library, which at present is kept by Mr. R. S. Guernsey, at 150 Broadway, and is likely to have a place beside the general law library of the Equitable Assurance Building.——The most noticeable feature of the 'Proceedings of the American Antiquarian Society at the semi-annual meeting in Boston, April 28,' is a discussion of the Christian name of the Rev. J. Glover, who is honored as the father of the American press for having in 1636 sent out the materials for a printing establishment to Cambridge, in New England. This became the first press set up on the continent, save one at Mexico, and the third on either continent. Glover himself died on the voyage over. Dr. J. Hammond Trumbull proves conclusively, from the results of enquiries set on foot by himself both here and in England, that his name was not Joseph, as has been generally supposed, but Jose or Josse (one syllable).——We are informed from Antioch College that "the reputed head and probably now the sole active member of the Great American Literary Bureau, of Yellow Springs, Ohio," is one William B. Hafner, whose character, mental culture, and ability are what one might infer from his circular. "He has never been a member of Antioch or any other college."——The *Athenæum* states that the introductory essays to the catalogues of the various classes of art-works in the South Kensington Museum, which are "the best-compressed manuals of the respective subjects in existence," will be published separately from the lists of objects at a low price—about a shilling each. They treat of furniture, textile fabrics, majolica, musical instruments, and ivories.——An entertaining book will one day be written upon the curiosities of sale-catalogues, and the chapter in it treating of the autograph dealers' price-lists will not be the dullest. Mr. John Waller, 58 Fleet Street, London, offers for sale, among other rarities, an "A. L. S." (autograph letter signed) of Mme. Malibran to Mr. Bunn, 1 p. 4to. : "I am not capable of singing baby's music," etc., *characteristic specimen*, 5s. 6d. Of Tennyson (Alfred) there is a "small A. L. S." as follows : "Send your clerk as soon as you can, please ; there is no need of further hesitation, and don't let him forget my banking-book. A. Tennyson," 10s. 6d. Of Mr. Emerson (R. W.) there is an 8vo "A. L. S.," 2½ pp., *neat specimen*, 2s. 6d. Washington Irving is represented by an "A. L. S." : "In compliance with your request I send you my autograph. Respectfully your obedient servant," etc., *very scarce*, 5s.——The desire of the Germans to take a moral as well as a political satisfaction in their recovery of Alsace and Lorraine is shown in their renewed researches into the linguistic divisions of the population of the new Imperial provinces. The latest map of their German and French-speaking boundaries is to be found in Petermann's *Mittheilungen* for August 19, 1875.

—In *Lippincott's* for November there is the usual strong proportion of sketches of travel, with and without illustrations. The paper on "St. Augustine in April," by Sidney Lanier, belongs in the former category, and the wood-cuts are very good indeed. It is more historical than descriptive, and Mr. Lanier's poetical licenses in prose are accordingly fewer than usual. He has an agreeable style when it is not surcharged with imagery. Even here his rhetorical-poetical foible of seeing "God in everything" displays itself once too often, in the passage where he speaks of "a morning which mingles infinite repose with infinite glittering, as if God should smile in his sleep." In a former paper of his, also on Florida, similes like this occurred several times, if we remember rightly. Mrs. Rebecca Harding Davis is a much more restrained and artistic writer, and her descriptions in "Qualla" of the natural scenery of North Carolina are excellent in point of taste and effectiveness. Buncombe County, for example, under her touch becomes something more than the shadowy foundation of a successful Americanism, and is likely to be long remembered by the reader as an enviable refuge for the weary. When we fairly reach Qualla, in an adjoining county, the climax, in a literary point of view, is too much like the squirrel-track, running up a tree, in which the proverbial cart-track ended. The story of the small Cherokee tribe which she found there, rather than saw, is certainly a very curious and a very shocking one—in a word, their swindling out of money and land by a white foster-child ; but we are told at the close that they have recovered their land by a suit, and that the Government is taking steps to educate and otherwise civilize them on the spot. Mrs. Davis calls for volunteer missionaries to them, but this seems to be one of those cases in which the experiment might profitably be made of distributing the tribe in small groups through a decent agricultural community, under some sort of supervision, but with intent to put upon them at once the necessity of earning a living, obeying the laws, and, as they acquired property, paying taxes upon it.

—*Harper's* contains no salient article, nor any of unusual merit. Mr. John Muir, the enthusiastic explorer of the sinks and gorges of the Sierra, tells in an unpractised way of more living glaciers, great and petty, than are commonly supposed to exist within the limits of California. Mr. James T. Fields makes Barry Cornwall the string on which to thread divers anecdotes of the poet's contemporaries whom Mr. Fields either met at his house or heard him discourse about ; and portraits of all these celebrities appear in their proper place in the text. Of Mr. Procter himself, who wrote "The sea, the sea, the open sea," it is related that he had rarely been at sea, and had so great a dread of it that he would not even cross the Channel to

see Paris. A letter which Lamb wrote him asks for some verses "Signed Barry C——" for a young lady's album. "They need not be very good," adds Lamb, "as I chiefly want 'em as a foil to mine." The paper on "Butter and Cheese" describes the process of cheese-making in factories, an American industry whose development is at least as creditable as that of any which has dictated our tariffs.

—The tributes to the memory of Mr. Frederick Hudson which have been widely published during the past week, recall the recollection of the "good old times" of journalism, when the New York press was in the hands of the founders of its present greatness and prosperity; when Bennett was the editor and proprietor of the *Herald*, and used to announce, for the benefit of his readers and the public, his own horsewhippings with sensational head-lines. Mr. Hudson was unfortunate enough to fill the position of Bennett's managing editor. If we were to say that the memory of having once been the employé of the most unscrupulous newsmonger that ever conducted a paper must be very bitter to any man who has any sensitiveness or feeling left, we should probably say what nine-tenths of the journalists of any self-respect would feel to be true; and it is curious to observe that the system of posthumous puffing can be carried so far that this fact should now be brought forward by the eulogists of Mr. Hudson as the brightest feather in his cap, and that yards of editorial should be wasted in glorifying him for having filled a position which required for the fulfilment of its duties the daily divestment of self-respect and of all the qualities which make life worth having. Mr. Hudson was, we have no doubt, a good managing editor of the *Herald* at the time when the *Herald* could be caricatured as the *New York Sewer*, and he no doubt faithfully performed the duties of his place. He was, however, a man without education, and with little or no literary ability, as those know who have taken the trouble to look into his very badly done 'History of Journalism.' He was, in fact, a man whose death was not of particular moment, and whose obituary might have been compressed into a single line. But when it is treated as the demise of a great and good man, and calls out as much criticism and discussion as if he had been an illustrious judge or great general, we must, in the interest of common-sense and historical truth, protest, however feebly.

—Now that science neglects nothing which will illustrate the history of man, it behoves scientists to be careful as to their authorities and wags to be merciful in their demands on human credulity. Our readers will doubtless recollect the currency obtained a few years ago in both hemispheres for a wild story of subterranean chambers opened in the excavations made for the St. Louis bridge. Some weeks since we observed in a Western paper a burlesque account of a cave discovered on the upper Mississippi, so grotesque in its details that the joke appeared too broad even for its object. Yet in so grave a periodical as the London *Lancet* of October 9 the story comes back to us treated with all seriousness. How far it has been disseminated it would be difficult to say, for the *Lancet* gives the *Union Médicale* of Paris as its authority for the statement "that in an island in the Mississippi a human skeleton has been found supplied with a wooden leg. The latter was fixed to the trunk with leather straps and some bronze-looking metal which had turned fossil," and it adds the sage remark: "Thus it would appear that oak as well as metal were [*sic*] used in prehistoric times." In the next editions of the researches of M. Lartet and Sir John Lubbock and Mr. Tylor we shall look to see extensive deductions drawn from this "fossil" metal and this "prehistoric" leather.

—The importance of the subject warrants a second reference to the Report on the cholera epidemic of 1873 in the United States, already briefly noticed in our columns. This, technically Executive Document No. 95, Second Session, is a work of more than a thousand pages, brought about by a joint resolution of the Forty-third Congress calling for the collection of all facts of importance relative to that epidemic, "with a view to the prevention or limitation of future outbreaks." The Supervising Surgeon of the Marine Hospital Service, Dr. John M. Woodworth, contributes a brief essay connecting the mercantile marine, especially the emigrant ships, with the importation of the disease, and insisting upon its possible prevention and the importance of an intelligent quarantine. His subordinates' papers he transferred to Dr. Ely McClellan, of the Army, by whom they were used in conjunction with those sent him directly by the writers. Dr. McClellan's report, in its seven hundred pages, based on the details of more than seventy-three hundred cases, gives a history that for all practical purposes is complete of the epidemic of 1873, which expended its force in the Mississippi Valley; and also traces the travels in Asia, Europe, and North America of the cholera epidemics that have visited this country. It is illustrated by many maps and plans. The foreign history of cholera is by Dr. John C. Peters, of this city, a well-known investigator of the subject, who also supplies a curious résumé of the history of the disease from before the Christian era to the famous Indian epidemic of 1817. Dr. McClellan believes firmly in the infectiousness of cholera through the ejecta of the sick; and although giving verbatim the antagonistic papers, his work is an argument, and a successful one, in favor of the limitation of the disease by neutralizing its active causes as they escape with the morbid discharges. He attaches no importance to the geological formations of infected localities, he does not assent to the ground-water hypothesis of Pettenkofer, but believes that unsanitary reception-beds favor its spread; he has little to say as to treatment, and his views as to the essential pathology of cholera are not likely to receive from physicians universal assent; but he has rendered the public most valuable service by tracing and plainly describing the from-man-to-man progress of the disease, and its possible arrest by simple but effectual disinfection. A few typical illustrations (*vide* pp. 132, 306, 315, 357, 441), that space forbids us to transcribe, would bring these truths plainly before every intelligent reader. Dr. McClellan does not believe that the cholera originates out of India, and consequently insists upon its importation being necessary before it can occur in America. To prove in this particular instance the negative that it did *not* originate *de novo* in New Orleans is impossible. But he has made as fair a case of probabilities as have his opponents, and a practical lesson from the whole is the value of enlightened quarantine. Unfortunately, Dr. McClellan does not appear to have had the time, or to have taken the time, to condense his ideas, and he shows an occasional emulation of the superfluous adjectives of the Southwest. A much graver fault is his almost uniform failure to cite references when he appeals to authors. It is impossible to verify one in ten of his authorities, because there is no clue but the bald name. Dr. Peters, however, writes pleasantly and to the point, and always gives title and page when he draws from others. The general index, which should double the usefulness of the work, is simply wretched. A bibliography of cholera, comprising about ten thousand titles, prepared by Dr. John S. Billings, of the Army, occupies the last three hundred pages. Completeness is disclaimed in a prefatory note, but it is great in extent and in the lucidness of its arrangement, and is probably unparalleled. It is at once a magazine of universal cholera literature for the student and a monument to the erudition of the editor.

—In the delightful 'Book-Hunter' of John Hill Burton there is much playful satire against the Grangerite, "whose peculiar glory it is to have his books illustrated," which consists in inserting in or binding up with them portraits, landscapes, and other works of art having a reference to their contents. "He is the very Ishmaelite of collectors—his hand is against every man, and every man's hand is against him. He destroys unknown quantities of books to supply portraits or other illustrations to a single volume of his own." In France, whose literature contains many volumes of memoirs and familiar correspondence which lend themselves readily to the illustrator, the art has been carried to higher cultivation than with us, greatly facilitated of late by the growing popularity of etching. M. J. Seurin has prepared a 'Manuel de l'Amateur d'Illustrations' (Paris: Adolphe Labitte; New York: J. W. Bouton), in which he attempts to describe, under authors' names, all line-engravings, etchings, and woodcuts, which, either singly or in series, may appropriately illustrate their works. He also gives a list of all the engraved portraits of each author; for instance, of Voltaire there are fifty-four, of Molière and of La Fontaine fifty-eight. M. Seurin only knows of eight portraits of Shakspere—a number ludicrously less than the actual count; there was, if we mistake not, one volume at Burton's sale containing over a hundred. He also omits all mention of Mr. F. O. C. Darley's illustrations to Fenimore Cooper, although he gives more than one hundred and fifty illustrations of the American author's works by French artists. Absolute perfection in a work of this kind is, of course, impossible. In general, M. Seurin's knowledge of foreign books is surprising, although it is rather a shock to find Sir Walter Scott catalogued under the W's. There would seem to be no end to the embellishment which some books will permit. The author gives sixteen pages to the illustrations made for La Fontaine's works. He says that eight hundred portraits can easily be collected for Saint-Simon's 'Memoirs,' and that he himself has added about twelve hundred pieces to Thiers's 'History of the French Revolution.' M. Seurin, who has the proper respect for the mysteries of his art, concludes his preface with the important observation that not every work nor every edition is adapted for illustration, and that old engravings often set off badly a too modern subject.

—A new Austrian university, called the Francisco-Josephina, in honor of the reigning Emperor, was formally opened, October 4, at Czernowitz in the Bukowina, with an address from Stremayr, Minister of Public In-

struction. Concerning the aim and spirit of the university there can be little doubt. It is to be the outpost of western, and especially of German, culture in the semi-Oriental region of the Dniester. Here, where the Poles and Ruthenians of Galicia, the Poles of Russia, the Russians proper, the Roumanians, and the Saxons of Transylvania, meet and jostle one another, is to be the basis of an aggressive movement in the direction of the Lower Danube. The new university is also a flank attack upon the ancient university at Lemberg (transferred there recently from Cracow), which seems hopelessly given over to Ultramontane and Polish influences. The Francisco-Josephina commemorates the centenary union of the Bukowina with the Austrian crown. Many of the universities of Germany sent delegates, others congratulatory addresses. The number of students for the first year is set down at nearly one hundred and fifty. There are three faculties : of Greek-Oriental theology, of legal and political science, and of philosophy. The Ultramontane press of Galicia having made some improper demonstrations, the landed gentry of the Bukowina, by unanimous consent, presented to Stremayr an address, in which they assured the Emperor of their unabated loyalty and confidence.

—The latest manifestation of the Ultramontane spirit in Germany is worthy of note. It seems that October 3 was to be made the occasion for another "demonstration" at the small pilgrimage-chapel at Oggersheim, near Speyer. Archbishop Ketteler of Menz was invited to preach the sermon. But to do this it was first necessary to get permission from the local authorities. Oggersheim being not only in another diocese, but even in another state—namely, Rhenish Bavaria. The local authorities refused permission, whereupon the Bishop of Speyer telegraphed first to the Minister in Munich, who replied in the negative, and then to the King of Bavaria direct. But without awaiting an answer from the king—indeed, the king never vouchsafed one—the archbishop delivered his sermon. The king is reported to be highly incensed at the entire proceeding. He looks upon the attempt to influence him in person, to the disregard of the ministry, as a breach of etiquette, and upon the sermon of Archbishop Ketteler and the connivance of the Bishop of Speyer as flagrant breaches of public order. The archbishop is out of reach, but proceedings are to be instituted against the bishop.

## TYNDALL ON SOUND.*

THE work of Prof. Tyndall on the philosophy of sound has won for itself, in its former editions, the highest possible recognition among scientific men, not only in England but in other countries. A little more than a year ago, the second edition of this book was translated into German under the special supervision of such eminent investigators as Helmholtz and Wiedemann. In the work before us we have the third revision of the eminent professor's observations under this head. In preparing it, he says, he has subjected the previous edition to a careful re-examination, and, in so doing, has "amended as far as possible its defects of style and matter, and paid at the same time respectful attention to the criticisms and suggestions which the former editions called forth."

In the preface to this publication it is announced by Prof. Tyndall that the new matter of greatest importance which has been introduced into it is an account of an investigation which during the past two years he has been conducting in connection with the Elder Brethren of the Trinity House. It may not be known to all our readers that what we call our Light-House Board at Washington is known in England as "The Trinity House." The title carries us back to the era when monasticism was prevalent in Europe. In its original charter, the body was named "The Masters, Wardens, and Assistants of the Guild, Fraternity, or Brotherhood of the most Glorious and Undivided Trinity, and of St. Clement, in the parish of Deptford Stroud, in the County of Kent." In the year 1836, an Act of Parliament vested in this "Trinity House," as then constituted, the entire control of the light-houses of England and Wales, and gave it certain powers over the lights in Scotland and Ireland. Prof. Tyndall appears to have entered on his duties as "the scientific adviser" of the Elder Brethren shortly after his return to England at the close of his lecturing tour in the United States in the year 1873. In the seventh chapter of the present volume, under the head of "Researches on the Acoustic Transparency of the Atmosphere in relation to the question of Fog-signalling," he gives the processes and the results of some very interesting observations which he has conducted under the patronage of the British Trinity House. The general results of these observations had already transpired, but in the work before us they have received the professor's definite statement side by side with a narrative of the researches from which they have been deduced. It is to this portion of the volume, containing "the new matter of greatest importance," that we purpose to confine our attention in this short review.

The reader who turns to this seventh chapter will find that it opens with an "introduction" professing to give "a summary of existing knowledge" in the matter of fog-signalling. The writer states that while the *velocity* of sound has formed the subject of repeated and refined experiments by the ablest philosophers, "the publication of Dr. Derham's celebrated paper in the 'Philosophical Transactions' for 1708 *marks the latest systematic enquiry into the causes which affect the intensity of sound in the atmosphere.*" And, after making this statement, the Professor immediately adds as follows : "Jointly with the Elder Brethren of the Trinity House, and as their scientific adviser, I have recently had the honor of conducting an enquiry designed to fill *the blank here indicated.*" In order still further to impress on the reader a sense of the magnitude of this "blank," Dr. Tyndall indulges in one or two preliminary references which, he says, "will suffice to show the state of the question when this [his] investigation began." The first of these references cites the opinion of Sir John Herschel to the effect that fogs and falling rain, and more especially snow, had been found by Derham "to tend powerfully to obstruct the propagation of sound." The second of his references is made to what he calls "a very clear and able letter" addressed by Dr. Robinson of Armagh to the British Board of Trade in 1863. In this "very clear and able letter" Dr. Robinson states that sound is the only known means for coping with fogs, but about it, he adds, the "testimonies are conflicting, *and there is scarcely one fact relating to its use as a signal which can be considered as established.*" But Dr. Robinson is clear on one point—to wit, that "fog is a powerful damper of sound."

On the strength of these historical references, Dr. Tyndall ventures the remark that, prior to the investigation conducted by him, the views enunciated under this head by Derham, Herschel, and Robinson "were those universally entertained." It was in order to fill "the blank" indicated by the universal prevalence of such erroneous opinions that *his* enquiry, he says, was set on foot. And his enquiry, he tells us, was begun on the 19th of May, 1873.

Now, it is a matter not only of scientific knowledge, but of public notoriety in this country, that extensive researches on "the causes which affect the intensity of sound in the atmosphere" had been made by the United States Light-House Board long before Prof. Tyndall began his investigations. That he should have chosen to ignore the fact in the body of his present volume becomes only the more surprising when, on turning to its preface, we find that he was, as he confesses, "quite aware *in a general way* that labors, like those now for the first time made public, had been conducted in the United States," and "this knowledge," he subjoins, "was not without influence upon my conduct." If his knowledge of the similar labors conducted under this head in the United States was not, as he acknowledges, without influence on his conduct in giving direction to his researches, it will naturally occur to ordinary minds that this knowledge should also have been "not without influence" on his pen when he was professing to give a summary of the existing state of science on this subject. And when to this statement of the case, as acknowledged by himself, we add that he was made acquainted with the nature and purport of Prof. Henry's explorations on this question, not only "in a general way," but also in a very special way, it becomes still more inexplicable that in defining "the blank" which he claims to have filled by his recent enquiry, he should have disregarded the labors and results of American science, and that too while profiting by the instruments and methods of that science in the very conduct of his investigations. The reader will understand the force of our remark that Prof. Tyndall was acquainted with the researches of Prof. Henry, not only "in a general way," but also in a special way, when we state that a paper by the latter—on the abnormal phenomena of sound in relation to fog-signalling—was read by its author in the hearing of Prof. Tyndall at a meeting of the Washington Philosophical Society, called for the purpose of doing honor to the British savant while he was sojourning in the national capital. And the force of our remark that he has ignored the results of American science in magnifying "the blank" which he describes, while profiting by the instruments and methods of that science in conducting his enquiry, will be understood when we say that the researches of Prof. Tyndall were prosecuted with the help of a steam-syren, gratuitously lent to him by the Light-House Board at Washington, constructed and patented by a citizen of New York, and introduced by Prof. Henry into the light-house system of the United States.

We are now prepared for the next stage of this review. It so happened that while Prof. Tyndall was conducting his researches on sound in relation to fog-signalling, an officer of the United States Corps of Engineers, Major

* 'Sound. By John Tyndall, D.C.L., LL.D., F.R.S.' Third Edition. London: Longmans, Green & Co. 1875.

Elliot, had been deputed by the Light-House Board at Washington to make a tour of inspection in Europe, with instructions to report upon matters relative to light-house apparatus and the management of light-house systems. Major Elliot reached London a few days before Prof. Tyndall began his experiments at Dover, and was courteously invited to be present, but for want of time was compelled to forego the privilege. The results of the English experiments were, however, subsequently communicated to Major Elliot by Sir Frederick Arrow, the Deputy Master of Trinity House (who, we are sorry to say, has since deceased), and were embodied in his report on the "European Light-House Systems," as recently published. The publication of Major Elliot's report was accompanied, in the annual report of the United States Light-House Board for the year 1874, with the following observations :

"Major Elliot gives a detailed account of a late series of experiments by the Trinity House Board on fog-signals. Now, although this account is interesting in itself to the public generally, yet, being addressed to the Light-House Board of the United States, it would tend to convey the idea that the facts which it states were new to the Board, and that the latter had obtained no results of a similar kind ; while a reference to the appendix to this report *will show that the researches of our Light-House Board have been much more extensive on this subject than those of the Trinity House, and that the latter has established no facts of practical importance which had not previously been observed and used by the former.*"

The "appendix" here referred to is from the pen of Prof. Henry, the Chairman of the Board, and details elaborate experiments on sound in relation to fog-signalling, as pursued in the service of the U. S. Light-House Board since the year 1855. Brought to book by this "appendix," Prof. Tyndall asks his readers, in the preface of the present edition of his volume, to bear in mind that "the Washington appendix was published nearly a year after his [my] report to the Trinity House." But in so writing it seems to have escaped his notice that in a subsequent part of this same preface he has confessed that he was "quite aware in a general way" that labors like his own had been conducted in the United States, and that "*this knowledge was not without influence on his conduct.*" And in so writing he forgets, too, that he was an interested listener to the paper read by Prof. Henry on this subject in his hearing while he was in the United States, and before he had turned any attention at all to the phenomena of sound in connection with fog-signals. He states in the body of his book, as already mentioned, that his enquiry under this head began on the 19th of May, 1873, several months after his "general" and his special knowledge of what had been accomplished in this country. And yet, in the face of all these facts and acknowledgments he has allowed his "summary of existing knowledge" on the subject to stand without any recognition of American science in the premises—a suppression which does as little credit to his scientific generosity as to his literary art, for he can be convicted of delinquency in respect of the former by the inconsistency of statement into which he has fallen through a want of dexterity in the latter.

We may, therefore, safely leave the acknowledged record to substantiate the claims of the U. S. Light-House Board when they represent that their researches, running through many years, "are much more extensive on this subject than those of the Trinity House." It remains for us only to consider the second branch of their representation—viz., that the latter (the Trinity House) "has established no facts of *practical importance* which had not been previously observed and used by the former (the U. S. Light-House Board)." In support of this statement we may point to the fact that Prof. Tyndall nowhere pretends to have established by his researches any improvements whatsoever on the methods or instruments of fog-signalling as practised in the United States. On the contrary, he acknowledges that in the choice of fog-signals for British use his "strongest recommendation applies to an instrument for which we are indebted to the United States." He will remember, moreover, that while he was sojourning in the United States he sought and obtained opportunities from Prof. Henry to observe the operation of the steam-syren in the light-house at Sandy Hook. At that time, if not before, he was made acquainted with the progress not only of American science but also of American art under this head. And in view of the fact that, as the "scientific adviser" of the Elder Brethren of the Trinity House, he has counselled them to discard their English horns and whistles and to substitute for them the steam-syrens which have been, for several years, in the use of our American light-houses, it would seem that the second branch of the claim advanced by the Board at Washington stands in as little need as the first of any additional reinforcement at our hands. Bacon rejoiced in the fact that his philosophy was a philosophy which brought forth fruit in the service of man. The progress of American science in this department has been constantly bearing fresh fruit in the interests of commerce and for the relief of the mariner. Daboll's trumpet, an American invention, came to supersede the use of gongs, and bells, and horns, and guns. To-day the steam-syren, an instrument devised and perfected under the direction of the United States Light-House Board, is acknowledged to be without a rival as an efficient fog-signal.

It is no part of our present purpose to institute a critical enquiry into the conflicting views of Professor Henry and of Professor Tyndall with regard to the hypotheses respectively espoused by each for the explanation of the phenomena of sound in its passage through wide tracts of air. Professor Henry believes that the direction and the rate of wind-currents are important elements in the problems presented by the phenomena in question. Professor Tyndall admits that "the well-known effect of the wind is exceedingly difficult to explain," but he insists on making up the fagot of his scientific opinions on the subject at once and for ever without taking the "viewless winds" into his account. He finds a sufficient explanation of all the abnormal phenomena in the assumption of ideal clouds of vapor mingling with the atmosphere so as to disturb its homogeneity, and thereby to quench the body of sound. There is nothing in the working hypothesis of Prof. Henry which excludes any truth there may be in the working hypothesis of Prof. Tyndall. But in the present provisional state of his enquiries on the subject, the former is disposed to question the sufficiency of the explanation adduced by the latter as an efficient cause of all the phenomena in question. With the modesty and reserve of the true physical philosopher, in the present unfinished state of scientific enquiry, Professor Henry waits for the wider knowledge which shall furnish the basis of an assured induction meeting all the requirements of the problem.

Prof. Tyndall, however, is impatient of any contradiction. He admits that he has not verified the effect of wind-currents "by means of a captive balloon rising high enough to catch the deflected wave," but none the less he ventures to propound his hypothesis as the last word of science in the premises. Indeed, he takes great credit to himself for having been able to rise above "the authority" of Prof. Henry in this investigation. He says that in one of his "phases of thought" on the question he passed through the solution "which Prof. Henry now offers for acceptation," "weighed it in the balance," and "found it wanting." And, as if this language were not supercilious enough, he proceeds to indulge in the following self-complacent reflections :

"But though it [Prof. Henry's solution of ocean echoes] thus deflected me from the proper track, shall I say that *authority in science is injurious?* Not without some qualification. It is not only injurious, but deadly, when it cows the intellect into fear of questioning it. But the authority which so merits our respect as to compel us to test *and overthrow all its supports*, before accepting a conclusion opposed to it, is not wholly noxious. On the contrary, the disciplines it imposes may be inthe highest degree salutary, though they may end, *as in the present case, n the ruin of authority.*"

It is impossible to conceive of language more expressive of vanity, conceit, and arrogance than this ascription of intellectual superiority to which Prof. Tyndall treats himself on the assumption that he has laid "the authority" of Prof. Henry in "ruins" upon the question of atmospheric sound. At no time and in no place has Prof. Henry assumed to speak "by authority" on the subject. The man of straw whom Tyndall sets up under cover of Henry's name, in order to exhibit upon it the strength and prowess of his intellectual muscle, is a cheap device of rhetoric which a much inferior man might have disdained to employ in a case like this. The cause of science does not profit by the self-laudation of its votaries, and Prof Tyndall's praises are in the mouths of too many people to render it necessary for him to praise himself at the expense of Prof. Henry or of anybody else.

## THE NORTH AMERICAN REVIEW FOR OCTOBER.

THE most important paper contained in the present number of the *North American* is an article on the "Method and Province of Political Economy," by Mr. Simon Newcomb. Our space does not permit us to discuss the essay as it deserves, but, in brief, what Mr. Newcomb seeks to establish is the existence of what may be called abstract political economy, and to define its limits. That political economy is, or aims to be, a science of some sort, is no doubt admitted ; and its subject is generally agreed to be the production, distribution, and consumption of wealth. But this is so wide a definition that it has always been felt by writers to be without much value. Taken as it stands, it seems to include or involve in some way not only political economy but every branch of science, and a knowledge of all the phenomena of human society, including government. These phenomena, as Mr. Newcomb says, are really the product of a vast number of causes, some of which are always ignored by the economist, and the question is whether he is right in doing so, whether there is an abstract science of political economy like the abstract science of mechanics, and whether here are economical laws as fixed and unalterable as the law of falling

bodies, and which can be separated from their concrete concomitants as readily as the first law of motion can be. Obviously, unless there are such laws we may as well give up economics to Messrs. Carey and Kelley, and admit at once that the so-called science is nothing more than a bundle of empirical rules got together by the sages of any country or state for the benefit of their own fellow-citizens, and that these rules have at bottom no principle whatever. Such a science Mr. Newcomb says there is, and he defines it as that of the operation of those causes which affect the production, distribution, and consumption of wealth, "in so far as they act through human volition." This limitation may seem at first sight trifling, but it is fundamental. The introduction of human volition "brings in causes of a character different from those which act where it is not an element," and the latter class of causes "belongs for the most part to the physical sciences." The state of the weather, for instance, is a powerful agent in determining the amount of wheat or cotton produced in any one season, but the study of this cause belongs to the physical sciences, not to economy. But the prospect of a good crop, "inducing the farmer to sow a large area in wheat, would be an example of the operation of an economic cause, because it would be one acting through the volition of the farmer." It must not be supposed from this reference to volition that Mr. Newcomb countenances "the vulgar notion that the prices of certain things—public securities, for instance—are arbitrarily fixed every morning by the brokers over their coffee"; it is not the independent caprice of individual men, women, and children with which the economist has to deal; it is the volition of mankind or of bodies of men, so far as that volition is determined by the desire of everybody to "employ his productive powers in the way that will yield him the maximum amount of enjoyment." That each man feels this desire and acts upon it, is the fundamental principle of political economy.

The definition of Mr. Newcomb being admitted, the next question is, how are the phenomena of human volition to be studied and brought under the domain of this law? Most people will at once say—in the same way that modern science studies the course of nature. But this is not the fact, for the introduction of the human will separates the science from the physical sciences completely. The fundamental difference is that "the operations of nature depend entirely on "antecedent causes, whereas deliberate human acts are the result of what the older philosophers might have classed as final causes" In other words, some result of the act, or rather some expected result, is itself the cause of the act. "The cause of all the phenomena of political economy is the desire of mankind to enjoy wealth, or the fruits of wealth, and it is the prospect of this enjoyment, and not the antecedent conditions, which is the proximate cause of the efforts of man to acquire wealth." This fundamental distinction between the laws of human action and those of nature is very aptly illustrated by the case of the navigation of a ship in a storm. The motion of the storm-centre takes place without any regard to the ships it may encounter, and a ship drifting in the current moves without any regard to the storm; if, however, the ship is under human guidance, and if her navigators are acquainted with the course of storms, her sails are reefed as soon as the barometer falls. Now, explaining this as a matter of physical science, the observer would have to say that ships reef their sails whenever the pressure of the air rapidly diminishes. But this would be absurd. The rule has not the characteristics of a natural law. The sails are reefed, not in obedience to such a law, but *in order* that certain evils which would result from not reefing them may be avoided; whereas no natural law, so far as we know, operates *in order* that anything may happen.

Without attempting to follow Mr. Newcomb through all the deductions he makes from his fundamental assumptions, we may say that it is from overlooking this essential distinction which the case of the ship illustrates, and which the great writers on the science, like Smith and Ricardo, have felt clearly, though they may not have formulated it, that most of the confusion and error which seem to be creeping into the modern study of the science has come. The modern student, trained as he generally is to purely physical methods, when he undertakes to examine the laws of wealth, is confounded at finding that these laws have not been inductively discovered by a minute accumulation of cases, and immediately says to himself that they cannot be laws at all. He then proceeds, as he supposes, to verify them, by getting together a quantity of cases of economic action, and he finds that in many cases the law does not work; he therefore concludes that it is no law at all. Students of this sort generally begin by demolishing Ricardo's law of rent, by showing that historically it can be proved that the best land has not been occupied first, but colonists have frequently begun with poorer kinds. But the law does not depend on any facts in the history of agriculture; it is a simple deduction from the fact of human volition that men will try to get out of land as great a profit as they can. In the field of practical affairs, the bungling and misgovernment that have been caused by overlooking this fundamental economic fact are incalculable. A legislature, for instance, sees that there are two kinds of currency in a country, one of coin, the other of paper. The latter is by far the most convenient and the easiest to produce. Why, then, should it not pass a law for the issue of a quantity of paper, and at the same time another law requiring people to treat it as of the same value as gold? The answer is, because people will not treat it as of the same value. In fine, the fundamental question of economics is not how, under a given state of circumstances, particular men or bodies of men may be observed to act, but how, under a given state of circumstances, will the universal desire of mankind to get the most enjoyment out of their means influence the action of its will? In clearly formulating the distinction between the method of this science and of physical science, Mr. Newcomb has rendered a great service, and one much needed.

All criticisms of General Sherman have been so overshadowed by the appearance of General Boynton's scathing "companion volume," that less attention will be given to the article on the Memoirs, by Mr. F. W. Palfrey, than it would otherwise have attracted. The author more than earned the right to discuss military affairs in the command of one of the hardest-fought Massachusetts regiments in the Army of the Potomac. He calls attention to the fact, which we have not seen elsewhere noticed, that as a fighter of battles Sherman's "record" for that of a great general is somewhat peculiar:

"A defeat at Bull Run, a defeat at Shiloh, an assault made and repulsed at Haines's Bluffs, two assaults made and repulsed at Vicksburg, a flank attack at Chattanooga, in its immediate results very near a drawn battle, an assault made and repulsed at Kenesaw, three attacks received and repulsed with heavy loss on both sides at Peach-tree Creek and before Atlanta, a little success at Averysboro', and an attack received and repulsed with heavy loss to himself at Bentonville—these make up a fair general statement of the engagements in which he took part."

He thinks General Sherman deficient in tactical genius and the capacity of selecting the best subordinates and making men do precisely what their commander wishes. With the general verdict that Sherman is a great soldier he does not quarrel at all, notwithstanding these drawbacks. The revelations of inaccuracy made by General Boynton are beside the point here, for there has been at least one soldier before General Sherman, admitted by military critics as well as the public at large to have been great, who had less regard for truth than is commonly though unfairly attributed in journalistic controversies to Ananias.

A State University, with the part of the State left out, is, as far as we can make out, what Mr. Charles Kendall Adams would produce as a solution of the problem of the Higher Education, and it might, indeed, be a very good thing if a State could be found which would liberally endow a university, and then leave the administration of its affairs in other and more skilful and honest hands. There is no doubt that in the early colonial days university education was taken in hand in Massachusetts, Connecticut, Virginia, and elsewhere by the State, nor that the multiplication of colleges all over the country since the State system was abandoned is an evil, nor that the concentration of what used to be called "philosophy" in great seats of learning, where intellectual activity is stimulated by numbers, active competition, and generous rivalry, is a good thing, nor that theoretically this concentration is for the interest of the State to effect and also within its power; but, for all that, we fear it will be a long time before any State is found sufficiently enlightened to first endow and thereafter shut itself entirely out from the control of a university; and yet, unless this can be done, even Mr. Adams seems to think the meddling of the State would result in no good; and, as if to disprove his own arguments in favor of State universities, he gives some startling facts from the history of the University of Michigan, the first attempt on a grand scale of the sort. The University of Michigan was modelled in some measure on the Prussian system, was endowed by the State, made a State institution, and to it were handed over the inferior public schools throughout the State. The result is worth noticing. The university had a large Congressional land-grant, which was so well located that about 1830 the value of the lands was estimated at $20 an acre. Of course, the lands were squatted on, and of course the squatters went, just as the university had done, to "the State," or, in other words, the legislature; and, lo and behold, the legislature, instead of doing what they ought as "the State" to have done, did exactly what they wanted to do as average men, and, sympathizing rather with the plain, ungrammatical man who had squatted on the university lands than with the university, they took the lands away and gave them to the squatters. Some of the

lands were released to them on condition that the university should have other lands equally good—there being no others to be had equally good—while later they resorted to a simpler plan, and passed an act enabling the squatters to buy the land worth $20 at $1 25. This outrage was only prevented by the governor's veto, which, as Mr. Adams himself says, "saved the university." By an act of 1840 the university was robbed of $78,000 out-and-out, and, indeed, the principal occupation of the legislature in connection with education during these early years of the university seems to have consisted in "fixing" the price of the lands at some figure below their actual value, and mulcting the college of the difference. In one instance they fixed the price *retrospectively*. In fact, they acted throughout like the Grangers of a later period. "It requires," Mr. Adams says, "but a very simple computation to show that had the policy of the regents never been interfered with on the one hand, and had the legislature never made any appropriation for the university on the other, the institution would now have been far richer than it is." Meantime, the connection of the university with the schools, which was an important part of the scheme, needed money, but, as the State was employed in robbing the university and handing the money to the squatters, it had no funds to attend to this matter, and what Mr. Adams calls these "adverse influences" finally severed the official bond between the university and the schools. These seem to us, we must say, rather singular facts for any one to bring forward who believes in "State universities," as does also the conflict of the regents and the legislature over the professorship of homœopathy. For twenty years a law requiring the appointment of such a professor has been on the statute-book, and the Supreme Court has twice decided that the legislature had no authority to interfere for such a purpose; so the legislature passed a new act making a special provision for a school of homœopathy, thus carrying their point against the university and the Supreme Court together. Mr. Adams's account of the connection between the State and the university is one of the most convincing arguments against "State universities" that we have ever met with.

Besides these articles, this number of the *Review* contains a continuation of Professor Whitney's paper on Surveys, an article by Mr. T. S. Perry on the two Ampères, and a number of book-notices, among which is an excoriating review of Thompson's 'Social Science and National Economy.'

*Trees and Shrubs of Massachusetts.* By George B. Emerson. (Boston: Little, Brown & Co. 1875.)—Tree-lore is no longer confined to the few, and books like this address a large and various audience, or will do so when they become better known. Mr. Emerson's original volume was published twenty-five years ago, "agreeably to an order of the Legislature, by the Commissioners on the Zoölogical and Botanical Survey of the State" of Massachusetts, being a supplement to the Geological Survey of that period, prosecuted under Edward Everett's governorship. It was the most popular report of the series, and the edition was ere long exhausted. When this came to pass—without waiting for the new survey which the State last year came near authorizing but failed to do so—Mr. Emerson, unassisted, set about the preparation of a new edition, devoted several years to it, and to the study of what had been done for the preservation and utilization of forests in the Old World, and for their waste and destruction here in the New; and he has at length brought out this second edition, in two goodly octavo volumes, illustrated and adorned by a large number of well-executed plates. These being interspersed through the pages, unnumbered, and nowhere enumerated, the only way of ascertaining their actual amount was to count them. We find 144 plates, of various kinds and merits. The least satisfying to us are those of *portraitistic* or scenic character, borrowed from the German 'Der Wald' and the very French 'Vegetable World' of Figuier; yet to others these may be the most attractive. Very good, though unpretending, are figures, mainly in outline, contributed by Mr. Isaac Sprague to the first edition, here reproduced. Best of all are those contributed by the same hand to the new edition—original figures of the foliage, flowers, and fruit of many of our trees and shrubs not before illustrated, transferred from Sprague's drawings to stone, and printed in colors. The plates representing our two northern Azaleas, the Roxbury Waxwork (as they name it around Boston), the Virginian Creeper in its autumn dress; the Red Maple, both in vernal and autumnal robes; and the Flowering Raspberry, from which seemingly one may almost shake the mountain dew, are good illustrations of what may be done in this way. Hand-coloring is too expensive, and chromo-lithography can really be turned to excellent account in its place for natural-history illustrations, whatever be its merits or demerits in other regions of art. The letterpress we find is a reprint of the first edition, as to the descriptive part. The popular descriptions seem to have hit the mark.

Mr. Emerson's instructions and appeals for the planting and care of trees, and for the renovation of our woods, wherever practicable and profitable, are worthy of all attention, as his efforts in this regard are worthy of all honor. They began long ago, and have been redoubled now in his later years, in this work and elsewhere. The memorial addressed to the President and Congress by the American Association for the Advancement of Science he took a large part in preparing; and his personal furtherance of it at Washington, of which he makes modest mention in the preface, may yet be fruitful of benefit. It may not be improper to add that the only permanently-endowed arboretum in America—the Arnold Arboretum, entrusted to Harvard University—owes its existence to our author's thoughtfulness and sense of the importance of tree-culture.

BOOKS OF THE WEEK.

| *Authors.—Titles.* | *Publishers.—Prices.* | |

*Debates of Congress Abridged.*

*Forty-third Congress, Second Session* (1874–5).

To which are added the President's Messages and Proclamations, Treaties, a list of Acts passed, and important Reports of Committees. Abridged and compiled by C. H. Jones. 8vo (uniform with Benton's Debates), $5. Sold only by subscription. Sent, carriage free, by the publishers on receipt of the price.

With the favor of the public, a similar volume will be issued for each session of Congress hereafter. Subscriptions are invited for ten volumes, to cover the interval between Benton (who closed in 1850) and the present work.

HENRY HOLT & CO., Publishers, 25 Bond St., N. Y.

NEW BOOKS

JUST PUBLISHED BY

*Little, Brown & Co.,*

254 Washington Street, Boston.

*HISTORY OF NORTH AMERICAN* Birds. New edition. Illustrated by 64 Plates, containing 545 heads of each species in Chromo-lithography, and 593 Woodcuts. The only complete biography of our native birds. 3 vols. (Land Birds), imperial 8vo, $45.

The London *Nature*, one of the highest scientific authorities, says: "Those who wish to become acquainted with American Ornithology had better consult Prof. Baird's volumes."

*EMERSON'S TREES AND* Shrubs of Massachusetts. New edition, greatly enlarged. A Report on the Trees and Shrubs growing naturally in the Forests of Massachusetts. By George B. Emerson. Containing 148 Illustrations, as follows: 47 Heliotypes, 36 Chromos, and 66 Lithographs. 2 vols. 8vo. Price with colored plates, $20; with uncolored plates, $12.

Though this work nominally treats of the trees and shrubs of Massachusetts, it is equally applicable to the Flora of many other States; indeed, all New England, and a greater part of the Middle States. In it are described every important tree or shrub that grows naturally in Massachusetts and in other States of the same latitude the descriptions being the result of careful personal observation.

*PALFREY'S HISTORY OF NEW* England. Vol. IV. From the Revolution of the Seventeenth Century. By John Gorham Palfrey. 8vo, $4.

*BARTLETT'S FAMILIAR QUOTA-* tions. Seventh edition, greatly enlarged. 16mo, cloth, $3.

New and Important Law Books.

*UNITED STATES DIGEST.* Vol. VII. First Series. Letters H I G—J U D By Benj. Vaughan Abbott. Royal 8vo, law sheep, $6.

*THE LAW OF TORTS.* Leading Cases on the Law of Torts. By Melville M. Bigelow, Esq. 8vo, law sheep, $6.

Nearly Ready.

*UNITED STATES DIGEST.* Annual Digest for 1874.

*BISHOP'S COMMENTARIES ON* the Law of Married Women. Vol. II. 8vo.

*POMEROY'S TREATISE ON* Civil Remedies and Remedial Rights. 8vo.

In Press.

*BIGELOW ON ESTOPPEL.* Second Edition. 8vo.

*EWELL'S LEADING AND SELECT* Cases on the Disabilities Incident to Infancy, Coverture, Idiocy, etc. 8vo.

In Preparation.

*A COLLECTION OF CASES CITED,* Considered, Doubted, or Overruled, by the Supreme Court of Massachusetts, with References to the Reports where such cases are noticed. 8vo.

International Review.

NOVEMBER–DECEMBER.

*HENRY WADSWORTH LONGFELLOW AND HIS WRITINGS.* Ray Palmer, D.D.

*ERNST CURTIUS, MULLER, AND MOMMSEN.* Robert P. Keep, Ph.D., late U. S. Consul at Athens.

*CENTENNIAL OF MICHAEL ANGELO.* Prof. Angelo de Gubernatis, Florence.

*GENERAL SHERMAN AND HIS MEMOIRS.* By a Distinguished Military Critic.

*THE NEW YORK STOCK EXCHANGE.* Kinahan Cornwallis.

*THE EXCAVATION OF OLYMPIA.* Prof. Ernst Curtius, Berlin University.

Clubs.—The *International* will be furnished with the *Nation* for $9 20; with *Popular Science Monthly*, $9; with either of the standard $4 monthlies, $8 25. Address

A. S. BARNES & COMPANY,

111 and 113 William Street, New York.

*"THE READER," on page ii, discusses the new work on the 'History of English Dramatic Literature,' in two volumes, by A. W. Ward, just issued from the press of Macmillan & Co.*

# The Nation.

*NEW YORK, THURSDAY, NOVEMBER 4, 1875.*

## The Week.

ON Tuesday elections were held in ten States—Massachusetts, New York, Pennsylvania, Wisconsin, New Jersey, Maryland, Minnesota, Kansas, Virginia, Mississippi. New York State appears, as we go to press, to have gone Republican; the city decidedly Anti-Tammany. In Pennsylvania the currency question brought many voters into the Republican ranks for the purpose of defeating inflation, and the State went Republican by a large majority. Minnesota, whose Republican majority of over twenty thousand in 1872 was reduced last year by half, went Republican by about the same majority. Maryland, Virginia, and Mississippi went Democratic, and Mississippi is to be added to the long list of Southern States emancipated from carpet-bag rule, though Ames still retains the governorship. The election passed off quietly, and the agreement for a fair vote, recently entered into by both parties, seems to have been observed. The Congressional delegation will probably be Democratic by two to one. In Massachusetts the election figures for the last few years have been very perplexing. In 1868, the State went for Grant against Seymour by 77,069 majority out of a total vote of 195,885, and these figures were not materially changed in the Grant and Greeley contest of 1872. In 1873, however, the total vote fell off to 131,543, and the Republican majority fell in proportion to 12,823; last year, on a total vote of 185,720, the Republican majority disappeared, and Gaston was elected Governor by 7,032 majority, the Lieutenant-Governor still retaining the old majority of 12,013. This year the State has gone Republican, electing Rice by a majority not far from that which Gaston had last year, and putting the whole machinery of the State government in the hands of the Republicans. The contest was close and exciting, and the defection of the Prohibitionists, which last year did much to decide it, was this year not so marked. Wisconsin, which last year went Democratic by 10,387, but in 1872 polled a Republican majority of 18,520, has gone back to the Republicans with large gains in the vote. Large Republican gains have been made in New Jersey, but, at this writing, it is difficult to state results with much exactness. The upshot of the Maryland election is unfortunate, as the opponents of the Democrats were engaged in an honest attempt at reform, which the corrupt condition of politics sadly called for.

---

The news of the elections has caused much rejoicing at Washington, where it is received as a vindication of the party, and a proof that it has retained its strength with the people. On the whole, taking the general result of the elections this fall, they must show the Democrats that they cannot count merely upon the disgust of the public with the maladministration of affairs at Washington to give them the ascendancy, but need a definite and honest policy as well; and it is to be observed that the attempt of the Western chieftains to give the party a definite and dishonest policy in the leading States of Pennsylvania and Ohio has met with a signal defeat. Perhaps the balanced condition of parties in which the elections leave the country is the best thing that could have happened, and may bring better nominations next year than we should be likely to have were either party absolutely assured already of success.

---

The elections both in this city and in Brooklyn have been fatal to the respective Bosses of the two places, the Anti-Tammany ticket here having been elected by large majorities, and Boss McLaughlin having been beaten in Brooklyn. Phelps and Hackett are elected by majorities of over twenty thousand. John Morrissey goes to the Senate, and, in short, the alliance between the Republicans and the "short-hairs" has proved a complete success. The gloom in Tammany Hall on Tuesday night, as the returns came in, was very great, John Kelly making a pathetic speech, in which he said he had tried to be a good Boss and give the city good government, and the responsibility of selecting such men as Hackett and Phelps must rest with the people who chose them, and not with Tammany Hall. The audience, however, were impatient, one man crying out, "Put Wickham out," and others, coming probably very near the mark in their explanation of the returns, shouting, "A dollar sixty a day did it." The election, no doubt, puts an end to the first show of an attempt to carry on the government of the city on business principles, for it proves that the Boss needs every cent he can get of the money from the Treasury to bring out the working vote. The "boys" will not vote for a Boss who cuts down their wages when they know he has only to put his hands in the public till for money. We are unable to feel any great enthusiasm over the result, both for this reason and on account of the character of many of the men elected. It shows, however, that the healthy feeling in the community on the subject of secret party management, which was first brought out by the Tweed outrages, is still to be relied upon as an active force in politics.

---

The new Missouri constitution has been adopted by a light vote, though the probabilities are that if a heavy vote had been cast the result would have been the same. Indeed, it is noticeable with regard to the vote on new constitutions in general, that though the number of votes cast may be small, the majority seems to be generally on the side on which public opinion had already declared itself through the press. This new Missouri constitution, as we have before now pointed out, carries the judicial control over the proceedings of the legislature further than any previous instrument, by making the fraudulent tricks in legislation—as, for instance, passing bills without the proper number of readings, etc., etc.—cognizable by the courts. It does away also with special legislation as far as possible, and in fact reduces the legislature in practice to a position which corresponds with that which it already holds in public opinion.

---

Rapid Transit is at last an accomplished fact, or rather there is a certainty of it in the near future. During the past week the Commissioners opened the books of the new company, and the required two millions of capital was subscribed at once. There seems to be no doubt that the subscriptions are *bonâ fide*, and that the lines will soon be built. The history of Rapid Transit has been very much like that of other New York enterprises. It has pushed itself slowly ahead by the force of the wonderful prosperity and wealth and energy of the community, and spite of almost innumerable drawbacks in the way of rivalry of conflicting interests, corruption of legislative bodies, and the adverse influence exercised by the conservatism of the very property-owners who would be benefited by it. The struggles over rival charters and lines were at length brought to an end by the choice of a commission, under cover of whose operations the two most powerful lines, the Greenwich-Street road on the west side of the city, and the Gilbert Elevated on the east side, united; and they have now by their union "captured" the greater part of Rapid Transit, Vanderbilt having obtained control of one important share of it at the upper end of the island. On the whole, the public are much to be congratulated on this termination of the question. It will probably give us better and quicker transit than any public corporation under control of the city would have done.

---

There have been during the week "corners" in cotton, pork, and oats, and the prices of these commodities have been temporarily varied in the interest of one class of speculators, where the contracts

to deliver fell within a given time. There have, however, been no important changes in prices or in trade from legitimate causes. The "corner" in cotton was confined to the New York market, and was rendered possible by the overestimate by speculators here of the receipts at this port during the month of October. The receipts of cotton at all the ports was larger during the week than in previous years, and altogether the cotton movement was such as to give encouragement to those engaged in Southern trade. The gold market, as might be expected, considering the small supply of gold, was more or less deranged, as suited the interests of speculators controlling the stock here. Early in the week gold was scarce, and the price advanced to 116⅝, and finally closed at about 116. The Treasury operations added little to the amount of gold in the market, and bid fair not to raise the holdings of the New York banks above $10,000,000 until the January interest comes out. The Syndicate bankers took about $2,500,000 gold out of the market to complete their settlements (for $14,000,000 New Fives), which was necessary last Thursday. This gold was, however, almost immediately restored by the sale of $1,000,000 that day and by the redemption of called 5-20s; so that the bank statement, which covered the week, showed an increase in specie by reason of the fact that during the early part of the week the specie average was a rising one. The fire at Virginia City was used to strengthen the price of gold, and without doubt it will reduce the supply of bullion for the next few weeks. On Monday the Treasury issued another call for $10,000,000 of 5-20 bonds, interest to cease February 1. The public-debt statement showed a reduction of $4,069,015; the currency balance now stands $9,736,671—a balance sufficiently large to justify the Secretary in selling only $2,000,000 during November, his gold sales being regulated by his currency needs. At the Stock Exchange the tendency of prices has been upwards. Greenbacks have been worth in gold from $86 76 to $85 83. The money market has ranged from 3 to 5½ per cent. for brokers' loans on demand, the uniform rate at the banks having been 5 per cent.

---

A meeting of the stock and bond holders of the Erie Railway has recently been held in London to listen to a report made by Sir E. Watkin, who, a month or two since, made an inspection of the road. He informed his audience in substance that the capital of the road was about $141,000,000; that the road was not making enough money to pay the interest on its bonds and to settle the floating debt, to say nothing about the stock; but that he thought the road might be made to earn enough to "give back to every bondholder his capital, and leave a reasonable hope for the preference shareholders and ordinary stockholders"; that nothing could be done, however, without a plan, which ought to be at once formed. He advised that "not another shilling should be sent out to America till they saw the dawn of hope with regard to better law and a larger diffusion of common honesty"; and for himself declared that "till that dawn became perfect day, he would not be a party to sending out more money." He added that among the assets of the Erie were claims against the Atlantic and Great Western, and he had no doubt there were claims on the other side too; so that, if the two "were not married, they were living together, and the sooner they formed an honorable union, the better." We have not derived a great deal of additional light on the subject of Erie from Sir E. Watkin's speech, but perhaps we shall from the report of the committee appointed on his recommendation. There is one fact with regard to the road which seems to be kept steadily in the background, and that is, as one might naturally suppose, that during all these years of fraud and peculation the road itself has been running down. We believe we speak within bounds in saying that at least $10,000,000 are needed to put the road in a first-rate condition—to alter the gauge of the track and rolling-stock, lay steel rails, build stations, etc., etc. How the union with the Atlantic and Great Western Railroad—itself a hopelessly bankrupt concern—will enable the owners of the road to get this, we do not know.

The leading topic of the day in England is the Turkish bankruptcy, which caused the late panic on the London Stock Exchange in the foreign, and especially in the semi-barbarous, securities. As "the funding of the coupons" amounts practically to a forced loan of about $35,000,000, raised from the holders of certain loans, there is considerable curiosity as to the country on which the loss will fall most heavily. At first it was supposed to be undoubtedly England; but it is now believed that Englishmen have during the past year been working out of the Turkish loans to some extent, so that it is not believed that the total amount of Turkish securities held by them brought in more than $17,500,000 a year in interest. This is now cut down by one-half, so that, if the calculation be correct, English bondholders will lose about twenty-five per cent. of the amount now "funded." Curiously enough, the French and Italians seem to have invested heavily, especially of late, in Turkish securities. The French investors in them are supposed to be mainly small men, who were attracted by the high rate of interest, and the Italians mainly Ultramontane malcontents, who bought Mussulman bonds to show their disgust and contempt for the securities of the new Italian kingdom. The Great Powers have been urged by the moneyed men to remonstrate with Turkey in some fashion or to interfere; but they have all declined, except France, which is said to be carrying on some kind of negotiation, but of course it can result in nothing. A semi-official notice has been published by the Government, saying that it does not well see how it can do anything in the matter, but that the Minister of Finance is engaged in an investigation for the purpose of discovering as nearly as possible the amount of Turkish bonds subscribed for in France, and that the question whether the representations made by the Porte when the loan was contracted do not furnish fair ground for intervention, is under consideration, and that if England and Italy would only co-operate, something might possibly be accomplished.

---

What the financiers who are urging interference ask the Government to do, is to compel Turkey, instead of "funding her coupons," to make now a definitive settlement with her creditors once for all, "scaling the debt" down to the point at which she can certainly pay interest on it, and then giving security by handing over the control of the customs duties and taxes to a sort of European commission established at Constantinople. This suggestion is due to the characteristic way in which the security already given for the loans on which the interest is now stopped disappeared at the very moment it was wanted, and it furnishes, too, an excellent illustration of the value of the process of "basing" loans on things which the creditors cannot get at. The Turkish loans are not only "based on the entire wealth of the people," but some of them, including those on which default has just been made, on particular portions of the revenue, such as the tobacco and salt tax, the customs, and the stamp and license taxes. But, then, these taxes are of course, like "the entire wealth of the people," wholly within the control of the debtor. Consequently, when the creditor calls for the security on which he "based" his loan, he is told that he cannot have it; and the Turkish Government is actually at this moment proposing to pledge things in support of new financial combinations which are already pledged at least once and in some cases twice—so that he is absolutely helpless. In fact, nothing can be more delightful to borrowers than the custom of "basing" loans on things the creditor cannot seize. If it should become general, we should all be able to get as much money as we please, because it would make little difference to the lender what security he took. Another man's land or cow or brown-stone house would do as well as the borrower's own. Some hopes are held out by the *Economist* to the English creditors, owing to the fact that the loans of 1854, 1855, and 1871 are secured by the Egyptian tribute, which amounts to about $3,700,000 annually, and of this the Khedive was ordered by the Sultan to pay into the Bank of England $1,414,350 towards meeting the interest on the above loans. If the Sultan could stop this, there is little doubt that he would now do so,

but it is believed that the Khedive will consider himself bound to continue his payments in the manner prescribed, no matter what the wishes of the Turkish Government may be.

The foreign consuls in Herzegovina have joined in a memorandum declaring, in their opinion, that although the insurrection has been suppressed the Turkish Government is unable to pacify the province, and that the interference or assistance of the Great Powers will be absolutely necessary; and this view is supported in articles in the St. Petersburg press. The difficulty in the way of any real restoration of order now is that a very large body of men have been either burnt out of their villages, or have, before taking part in the revolt, sent their families over the frontier into Servia and Montenegro. 50,000 refugees of this sort are said to be in Montenegro alone, 30,000 in Dalmatia, and as many more in Servia and Croatia. These men have therefore no more attractive occupation before them for the winter than making raids on the Turkish proprietors, or guerilla attacks on the troops. The Sultan's *iradé*, or programme of reforms, inspires no confidence and produces no effect, and, even if the plan is good, it cannot be carried out. It is evident, in fact, that nothing short of a social revolution, which shall change the relations of the Christian peasantry to the soil and deliver them from the tyranny of the Mussulman landlords, will suffice—something, in short, like that which took place in France in 1789, and in Russia after the late emancipation. The only solid result of the insurrection thus far is the bankruptcy of the Turkish Government. The change in the tone of the Russian press is exciting more or less speculation; it was at first coldly hostile to the insurgents; it is now friendly, and even sympathetic.

The Prince of Wales has started on his six months' tour in India, taking at Brindisi a large troop-ship, which has been fitted up as a floating palace. A good deal of interest and importance attaches to the visit, both because he is the first member of the English royal house who has set foot in the Eastern Empire, and because the opportunities of turning him to serious account and making his rôle in the Government look really weighty are not numerous. How much anxiety his goings and comings cause in the mind of the British public has been curiously illustrated by the prayer of Dean Stanley at the service in Westminster Abbey, the Sunday before his departure, that the Prince and his suite might, during his stay in India, uphold the moral repute of England; that "the sensual flag might not be raised"; and that they might be led to seek the things that were "pure and lovely and of good report." In fact, the Dean's language showed that the most he looked for was decent behavior, and that he did not anticipate any advantages to the people of India from a close view of their social and political condition by their future monarch. The Prince's companions are in the main, unhappily, neither savants, soldiers, nor statesmen, but fast young men of fortune, who want to hunt tigers and see the Hindoo girls.

There is nothing new in French politics, except the open revelation of a split in the Republican ranks, which has been long impending. The Irreconcilables, headed by Louis Blanc, have fairly broken away from the Moderates, headed by Gambetta. The former are not satisfied, and demand the good old Republic of 1792, with one big Chamber and no President and no Church, and a policy of Redness of some shade on all subjects. Louis Blanc is troubled in particular by the concession made to the Clerical party by the recent legislation, giving complete liberty of education—that is, permission to all qualified private persons to start schools and universities. He says the Church will use this privilege with such vigor and persistence, and with so much money, that it will give a distinctly ecclesiastical and Ultramontane tone to the youth of the next generation. Gambetta and Jules Simon, on the other hand, have been delivering speeches boasting of the gains made by Republicanism during the past three years, and urging a policy of strict moderation and respect for legality and order, as all that is needed to give the Republic such a hold on the popular mind as to make it not only the actual but the permanent government of France.

The French-American Union Committee propose to erect, with the aid of subscriptions, in this city, a colossal statue next year in the harbor of New York, in memory of the ancient friendship between the two nations. The statue is to be in copper, about a hundred feet high, on a pedestal of about the same height, and is to represent Liberty enlightening the world. It is to be placed on an island in the harbor, where the first blood was shed, according to the circular, in the Revolution, and at night "a luminous aureole, projected from the head, will radiate on the far-flowing waves of the ocean"—or, in other words, it is to be a light-house and Colossus combined. Several excellent names, as those of Henri Martin, Oscar de Lafayette, Paul de Remusat, and Wolowski, as well as that of Laboulaye, are attached to the circular, and we understand that the French sculptor is at work on the statue. With the artistic or scientific questions raised by this proposal we do not propose here to deal, but it may not be amiss to say that one reason why the project has excited apparently so little interest as yet on this side of the water, arises from a doubt in the minds of a large part of the citizens of the United States, both in and out of the city, whether this is the time or place for us to "celebrate ourselves" by putting up a statue at the entrance of New York harbor of Liberty enlightening the world. The recent history of New York has not been, as we know here better, perhaps, than is known in France, the history of Liberty enlightening the world and the progress of law and order, but of monthly and yearly struggles between a community of property-owners and the thieves whom those property-owners elected to govern them; of exorbitant taxes tending year by year to confiscation or repudiation; of judges selling decisions, and politicians votes, and legislators laws; of Liberty trampled under foot by a government of thieves and murderers, and law turned into a burlesque for their protection. The French gentlemen who have devised this statue must remember that though the experiment of free government is in New York an accomplished fact, it has not freed us from many of the wrongs and oppressions that have characterized the despotisms of the past, and that the last statue which we were asked to erect by subscription, and one which called out more popular enthusiasm than this has done yet, was to Tweed.

The Bavarian Ministry is in a small minority in the New Chamber of Deputies, and is undoubtedly unpopular with the masses, who are mainly Catholics; but it is thoroughly anti-Papal and German in its feelings, and has the wealth and the intelligence of the kingdom on its side. It foresaw the possibility of defeat at the late elections, owing to the fierce opposition of the clergy, and tried to strengthen itself by a process of redistricting, which might perhaps be called gerrymandering, and its failure, of course, only increased the rage of the Ultramontanes, who found themselves in a majority of two when the Chambers met. They have, accordingly, succeeded in carrying an address to the King, by a vote of 79 to 76, calling on him to dismiss the Ministry, after a debate so violent that the Liberal members left the House in the middle of it. They base their prayer on the gerrymandering and the alleged subservience of the Ministry to Prussia, and accuse it of the design of surrendering Bavarian independence wholly to the Empire. The King, however, sides with the Ministry, and does not seem much disturbed by the tempest. Parliament is to meet again after adjournment early in January, and if the opposition is troublesome will, it is said, be dissolved. There is little other news of moment from Germany except the Emperor's visit to Italy, and the growth among the Socialists, both common and professorial, of a movement in favor of increased protection for native industry, which has caused a good deal of excitement and alarm among the free-traders, owing to the partial adhesion to it of the North German *Allgemeine Zeitung*, which is Bismarck's own organ. The excuse for this apparent disposition to recede on the tariff question is the same as the excuse here for the "soft-money" movement—"the hardness of the times."

## BOSS GOVERNMENT.

DURING the year 1871, while the rising against the Tweed Ring was in progress, we published several articles on the crisis in the government of this city, which we wish we had space to reproduce now, so striking has been the illustration which they have received from the present struggle against Kelly. Suffice it to say that we then pointed out, at the cost of some obloquy, that Tweed, bad as he was, was not an isolated phenomenon, but the product of a state of things which his overthrow would not fundamentally change; that he was a Boss because the condition of the voting population and the nature of the governmental machinery made Bosses inevitable; and that although he was probably more audacious and corrupt than any Boss who would come after him, he would certainly be succeeded by other Bosses. In the excitement of the time it was, of course, difficult to get anybody to look at the problem of municipal government calmly and rationally, and most people, headed by the New York *Times*, which had fairly won the honors of the struggle, were frantically trying to persuade themselves and their neighbors that the overthrow of Tweed would bring in a new era in city politics, during which "the people would rule" and "the bad men" retire into private life.

In No. 328 of the *Nation* (Oct. 12, 1871) we gave as clearly as we could, in an article entitled the "Boss's Dominions," some account of the social conditions which produced Bosses. At that time the Citizens' Association (a reform association now, we believe, no longer in existence) had ascertained by careful enquiry that the number of voters who could be, and most probably were, reached and controlled or influenced by the agencies which the then Boss had at his command—offices, sinecures, contracts, employment on the public works, untried indictments, suspended sentences, penalties, licenses, ordinances, and so forth—was 60,000, or about half the total voting population of the city. That these agencies were all used unflinchingly there was no question, and they were made all the more effective by the fact, to which we also drew attention at the time, that the more moral, industrious, educated, and public-spirited portion of the community, to whose exertions any system of government would have to owe its purity, was separated from the bulk or, at all events, from a considerable body of the voters by a wide gulf, created by difference of origin, religion, manners, and social ideal.

Now, the overthrow of Tweed was not accompanied or followed by any change in these conditions. The lower stratum of the voting population in this city is to-day what it was in 1871, and bears about the same relation to the upper stratum. There has been no improvement in its morals or manners, and no increase in its political intelligence. Moreover, since Tweed's overthrow there has been no serious change in the methods of government. All the men who have succeeded the Ring in the management of city affairs, from Mr. Green down, believe in and use the processes by which he rose to power—that is, they believe in the expediency and necessity of spending the city revenues in such a way as to secure votes for themselves or their party. This was the essence of Tweed's system. The difference since his time is mainly in degree. Of course, there is no open stealing, but there is the covert stealing involved in making the interests of the taxpayers the second instead of the first consideration in the management of city affairs. In the employment of all labor, the awarding of contracts, the administration of the Fire Department, of the Police, and of criminal justice, Tweed's system has been more or less steadily adhered to. Long lists of suspended sentences figured in the papers during the late canvass as charges against the criminal judges and the District-Attorney, just as they did in the Ring days; and we have had the same stories of "pigeon-holed indictments." The grumbling of a Police Commissioner because the District-Attorney would not do him the favor to let an old burglar go free, which has been revealed in the late canvass, is an incident in all respects worthy of the Tweed régime.

The fundamental fact of Boss rule is, however, the mental and moral condition of a large body of the voters—say half. They are mostly persons whose main interest in life is to make sure of their daily bread for one or two weeks ahead, and they have drifted into New York from all quarters of the globe, and have therefore no feeling in common except a strong desire for a little money. They have little or no comprehension of the elaborate machine by which the city is governed, a compound of three different kinds of legislation and taxation, conducted by a host of officers with a great variety of powers and functions, elected at frequent intervals, for the most part obscure persons selected from three or four times the same number of still more obscure candidates. About "the cause of constitutional government" or of "free government on this continent" they do not care one cent. They are not theorists or doctrinaires, but practical men, to whom all forms of government are good provided their bellies are full and their backs warm, and provided, if their occupations are tainted with illegality, that they are not too closely pursued by the police. There is one essential difference between their views of public men and those of "the property-holders and substantial men" with which everybody, who has had occasion to converse with them during a "rising" against a Boss, must be familiar. The well-to-do citizen, when he is discussing the character of a Boss, always lays great stress on the way in which he (the Boss) got his money. To the Boss's followers, however, this is a matter which possesses no interest whatever; what they concern themselves about is his manner of spending it. So, while the *Times* is thundering away about the Boss's frauds and defalcations, the liquor-saloons are resounding with stories of the way he helped poor fellows who were "in trouble," and of his distributions of coal and flour. About the frauds and defalcations they care little or nothing, and if they turn their minds to them at all, they look on them as legitimate fleecings of the rich. This was true of the Tweed period; it is true, *mutatis mutandis*, of the Kelly period; it will be true five or ten years hence of the post-Kelly period. Besides, even if the moral perceptions of the Kellyites were naturally keener than they are, they would be blunted by their daily experience of the fact that nearly all the other politicians connected officially with the city government do, on a smaller scale and with less vigor and boldness, the things which make up the sum of Kelly's evil repute.

The fuss that is made by the Anti-Tammany people about the number of Irish liquor-dealers who are found on the Tammany General Committee, and whom it nominates for office, is another illustration of their imperfect comprehension of the nature of the situation. Liquor-dealers are the medium, and the only medium, through which political preaching or control can reach a very large body of the voters of this city. The liquor-dealer is their guide, philosopher, and creditor. He sees them more frequently and familiarly than anybody else, and is more trusted by them than anybody else, and is the person through whom the news and meaning of what passes in the upper regions of city politics reach them. The selection of such men as the Boss's advisers and lieutenants, the captains of hundreds and fifties, is therefore not only expedient but necessary. They are the natural administrators of Boss government. The notion that city missionaries or Republican philanthropists, or scholars and gentlemen from Fifth Avenue, can be substituted for them is absurd. Neither the Republican party nor any reform party has at its command any agents or propagandists who can compete with them.

It will probably be said by many that this is merely destructive criticism, the gospel of despair, and that if our view be sound there is nothing left for the better class of New York voters but to quit the city or submit to plunder without resistance or complaint. On the contrary, in politics as in business, the very first step towards successful reform consists in seeing things as they are without falsehood or illusion. As long as the city government is framed, administered, and discussed on the theory that the great body of the citizens are a kind of cross between a jurist and a political economist, who pass their leisure hours in thinking how they can best promote the public welfare, or shed lustre on republican institutions, we

shall have nothing but the disorder and corruption of the last thirty years. Before we can have an upward progress we must have an end of humbug and deception, and an end of the hypocrisy which leads so many lawyers, merchants, editors, and politicians to deny stoutly in public the existence of evils which in private they deplore. We must openly acknowledge that a very large proportion of our voters are ignorant and grossly corrupt persons, to whom the rule of a Boss is entirely acceptable, and who are led into setting it up both by their inability to comprehend any other, and by their overpowering anxiety about their daily bread. To preach, as some of us do, that the reason the Tweeds and Kellys succeed is that their constituents do not know what kind of men they are, and that they would desert them if made acquainted with their real character, is an attempt at imposture of which respectable men ought to be ashamed. It is aggravated, and converted into a positive insult to the public intelligence, when, as has now twice happened within five years, a reform movement directed against the reigning Boss has included vigorous support of blacklegs and gamblers like "Jimmy" O'Brien and John Morrissey. We know of nothing in recent political history more repulsive than the moral exhortations uttered by the Republican party in encouragement of these men.

There are two ways, and two only, in which the reappearance of Bosses can be rendered impossible: one is, the conversion of the municipality into a business, instead of a political, corporation, and the administration of its finances by those who pay the taxes, or believe they pay them. At present they are administered in the interest and virtually under the direction of persons who either pay no taxes, or fancy they pay none, which, for practical purposes, is the same thing. This plan is probably at present impracticable; very likely it will always be so. The other is the simplification of the governmental machinery to such an extent that it will not need professional manipulators, and that attention to its working will not interfere with that close attention to his private affairs which is each citizen's first duty. Such a simplification would render possible and easy the union of the industrious and intelligent classes against the mere proletariat of which New York is becoming the favorite resort, and it would involve, of course, very great concentration of power and responsibility. Since Tweed's overthrow, some approach has been made to it, but very little. Virtually, the city government is, in its main features, what Tweed left it—a mass of complexity, in which it is impossible to tell who is to blame for anything that goes wrong, the understanding of which requires the study of a lifetime, and the management of which necessarily falls into the hands of one man, but without making him amenable in any way to the best public opinion. As long as this is the case, and reform consists in calling him names, and bawling out invective over him every two years, there will never be any improvement worth working for or rejoicing over.

## THE WINDING-UP OF THE FREEDMEN'S SAVINGS-BANK.

WE told in No. 511 of the *Nation* (April 15, 1875) the dismal story of the Freedmen's Savings-Bank, constituting, altogether, as grave an accusation as was ever brought against a political party. We told it, too, book in hand; the facts as we there stated them have never been disputed, and are indisputable. Amid the numerous frauds and defalcations then as now pressing on the public attention, this one attracted but little notice, probably because its victims belonged to the humblest and most helpless class in American society—the freedmen of the South. For the Republican newspapers, the subject was not a savory one; for the Democratic papers, the cheating of the emancipated blacks by their liberators and protectors seemed only worthy of a passing joke—and so the matter passed out of sight and out of mind. But it ought not to be overlooked or forgotten. Although exposure of it at Republican hands is now not to be expected, we earnestly commend it to the notice of the honest men of the Democratic party when next winter in Congress they begin the great work of investigating the dark places in Republican history. Nothing in that history deserves investigation more than this; nothing will repay it better.

Some of our readers have perhaps not forgotten the pitiful tale; how, in 1865, by way of encouraging frugality among the freedmen, a savings-bank was chartered by Congress in Washington for the exclusive use "of persons heretofore held in slavery and their descendants," not as a money-making corporation, but as a charitable institution, whose trustees were charged simply with the duty of receiving the deposits of the class above described, and investing them in "the stocks, bonds, Treasury-notes, and other securities of the United States." The trustees had no authority to establish branches or carry on the business anywhere but in the District of Columbia (and, indeed, Congress could not have given them any such authority), and no authority to invest money in any other way than the above. The trustees had no personal interest in the charter, and the charter reserved a right of inspection by the United States Government, which, however, was never exercised. In fact, it seemed on the face of the transaction as if the Government guaranteed the safety of the deposits, and the depositors—poor, ignorant, and unlettered as they unquestionably were—so understood it.

The business went on swimmingly for five years. The original trustees, who were mostly noted philanthropists, had made way, in the manner provided in the charter, for a body of "successors" who were by no means noted philanthropists. They unlawfully established thirty branches in various parts of the South, and received a large sum in deposits. Having secured it, they got tired of tamely investing it in United States securities, so they got a little amendment to the charter passed in April, 1870, allowing the trustees to invest in mortgage securities and to hold and improve real estate in Washington. It passed without debate, and without a word of objection from anybody except—to his honor be it said—Mr. Simon Cameron. The reason of this silence was that the District Ring was behind the bill, and they were then all-powerful. The investments that were then made almost baffle description. They included not only mortgages on unsalable Southern plantations, on "forest tracts" in the same region, but loans for large amounts on chattel mortgages on furniture (there was one for $50,000), on paintings—we suppose of the Boss school of art—on jewelry, on groceries, and on stock of the "Seneca Stone Co.," of the "Metropolitan Paving Co.," of the "American Seal Lock Co.," and the "Capital Publishing Co." In "securities of the United States" there was found, when the concern was pronounced insolvent in 1874, just four hundred dollars. The miserable truth was then apparent that the Washington Ring and its friends had descended on the earnings of the Freedmen and divided them between them, and the Great Party had nothing to say about the matter. It was too much occupied with the "intimidation" of the depositors at the South.

The bank is now being wound up. There was no respectable reason why it should not be wound up under the Bankruptcy Act, like any other insolvent concern. Machinery for the purpose exists under the Act, and has worked with perfect success in the case of the Washington City Savings-Bank, under a receiver appointed by the courts. Instead, however, of leaving the affairs of the Freedmen's Bank to be settled in this way, the very trustees who have played ducks and drakes with the funds of the institution were allowed, by an Act of June 20, 1874, to nominate three commissioners, who, on approval by the Secretary of the Treasury, became statutory assignees, and are charged with the collection of the debts and the sale of the assets and the distribution of the proceeds among the depositors. These commissioners are allowed $3,000 a year each as their compensation out of the assets, and they are authorized to employ "as many agents as are necessary to assist them in closing up the said company, and to pay them a reasonable compensation for their service out of the funds of the company." The commissioners give a bond to the United States for the faithful performance of their duties, but no depositor or creditor has, under the statute, the right to sue on it. They are not required to make

any report; they are not made accountable to anybody; nobody has the right to inspect or supervise them; and their decisions are final. Two of them are lawyers in large practice, and, we are credibly informed, have never appeared in court in a single case arising out of the affairs of the bank, preferring naturally to employ agents at "a reasonable compensation out of the funds of the company." One of them is already retained on behalf of the United States before the Alabama Claims Commission, at a salary of $10,000 a year. Probably no such machinery for the settlement of the affairs of an insolvent bank was ever before set up. Congress has power to pass a "uniform bankruptcy law," but what is this?

Several questions of law are raised by the matter which we trust will be pushed vigorously. The first is, whether Congress has any right to create a special agency of this kind for settling the affairs of one bankrupt. The second is, whether the trustees are not liable personally for the violation of their charter in establishing branches and in receiving deposits from persons who were neither "heretofore held in slavery" nor the descendants of such persons. The third is, whether colored depositors are not, therefore, preferred creditors of the institution, whose claims must be satisfied before the white depositors can receive anything, and whether the trustees are not in any case personally liable to the white depositors, whose money they received without a shadow of authority. These questions will, of course, not be raised by the three commissioners, and it is a not unnatural assumption that one of the objects of appointing them, with full powers, and without any obligation to report, was not only to prevent their being raised, but to prevent all unpleasant light being thrown on the history of the bank. We trust, however, that the colored depositors have intelligence enough and have found legal advisers honest and able enough to carry their claims into court, and we trust that Congress, when it meets, will consider a rigid and searching examination of the whole matter one of the first and most imperative of its duties.

## THE CAPITAL OF SCOTLAND.

London, October 10, 1875.

THE Highlands are deserted. Chill October has enveloped the mountains and the inland seas and the swollen rivers of Scotland with cold, raw mists, alternating with heavy gales of wind from the Atlantic and the Northern Ocean, and torrents of rain and hail. Englishmen and Englishwomen and all other foreigners have flown, like the swallows, to the sunny South. The Highland lairds who had evicted themselves from their Highland homes during the pleasantest months in the year, are beginning to show here and there, like the rabbits and roe-deer, in their own woods, now that the bracken has turned to a rusty brown and the trees are stripped of leaves. They have come back—these Celtic chieftains—with a balance at their bankers' to tide them through the winter, and they will have some pretty sport during the late autumn out of the leavings of the English sportsmen. Some red-deer hinds to stalk, some wild grouse and black game to kill, and in the crisp, bright, December days, when the thermometer is at zero in the shade but the sun is warm and kind, flocks of woodcocks will be found in the woods along the shore, and will afford some pleasing excitement to the chieftain and his friends.

Like all the rest, I too, who have dwelt in Arcady for six delightful weeks, have turned southwards, and on my way have sojourned for a short space of time in what Mr. Tennyson somewhere calls "the gray metropolis of the north." Edinburgh is admitted by all who have seen it to be one of the most beautifully situated cities in the world. An eminent traveller and still more eminent divine of the present day once told me that there were only three towns on this side of the Atlantic which he considered comparable in situation with Edinburgh. These were Luxembourg, Jerusalem, and Constantinople, and he could not say to which he would give the palm. I should say with little hesitation that, in point of situation, Edinburgh was finer than any of the three. If one could imagine Edinburgh under a Mediterranean sky, instead of the sulky gray or dull leaden atmosphere which habitually surrounds it, and if instead of the hideous uniformity of straight stone houses and Presbyterian ecclesiastical edifices—the least artistic form of building among civilized or uncivilized nations—one could, even in a dream, see the outline of the town broken up, as in most Oriental towns (and in Constantinople conspicuously), by a pleasing variety of architectural structures, I think my verdict would be generally accepted. Any one who has read the 'Life and Times of Lord Cockburn,' Edinburgh's greatest "worthy" during the present century, knows the efforts made by him to protect his native city from the ravages of vandalism, and the small success he had. I do not know that things have much improved since he stopped writing. Hideous new houses now desecrate many spots that he mentions with admiration, and the style of architecture adopted by architects of churches and public buildings has not altered much. A new post-office has been erected, which is a fine massive structure, and they are building an Anglican cathedral, which promises to be successful; otherwise, I do not know that they have done much since Lord Cockburn's time either to damage or amend the natural beauties of the place.

But if externally they have not advanced, I fear from what I learned during my short stay that they have, if anything, retrograded internally. "Scotland is no longer a kingdom," as a well-known Edinburgh lawyer said when they abolished the sinecure office which he had long worthily held, and Edinburgh is no longer a metropolis. At the beginning of this century Edinburgh was to Scotchmen the centre of the universe. Most of the leading Scotch families had their private houses in Edinburgh, just as the leading families of the empire now have their private houses in Belgravia and Mayfair. Each winter during the season—and the season in Presbyterian Edinburgh has always been at its height during Lent—the Scotch aristocracy occupied their houses, and entertained and were entertained in the usual way during a festive season in any other capital. Society was as good in Edinburgh at that time, as fashionable, as intellectual, and as interesting as it was in London, and it was probably much more amusing. Those were the days when Lord Palmerston, and Lord Brougham, and Lord Russell were attending the Edinburgh University; when Sir Walter Scott, Cockburn, Horner, Jeffrey, Lockhart, and Sydney Smith were among the men whom you met and with whom you conversed every day—the time when the *Edinburgh Review* was started and *Blackwood's Magazine* set up to pull it down; when English bards were torn to pieces by Scotch reviewers, and when the Waverley novels were issued at intervals from Constable's printing-office and delighted every man and woman who could read from Land's End to John-o'-Groat's. These royal times and royal men are gone. "The Flowers o' the Forest are a' wede away." Edinburgh, they tell me, has become provincial, and society in Edinburgh is commonplace. There never was much trade or commerce in the town; what little was transacted in that way was always done at Leith, the seaport of Edinburgh, some two miles off. Manufactures—except gas, and they do make very good gas—there are none. Shipping, from natural causes, has no existence, and there are no special industries to bring about an industrial population. And yet Edinburgh has close upon 200,000 inhabitants, and the annual value of lands and heritages within the burgh amounts to something like £1,300,000 sterling. And what, you may well ask, brings all these people to a dead capital, and from what sources do they collect this not inconsiderable sum of money? On what, in short, does Edinburgh thrive and maintain its position as the second richest town in Scotland?

Edinburgh owes its prosperity to three agencies—prestige, law, and education. It possessed, as I have indicated, an intellectual community, and one of the chief attractions of the town is the vague reputation for intellect which has hung around it, like the warm glow of sunlight after the sun has set, since the days of her giants of the early part of this century. This reputation has of late years somewhat faded as the lapse of time increases, and it seems more certain that the wit and worth of the past are buried in a grave from which there is no resurrection. But something there is still to warrant the belief in the intellectual superiority of Edinburgh over all other town communities in Britain. No one who is not deterred by a cold, unfriendly climate would hesitate in choosing to live in Edinburgh in preference to such places as Cheltenham or Bath or Leamington or Brighton. The society in Edinburgh may be provincial in comparison with what it was of old, but it is not provincial in the sense in which the society of these places is provincial. It does not consist of retired tradesmen and half-pay officers, nor of fox-hunting men and showily dressed women, nor of second-rate fashionable people. The Scottish Bench of Judges, the Senators of the College of Justice, as they call themselves, and the Scottish Bar may not number so many distinguished names within their ranks as they once did; but the cadets of many of the old country families still look upon the Scottish Bar as one of the natural fields for their energies, and to be an advocate, as barristers are called in Scotland (one among the many illustrations of the intimacy which of old subsisted between France and Scotland), is no mean ambition even for some of the junior members of the British peerage. And it is not very wonderful that it should be so. I think I am within the mark when I say that there is no profession, except the Irish Bar, which an Englishman, a Scotchman, or an Irishman can enter

that offers so many prizes as the Scottish Bar. There are thirteen Judges of the Supreme Court to administer justice to three millions of people. There is a public prosecutor, a solicitor-general, and five deputy-prosecutors. There are some twenty sheriffs or county-court judges, and about ninety substitute-sheriffs. All these excellent offices, and several that are rather less honorable, though not less lucrative, such as clerkships of court—one of which was held by Sir Walter Scott—are paid by the Crown. The salaries vary from £600 to £5,000 a year. The work is uniformly pleasant and light. The posts are all, with the exception of those held by the public prosecutors, who go in and out with successive Governments, permanent posts, and very nearly all of them are reserved exclusively for members of the Bar. When I tell you that admittance to the Bar costs in one way or another nearly £500; that the number of advocates does not much exceed three hundred; and that there are about one hundred and fifty comfortable posts of one kind or another to distribute among them, you will not find it difficult to understand that the profession is considered a good one, and that the younger sons of even the best among the ordinary good Scottish families do not scruple to join it. From this circumstance the tone of society in Edinburgh is different from what it is in the provincial towns of England. The lawyers are as a rule a good class of men; they have married a good class of women, and have brought up a good class of families. And this brings me to the third agency in the prosperity of Edinburgh. It is the seat of the Metropolitan University, with its celebrated school of medicine—living like the whole town to some extent on the prestige of the past; and there are probably more schools and educational institutions in Edinburgh than in any three towns of its size. People flock into Edinburgh in numbers from all parts of Scotland, and from England too, and from India, in order to educate their families. The University professoriate and the leading schoolmasters amalgamate pleasantly with the legal element in the town, and these conduce not a little to the intellectual character of the society, and to the reputation for wit and worth which, as I have said, still hangs about it, though in fainter colors than of old. But whence comes the wealth of Edinburgh—this £1,300,000 of annual assessable value? These lawyers and professors and schoolmasters are not wealthy; and the people who flock into Edinburgh for the education of their children cannot be numbered among the millionaires. This is true, and the absence of wealth and ostentation constitutes one of the main attractions of the place. Comparatively few people care to keep their carriages; distances are not great, and the streets are tolerably clean. There is not a household in the whole town which possesses or cares to possess a powdered footman—that curious relic of the past who is always lolling about Belgravian door-steps, and turns up from time to time in English provincial towns. People do not vie with each other in expenditure in Edinburgh. The wealthy people are not the professional classes; they are comfortably off, and live a comfortable, quiet life. What wealth there is will be found among the shopkeepers and tradesmen who have made their money out of the professional classes. Socially, they live apart from the latter, or perhaps it may be that the latter take trouble to keep themselves to themselves. But all the power, certainly the political power, is in the hands of the shopkeepers. Not so very long ago the "Parliament House" (the name given to the law courts and their accessories, from the fact that the old Scottish Parliament used to sit where the courts now sit) was omnipotent in all matters political. A leading lawyer used always to represent the city. But these days are past. The power of the Parliament House is waning. The leader of the Bar was defeated some ten years ago by a haberdasher in the old town, and that haberdasher still holds the seat. At the two last elections the Bar was nowhere. The haberdasher brought in a civil engineer with him at the first, and a paper-maker at the last. But these little misfortunes do not affect the happiness of the professional classes in the Northern Metropolis. They solace themselves with the reflection that the constituency of Edinburgh was ever fickle, and that not so many years ago a greater man than even the leader of the Scottish Bar was ousted from his seat, when Thomas Babington Macaulay, the historian of England, and one of the best speakers in the House of Commons, was defeated by a Free-Church paper-maker called Charles Cowan.

# Correspondence.

## THE LATE CHAUNCEY WRIGHT.

To the Editor of The Nation:

Sir May an Englishman be allowed to express the hope that the countrymen of the late Mr. Chauncey Wright will not suffer his writings to lie buried in the obscurity of the back numbers of periodicals, but will collect and republish them in a more permanent and accessible form? Few indeed are the writers whose contributions to periodical literature deserve this honor, though the number of authors who think good to elect themselves thereto is becoming formidably numerous. But that Mr. Wright is one of the few will be questioned by no competent judge, so remarkable is the depth of thought and so exceptional the mental power displayed in his writings. The author of the brief but admirable account of him in your number of the 23d ult. deems him "defective in the shaping faculty, failing to emphasize the articulations of his argument, to throw a high light, so to speak, on the important points." It might, I venture to think, be more justly said of him that he carried out in his literary productions the "principle of parsimony" which he saw exemplified in the works of nature. And herein to my mind lay one of the peculiar charms of his writings. Unlike the majority of critics, he did not write for the "casual peruser" but for the cultivated and discriminating few. He never said more than was sufficient to express his meaning, and if he could wrap up a "world of searching consequences" in a single word, this was for him reason enough for using no more than one word. Hence the pregnant suggestiveness of his criticisms, hence the delightful stimulus they give to thought, the impression they convey of a master-mind putting forth, unconscious of the effort, the precise amount of power necessary for his purpose; the sense, too, of moderation and quiet self-restraint indicative of the store of power in reserve. His last article—that on "German Darwinism"—is an excellent illustration of his merits as a writer. To take a single point: how admirably he indicates in a few brief but adequate sentences the position Bacon occupies among philosophers, and the pre-eminent services he rendered to experimental philosophy. I know of nothing to equal it in all the many treatises, English and foreign, that I have met with on the subject. The keen feeling of pleasure with which I read the whole of that his last essay was exchanged for a feeling of regret as keen when I shortly after saw in your columns the announcement of his sadly premature death, and felt that the delightful chance was gone for ever of lighting upon one of the unmistakable productions of his pen on opening the weekly numbers of the *Nation*.

I remain, Sir, yours sincerely,

E. Hawksley Rhodes.

11 Norfolk Road, N.W., London, England,
October 7, 1875.

[We understand that a collection such as our correspondent suggests is in contemplation.—Ed. Nation.]

## THE QUINCY LIBRARY CATALOGUE.

To the Editor of The Nation:

Sir: The many and very gratifying responses to the notice in your issue of 14th ult. of the catalogue of the Quincy Public Library which have come to me from all quarters, induce me to call attention to an error in it. The writer of the notice, in apparently attributing the work solely to me, does me more than justice, and another less. I wish to remedy this by quoting the following words from the preface:

"The catalogue, both properly as such and in its cross-references and references to contents, is almost exclusively the work of Miss M. B. Merriam, who also prepared a number of the shorter notes."

As Miss Merriam is not only a professional but a most accomplished cataloguist, whereas I am neither, I sincerely hope that she may receive all the credit which, in consequence of your notice, seems likely to accrue to our Quincy catalogue.—I am, etc., Charles F. Adams, Jr.

Quincy, Mass., Monday, November 1, 1875.

## TURKEY.

To the Editor of The Nation:

Sir: The following I find in your paper of this date:

"Turkey has 'funded her coupons'—that is, half of them—for five years. All American bondholders know what this means. There is a deficit of $25,000,000 in the year's revenue, and it is likely to continue; funding half the coupons will reduce the outlay by about $35,000,000 a year; and thus it is hoped to bring about an equilibrium in five years, if the Turkish Empire last so long. The loss will fall mainly on British investors, and the announcement is producing great depression in London, and has caused further decline in all semi-barbarous stocks. The money market is, however, at last waking up to the fact that it is not vast material resources, but the honest and efficient government, which makes a state a safe borrower. It is expected that Egypt will go next, as the Khedive has been borrowing frightfully, 'basing' the debt on the wonderful fertility of the valley of the Nile. The Turkish collapse derives a touch of humor from

the fact that it is accompanied by the establishment of a sinking fund, which is to be replenished by the customs duties, the tobacco and salt monopoly, the Egyptian tribute, and perhaps a portion of the sheep-tax. It is curious that the Vizier does not think of an issue of 3.65s."

This is probably the most successful example on record of the destruction of a once great and powerful empire by that "free trade" which allows foreigners to send their goods, wares, and merchandise into a country at a less rate of taxation than home producers would have to pay if producing the same kind of goods. In a word, Turkey is dying of three centuries of "free trade" with Great Britain. "An issue of 3.65 bonds" would not save her; but will you be kind enough to let your readers know why it is that the *Nation's* specific, "free trade," has not done so? If this nostrum is all its friends claim for it, Turkey should be one of the foremost nations of the world to-day, instead of being just on the eve of becoming the dead man of Europe. H. C. B.

PHILADELPHIA, October 28, 1875.

---

[If any free-trader has ever been so foolish as to maintain that free trade, without regard to the character of the government or the constitution of society, would make a country prosperous and happy, we have never heard of him, and do not believe that any such person exists. "H. C. B." is therefore really combating a creature of his own imagination. Why can our protectionist friends not read, even cursorily, some plain treatise on logic, in its application to politics, and save themselves the trouble of writing such letters as the above? Mr. Mill's chapter, for instance, on the "Chemical Method in Social Science" would surely be sufficient to put anybody on the right track, or at all events keep him off the wrong one, in enquiring into the causes of the failure of the Ottomans as a ruling race.—ED. NATION.]

---

## THE TWEED CASE AGAIN.

TO THE EDITOR OF THE NATION:

SIR: Mr. J. Q. Adams, in his diary of Feb. 9, 1827 ('Adams's Diary,' VI. 233), says: "The Chief-Justice [Marshall] said Judge Peters had written to him to enquire if C. J. Ingersoll's six hundred indictments could not be consolidated." Were not those "six hundred indictments" a series of indictments, in the cases of U. S. *v.* Thompson, charged with fraudulently importing teas? Was it not claimed by the defendant that all the charges, being of the same grade and against the same defendants, should be joined in one indictment; and that it would give the prosecution not only a great and wrongful advantage, but would cruelly oppress the defendant, to try each charge separately? Was there not a general outcry at this supposed attempt to make costs for the prosecution by a false rule of pleading? And what was the judgment of the Court? As I cannot find it reported, perhaps some of your Philadelphia readers may answer. The case is of interest as directly bearing on that of Tweed. X.

---

[We do not know what disposition was made of the case referred to by our correspondent, but in the last volume of Illinois Reports may be found a decision in point as to cumulative sentences. We find the opinion in full given in the Chicago *Tribune* of Oct. 25, from advance-sheets of the volume. Lewis Martin had been indicted for selling intoxicating liquors without a license, to be drunk on the premises where sold. The indictment contained twelve counts. On a trial, the defendant was found guilty, as charged, in each of the twelve counts, and the Court rendered judgment for a fine of $600, and ordered that the defendant be committed to the county-jail for 180 days. The opinion is: "The judgment in this case was fatally defective. The judgment for imprisonment was for 180 days in gross. It should have fixed the imprisonment for a specific number of days on each count on which the jury found the defendant guilty, the imprisonment on the several counts to commence at the expiration of each preceding term of imprisonment. This is the rule announced in the case of People *ex rel.* Manyx *v.* Whitson, 75 Ill. (7th *Legal News*, p. 19). That case governs this. The judgment of the Court below is reversed and the cause remanded."—ED. NATION.]

## DE LUNATICO INQUIRENDO.

DR. WELLS'S OPINION IN CONSULTATION ON MR. BEECHER'S CASE.

TO THE EDITOR OF THE NATION:

SIR: I am not altogether satisfied with your reply to Rev. Thomas K. Beecher in the *Nation* of October 14, under the head of "De Lunatico Inquirendo." Not that I dissent in any degree from any of your conclusions, but because I think that Mr. Beecher needs the *primer* of fiscal economy rather than the advanced text-book. Suppose you therefore allow me to try my hand in answering his interrogatories.

Mr. Beecher says he detects in the general flow of commerce what he is pleased to term "closed circles of exchange," and asks why some currency other than gold may not be used and continue to revolve for ever independent of gold in such circles. To this I reply that I, for one, see no objection to the use of such other currency, under the conditions specified. For example, take the illustrations which Mr. Beecher brings forward; and, *first*, that of the grocer and the milkman, who exchange between themselves groceries for milk-tickets. What objection can there be to their so doing, or why should any one interfere to prevent this little arrangement any more than any other mutually agreeable trade or bargain the grocer and milkman may choose to make? So, in the *second* case supposed by Mr. Beecher—namely, that of the Government issuing notes promising to pay and made receivable for a year's taxes—I can see no objection to that either, further than that, as a general rule, it is better for Government and individuals alike to pay cash down, rather than issue their I. O. U.'s or get trusted. And if the Government wishes to obtain commodities or services, and promises to pay for them in its own notes or in cabbage-leaves, and people are found *willing* to take such notes or cabbage-leaves in exchange, I see no reason for entering any protest against it, or calling on any one to prevent the Government from issuing, on the one hand, or the people from receiving, on the other. The highest right of property is the right freely to exchange it for other property; and the highest attribute of personal freedom is for each person to determine for himself under what conditions he will render service. Thus far, then, there is no disagreement in our respective positions. But when Mr. Beecher goes a step further, and says he is unable to see "any unwisdom or injustice in requiring citizens to recognize Treasury notes [whether the same be greenbacks or cabbage-leaves], which are legal tender to the Government, as legal tender also in the settlement of private accounts," then Mr. Beecher and I walk apart; and it is just here, in my opinion, that Mr. Beecher's mental obscurity about money and legal tender begins, for he seems unable to recognize any broad distinction between "may," or the *permissive* sense, and "must," or the *compulsive* sense, in its application to money. To make this clear let us take an illustration.

Suppose I go on a certain Saturday to Elmira, to hear Mr. Beecher preach. Time hanging heavy while waiting for Sunday to come, I stroll on Saturday evening to Smith's pleasant gambling-saloon to have a little amusement, and being at the same time on "frugal thought intent," I conclude to risk but five dollars for my evening's diversion, and so bet but fifty cents at a time on the green cloth. To enable me to do this, I get a five-dollar greenback exchanged at the cashier's desk for ten red ivory counters, or "*chips*," as they are technically called; and after playing to my heart's content I leave, and Sunday morning finds me at Mr. Beecher's church. (I acknowledge that my conduct is rather inconsistent; but it is not my conduct that we are looking after just at present.) The sermon pleases me so much that at its close, when a collection is taken up to help pay Mr. Beecher's well-earned salary, I determine to contribute; and finding one of those red chips I received in exchange the night before in my pocket, I put it in the hat. When the money comes to be delivered over to Mr. Beecher, he very naturally expresses some surprise at finding this strange-looking visitor nestled in among the bank-notes, the fractionals, the cabbage-leaves, and the milk-tickets, and asks what it all means.

To this I may be supposed to respond that the chip is currency, "revolving perfectly in the close circle" of the faro-bank, and fulfilling within that circle all the offices of money, independently of gold. Mr. Beecher has only to go, after church, down to Smith's saloon, and present the red chip I have given him to Jones, the cashier, and Jones will either allow him to bet with it or, if the bank was not cleaned out the night before or seized by the police, will probably redeem it in a fifty-cent scrip. "But, my dear sir," responds Mr. Beecher, "I am a minister, and I don't want to be seen going into Smith's saloon." I answer: "I suppose it would be somewhat disagreeable to you, but you can give this chip to the milkman, the grocer, or the Government tax-collector to-morrow morning. They understand all about these 'close circles' of exchange; they will take it." "But I am not so certain of that," says Mr. Beecher. "How will they,

any more than I, know what its value is, or whether it will be redeemed in anything else?" "Don't trouble yourself about that matter," I rejoin; "I have fixed all that. I happened to be a member of Congress last year, and after devoting two weeks' earnest study to the subject of finance, I was not able to see, any more than you now are, 'that there is any unwisdom or injustice in requiring citizens to recognize Treasury notes' and gambling chips—the one of which is legal tender to the Government, and the other legal tender in the faro-bank—'as a legal tender also in the settlement of private accounts.' More than this, the ivory chips are prettier than the greenbacks, and more convenient for carrying; and what better device can there be for indicating their difference in value than by a change in their color? They have also in perfection another attribute of really good money, inasmuch as they are non-exportable; and if we take into consideration the number of fights, feuds, and murders that take place in gambling-saloons, I think that we are fairly entitled to claim for the chips that they are 'battle-born' and 'blood-stained.' So I accordingly persuaded the national legislature to pass a law making Treasury notes, gamblers' chips, milk-tickets, and every other instrumentality of exchange which is capable of revolving perfectly in a closed circle, legal tender in payment of all private debts. 'You see it now, don't you, Mr. Beecher?" "I rather think I do," responds Mr. B.; "but at the same time I wish that when you next come to hear me preach, and feel that I have rendered you a service and strengthened you up to further good work in Washington, you would give me something that don't belong to a closed circle of exchange—something that I shall not feel obliged, before accepting, to examine a statute-book, read my Bible, consult the resolutions of the last political convention, or wait the news of an election in Ohio, to decide whether I had better take it, and, if I do take it, how much I can get for it."

Seriously, however, the trouble with Mr. Beecher and a good many other persons is, that they fail to recognize that "legal tender," whose father is Government and whose mother a Statute Law, is a suspicious character, and has been engaged in all manner of disreputable transactions ever since he was born; whilst gold and silver, of acknowledged weight and purity—*i.e.*, coined money—are nature's noblemen, whose patent of honesty is so written on their front that they require no passport, in the shape of a legal-tender statute, to find acceptance everywhere, as the universal equivalent for all exchangeable commodities and services, and as the universal solvent for all debts; and, furthermore, that no matter how great may be their recommendation on the score of cheapness, it is very poor economy for a man or a community to work with poor tools or dishonest, tricky servants if good tools and honest servants are available.

Money existed before statute, and owes its origin to man's instincts or natural promptings. Gold and silver came into use as money also before statutes, and were made choice of for use as money for exactly the same reason that men have made choice of cotton, flax, wool, and silk as materials for clothing, and stone, brick, and timber as materials for houses; because they best of all things supply certain wants and necessities.

If the Government will confine itself simply to the business of saying how much pure gold and silver shall be entitled to use the name of "dollar"; that the standard of a dollar once judiciously fixed shall never be changed; that everybody who talks dollars shall always and under all circumstances be understood to mean but this one kind of dollar; that any promises to pay, without specifying what the payment is to be in, shall also be interpreted to mean the acknowledged standard—if the Government will do these things, and these things only, then all legal-tender laws may be wiped at once off the statute-books, and everybody will be better for it. And when that day comes, if the milkman, grocer, keeper of faro-bank, or children on a rainy day up in an old garret, want to trade, swap, barter, or exchange, and use milk-tickets, ivory chips, or pieces of old newspapers respectively, to serve as memoranda, checks, counters, or symbols, I will promise Mr. Beecher that no one will object; unless the milkman, grocer, faro-bank keeper, or garret children want to make them legal tender, and compel him, and me, and all other persons, because of the artificial character thus given them, to take them in payment of commodities and services, when we don't want to.

I am yours, most respectfully, DAVID A. WELLS.

# Notes.

THE valuable catalogue, in two volumes, of the Wisconsin State Historical Society's library, which was published in 1873, has now been enlarged by a supplementary catalogue. It embraces the additions from July 1 of th t year to August 1 of the present. The number of registered titles is about 65,000, an increase of upwards of 8,000 in the above-mentioned interval. Among the notable accessions are works relating to the American Revolution, the Rebellion, and the American Indians—the last being derived from Mr. T. W. Field's sale.——G. P. Putnam's Sons have in press 'Spiritualism and other allied Causes of Nervous Derangement, in their Medical and Medico-legal Relations,' by Dr. Wm. A. Hammond.——Bulletin No. 35 of the Boston Public Library, besides the usual list of accessions for the month (October), contains carefully-prepared bibliographical helps to students of the following subjects; Waterloo and the Campaign of 1815; Newspapers; John Wesley; and Architecture. It appears that the Library of Congress has 4,800 volumes of newspapers; the Boston Athenæum, 4,500; the American Antiquarian Society (Worcester), 4,000; the New York Historical Society, about 3,800; the Boston Public Library, 3,500; the Wisconsin Historical Society, about 2,500.——Mr. Justin Winsor is to be the editor of a new quarterly whose interest and importance will be apparent when its title is named—the *Fac-similist*. It will be published by J. R. Osgood & Co., and each number will contain from twelve to sixteen heliotype reproductions of rare engravings, MSS., title-pages, etc., accompanied by twenty pages of letterpress. The size is folio.——Hardy Mahony, Philadelphia, announce with the new year the *American Catholic Quarterly Review*, which will fill the gap just occasioned by the demise of *Brownson's Quarterly*. Dr. Brownson will himself be one of the contributors. The editorial direction will be in the hands of Drs. James A. Corcoran and James O'Connor and Mr. George Dering Wolff. It is expected to "become a valuable auxiliary to the Church in her warfare against modern error."——Mr. Benjamin R. Tucker, Princeton, Mass., has translated, and will publish in December, Proudhon's 'What is Property? or, An Enquiry into the Principle of Right and of Government,' in one octavo volume. If this venture meets with encouragement, the French author's other works will be brought out by the same admirer.——Mr. C. F. Adams, jr., on another page, corrects an unintentional injustice on our part to a meritorious cataloguer, a woman. We have also been informed that it was Miss and not Mr. E. J. Trimble who compiled the 'Chart of General Literature' noticed on page 260 of our No. 538.

—We asked the other day, in good faith, when noticing Miss Alcott's 'Eight Cousins,' what had become of the original Rollo Books. Our readers will be glad to share the enlightenment which we have since received from Messrs. Sheldon & Co., who send us the whole series of fourteen volumes contained in a generous paper box, and bound, not indeed in the simple fashion to which our memory goes back, but still tastefully and attractively. We confess to a certain satisfaction in finding the letterpress bearing unmistakable signs of antiquity. These battered stereotype plates, like the veteran's honorable scars, tell of long service in behalf of good manners and good morals. For a generation to come, as for more than a generation past, we hope our youngsters will be able to make the wholesome acquaintance of Jonas, and Rollo, and Nathan, and Mr. Holiday, and the rest. Modes of life and of travelling have changed considerably since these books were first written, so that they may be said, in a small way, to have even an historical value.

—The last numbers of *Scribner's* and of the *Law Review* both contain articles on copyright by Mr. E. S. Drone. Of the two the *Scribner* article is the more professional, and, notwithstanding that, the more interesting, inasmuch as in the *Law Review* the author allows himself, in his enthusiasm for the rights of authors, to be carried away into regions of speculation as to the twin relics of barbarism, literary piracy and slavery, in which we are unable to follow him. The common law may be to blame for a great many inconsistencies, but we doubt if it can be made any less chaotic at this day by introducing analogies between the rights with which the negro becomes invested on setting foot on board a British vessel, and the rights of which the British author is divested by the agency of the American publisher. We may hope a great deal from the abolition of slavery, but we fear the issues of the war are fading too fast from the public mind to permit this argument to be used with great force in courts of law, or even in the halls of debate at Washington. Mr. Drone in *Scribner* devotes himself to the consideration of the rights of foreign dramatists under American laws. It must have occurred to a good many starving poets and novelists that the wages earned by dramatists at the present day are rather startling; but it may not be known to them that this depressing fact arises in a great measure from the advantages which the dramatic author has in the form of his composition. The foreign author, every one knows, as long as he keeps his thoughts to himself, or confides them only to his manuscript, will, even though he lend the manuscript to a

friend or two, have at common law the same rights over it that he has over his hat or his horse. The moment, however, he publishes his work the right is gone, and in the absence of some treaty or law there is nothing to prevent the foreign pirate from at once descending upon him. Far otherwise is it with the dramatist. In his case the courts have held that to represent a play and invite all the world to come and see it is not "publication," and therefore it is possible for a dramatist to retain all his rights if he keep his play in manuscript. This is the explanation of the frequent purchases of French plays for the American stage and lawsuits that arise out of them. No court has yet explained satisfactorily why producing a play on a stage is not exactly the equivalent of publishing a book; but, as if to counterbalance the grotesqueness of this distinction by another on the other side still more ludicrous, the doctrine has been asserted that a play being produced for the benefit of the audience, the audience may put it to any use they please, and among other things any of them may carry it away *in their memories* and afterwards sell it to anybody. They may not write it down on the spot nor get it by short-hand notes; but anything that comes *memoriter* is fair game. This doctrine, Mr. Drone thinks, will soon be exploded by the courts, and it certainly seems as if it should be.

—Mr. Horace E. Scudder contributes to the *Atlantic* for November a curious piece of criticism on Andersen's short stories for children, tracing the connection between these and the old fairy-story. As he says, the old fairy-story has ceased to be a living literary growth, and is now relegated to science, which explains very clearly its origin, rise, and progress, classifies it, reconstructs it, but can never revivify it. We may add to our collections of myths from various parts of the world, and may preserve for the nursery the giants, dwarfs, fairies, elves, goblins, and brownies, from generation to generation, but we do not believe in them, and no one in literature undertakes to make new sham fairies and sham fairy-tales, or, if he does, does not succeed. Andersen, however, really invented a new kind of fairy-tale of his own, altogether different from any of the natural folk-lore which survives in the nursery. In his world the first peculiarity that we observe is the animation of all inanimate things. Not only do animals live, and move, and speak, and possess souls, but so also do tin-soldiers, balls, tops, coins, shoes, and even darning-needles, and these souls are, so to speak, always in character. The inanimate world and animals are not given voices as in the old-fashioned fable for the purpose of inculcating a moral, but in speaking and acting they do so exactly as we might naturally suppose tin-soldiers, balls, tops, coins, etc., to speak and act of themselves. We may add to what Mr. Scudder says, that in thus animating the inanimate world Andersen has done what some children are very fond of doing themselves, and all children do more or less unconsciously when their passions are aroused, and they wreak their vengeance for supposed injuries on tables and chairs. The human race, too, in its childhood, as all students of "primitive culture" know, animates the "trees and stocks and stones" with souls, while children in their imaginative beliefs are known to preserve in each generation the animistic capacity of their remote ancestors. So we may perhaps see the explanation of Andersen's success partly in his having satisfied in a literary form this childish yearning for the reawakening of the dead world, so that if we do not actually

> "Have sight of Proteus rising from the sea,
> Or hear old Triton blow his wreathed horn,"

our children have at least an escape from dull prose in these pretty fables, disclosing the wonders of everyday life which dull adult eyes can no longer see.

—One of the most amusing and impudent instances of pot calling the kettle black is afforded by Dr. Edward Sears in the September number of his *National Quarterly Review*, a publication whose prolonged existence is explainable in two ways—first, by the ease with which the form imposes on people even when the substance is wholly lacking; and second, by the well-known difficulty which a periodical or newspaper when once established has in dying. Whether there is not also a third explanation the reader may judge presently. Dr. Sears takes up for "review" a worthless and therefore very properly gratuitous 'School and College Directory,' and in slipshod English proceeds to expose its still more wretched style, and the absurdity of its paid puffs of various institutions. The poor compiler's offence is constantly brought home to him, that he has puffed only the chools that have advertised with him. The way in which his omissions are pointed out is the very acme of effrontery. Dr. Sears denounces him for not naming—the very schools, and those only, which are advertised in the same number of the *Review!* Thus: "Not a word does our School and College Guide tell us about —— —— College, which is 'located' in the same place, and which, as most of our readers are aware [see p. xi. of the *National Quarterly Review* Advertiser], ranks among the most efficient and faithful colleges in the United States." And again: "Does this 'risk' [the spiritual risk of the Roman Catholic schools] present itself at —— Female Academy [see advertisement on p. xxviii.], whose rector is an Episcopal clergyman as well as a scholar and educator? Does it exist at —— —— Seminary, Poughkeepsie [p. xxx.]? If not, still less can it be said to exist at —— Female College [p. xxii.], or at —— Institute, Pittsfield, Mass. [p. xxvii.], since the head of each of the two latter institutions is a Presbyterian clergyman, but not at all sectarian as an educator." We believe we need not multiply our extracts. In the course of his diatribe Dr. Sears makes an attack on President Eliot, of Harvard, which would be thought uncalled for except that we are led to infer an unsuccessful attempt to obtain, not to say extort, advertising. Dr. Sears probably had his reasons for not assailing President Eliot in Latin. Of his powers in this direction he gives us two samples as foot-notes—the one highly abusive, the other, addressed to the Latin professor at the college advertised on p. xi., highly effusive. The Latin of both these epistles "would have made Quintilian stare and gasp." Dr. Sears's implacable hostility to puffery appears further on in his insurance appendix, where precisely those companies are lauded which advertise with him, and *vice-versa*.

—The *Portfolio* for October (J. W. Bouton) contains a capital notice by René Ménard of Corot, illustrated by a photogravure; it is not the least successful of a series contributed by this critic, all of them showing tact and catholicity. The quotation from Corot's own writing of a passage describing daybreak—"on voit tout: rien n'y est plus"—is invaluable as describing this particular painter's mode of regarding nature, always oblique, veiled, and myopic. The article on Wiertz, now concluded, is of unusual interest, and seems candid and fair. The etchings are of a portrait by Il Moretto, and an architectural subject, and the technical notes are continued.

—Mr. Ritchie, the engraver, has finished a plate in mixed style, called "He Leadeth Me," and containing two hagiological figures in a landscape. The latter has some merit, but the human element is treated in a way that only illustrates too justly the intellectual abasement to which the artist who caters for what is called the "great religious public" is expected to stoop. The design is the engraver's own, however, and, being not absolutely false to art, the fact constitutes the claim of the print to our attention. Messrs. Gebbie & Baker of Philadelphia publish an etching of a well-known German picture, the "Roman Chariot-Race." There is not an inartistic line in this etching, though the effect halts a little in expressing the color and atmosphere of the original. Mr. P. Moran, who executed the galloping Numidian horses, is the artist who contributed the best cattle-piece to our last Academy exhibition, while the figures were done by Mr. Ferris, known by a beautiful study in aquafortis of the head of Fortuny. The publishers of the *Atlantic Monthly* send us a life-size lithographic portrait of Longfellow, by Baker, which we think may be praised without reserve as an excellent likeness, beautifully executed. It is for sale only to subscribers to the magazine.

—We discuss, in a book review on the following page, the character and merits of the controversy between the "Manchesterians" and the "Kathedersocialisten" of Germany. It will assist the reader if we define here certain terms more sharply than has been attempted heretofore. The words "free-trader" and "Freihändler" have been treated almost universally as equivalents. This use of language, we are persuaded, rests upon a misconception, and may lead, and indeed has led, to grave misunderstandings. We all know the meaning that the English word "free-trader" has acquired. It serves to designate one who is opposed on principle to tariffs, who regards freedom of commerce between nations as the ideal to be striven after, even although it may not be for the while practically attainable. But the German term "Freihändler," as its etymology suggests, has a far wider meaning; it designates not merely one whose "trade" is unfettered, but whose "acts" are free. This distinction is anything but hypercritical: it is the linguistic expression of a fact in German political history which is as substantial as for instance compulsory military service, but which has been strangely ignored. When a German declares himself to be a "Freihändler," he identifies himself—consciously or unconsciously—with that party in German politics which has effected numerous social reforms under the North German "Bund" and the subsequent "Reich." Among such reforms we place the emancipation of the trades from the restrictions imposed by the old guilds (*Zunftzwang*), the right of changing one's domicile at will (*Freizügigkeit*), the conferment of a sort of common citizenship (*Indigenat*) upon all the natives, first of the "Bund," and subsequently of the "Reich." We might instance other reforms, but the above will suffice to illustrate our position. In other words, the "Frei-

händler" party have obtained in the last ten years for Germany what was accomplished in France by the Revolution of '89, what has existed in England for centuries, and what has always been the policy of our country—to wit, the emancipation of the individual from all petty restrictions, the establishment of man's right to go and come at will, to set himself up in business where and as he may see fit, to hire his labor to whoever will pay the highest wages. This right, which to our American notions seems "born with a man at his birth," has cost the Germans hard fighting and protracted parliamentary debate. However much the exercise of it may have been tolerated, it was never legally acknowledged prior to 1867. To us Americans, Bismarck is known as the successful diplomatist, the founder of the new realm. But the German common man knows him to be, with all his squirarchical tone and testy arrogance, the founder of the new German social order, the leader of the emancipation party. Hence it is that Treitschke, who is not a blind devotee of Bismarck's, exclaims, "Why, 'Freihändler' we all are, every one of us. If the social laws passed by the North German Bund did not exist at this present day, we should have to proclaim them to-morrow, despite the bitter experiences that we have had since their passage." Treitschke is referring, not to the revisions of the German tariff, but to the abolition of the *Zünfte*, to the *Freizügigkeit* and *Indigenat* above-mentioned, and also to the questionable gift of universal suffrage. The entire force of his utterance lies in the assertion that *such* changes, despite the support they have given to the machinations of the so-called "Socialist" party, were nevertheless salutary and even necessary.

—Another term calling for fuller explanation is "Manchesterthum." Primarily and rightfully, the word designates the free-trade principles advocated by Bright, Cobden, and their followers. But with this meaning the young school of German publicists has at times coupled a suggestion of moral weakness and political inertia. Thus used, "Manchesterthum" is a term of reproach, conveying the idea that those who regard the acquisition of wealth as the chief determining motive in life are unconsciously traitors to their country, and that the country itself, in tolerating individual freedom to the neglect of its moral vocation at home and its might and dignity abroad, is on the high-road to ruin. That is to say, the free trade which has degenerated into mere money-making, and the peace-policy which cries for peace in any case and at any price, tend to undermine the national edifice and strip it of its defences against the encroachments of its neighbors. Thus Treitschke himself, in speaking of the neutral policy of England during the Franco-German war (see the essay entitled 'Die Feuerprobe des norddeutschen Bundes'), characterizes the Manchester doctrine as a mighty flood threatening to drown out all belief in the ethic value and aim of life. Whether such views of English politics are right or wrong is a point which we are not now called upon to decide. We have only to bear witness to their existence, and to show how they co-operate in bringing about a confusion of ideas and party distinctions. This confusion may be briefly formulated as follows: German sympathizers with "free trade" proper come in for a share of the denunciation heaped upon "Manchesterthum" as above defined; on the other hand, those who denounce the "Freihändler" fail to perceive that they are in a measure denouncing the party whose chief aim has been internal reform rather than the regulation of foreign commerce. The "Freihändler" movement and the "free-trade" movement, it is true, spring from a common origin, namely, the more or less radical belief in the liberty of the individual; but they are not identical. A man may belong to the one party and not to the other. Thus, the Hamburg or Berlin merchant may be a zealous advocate of "free trade" yet look with disfavor upon the "Freizügigkeit" that is flooding his city with adventurers from all quarters. Conversely, the Chemnitz or Westphalian manufacturer, while praising this same "Freizügigkeit" that gives him abundance of labor, may be in favor of a strong tariff.

## POLITICAL ECONOMY IN GERMANY.*

A FEW weeks ago, in No. 532, we gave our views concerning the New German Economists, as we styled them, and in No. 534 we published Professor W. F. Allen's reply, together with our rejoinder. Since then we have come in possession of an essay by the well-known German publicist, Treitschke, entitled 'Der Socialismus und seine Gönner,' which not only tends to corroborate our views, but throws a strong side-light upon the origin and present status of the controversy. In consideration, therefore, of the inherent importance of the subject, and of Treitschke's reputation and influence, we deem it advisable to take up this new German school once more, incorporating Treitschke's observations with our own. The essay, which appeared originally in the 'Preussische Jahrbücher,' has been republished with others by the same author, under the collective title which we give below.

At the time when Adam Smith's doctrines were ushered into the world there was no Germany, strictly speaking. There was only a congeries of states, large and small, each constituting a despotism by itself. The subjects of each were trained to implicit obedience. The advantage which Prussia had over its neighbors was that its despotism was an enlightened one. With the great Frederic at their head—it will be remembered that he was fond of styling himself the first *Beamte* in the kingdom—the Prussian officials were a class of active, intelligent, and thoroughly conscientious men. However rough and domineering its method, there can be no doubt that Frederic's régime had for its supreme object the public weal. To this régime and its immediate successors, then, the new ideas and inductions of Adam Smith came as a revelation. To use the language of Treitschke, Smith's work was the first ray of light to fall upon the brainless compilations dubbed cameralia. Smith became the teacher of Stein and Hardenberg; his translator, Kraus of Königsberg, educated Schön and the entire body of East-Prussian officials. But these German disciples of Smith were themselves independent in their way of thinking and acting. They accepted his teachings, not as absolute scientific verities, but rather as practical rules to be applied as circumstances might admit. So far from following the doctrine of *laisser-faire*, they acted upon the very opposite principle; the Crown, through its officials, forced upon the people judicious reforms which the people did not always accept without murmuring. The movement, not doctrinal but altogether practical in its nature, communicated itself to the other German states, which acted after the fashion of Prussia, and at last, after innumerable delays and rebuffs, culminated in the establishment of the Zollverein (1828–1841). While the German folk was either resting in apathy or indulging in idle dreams of democratic national unity, the foundations of the first and only true unity that the country ever possessed until 1866—its customs' union—were being laid stone by stone by the bureaucrats of absolute government. This mode of procedure is characteristic of Germany. Ever since the monarchical system prevailed, the Germans have been accustomed to look up to the throne not only as the seat of power, but as the source of progress. It is foreign to German ideas to seek for energy of initiative in the people. All the great changes in education, in trade and finance, in the relations between church and state, in the establishment of national unity, have been wrought from above downwards. Even at this day, it can scarcely be said of any legislative body, whether Reichstag or Landtag, that it originates a measure; it merely discusses and votes. We should err, therefore, were we to account for the present temper of the "Kathedersocialisten" by attributing it exclusively to the exaltation produced by the military and political successes of 1866 and 1870. The Austrian and French campaigns, it is true, have strengthened and quickened the feeling, by contrasting skilful autocratic leadership with the fiasco of 1849, but they have not created it. It is, if not innate, at least inbred through centuries of habit.

While German officials, as we have shown, were engaged in the work of slowly and cautiously adapting to German circumstances the new doctrines advocated or suggested by Adam Smith, a new era dawned upon the theories of state and nationality in general. We refer to the advent of the Hegelian philosophy. That philosophy, it is well known, sought to explain all life, the life of the individual and the life of a people, upon the theory of development, or, to use the German term, of "Werden." Everything was a phase in the development of something else, and could not be understood without being regarded as an outgrowth of the past and a germ of the future. By no mere coincidence, but in accordance with those unseen influences which govern the outward manifestations of national intellectual activity, we find—contemporaneous with the Hegelians in speculative thinking—the renowned "historic school" of jurisprudence springing into birth and gaining the ascendancy in a more practical field. Savigny, Eichhorn, and their followers demonstrated that the laws and legal institutions of a country are the growth of ages, the tangible embodiment of forces hidden from sight, which no one generation and no one man can permanently repress or essentially change. They proved, in short, that beneath the surface-life of each nation was an independent continuous organism which must be studied from the beginning. This doctrine of continuity, which is little else than Hegelianism applied to everyday life, led to a more profound conception of the state and its mission. The state, accordingly, was not the transitory form given to administration by individual caprice or spasmodic popular fancy, but the concrete and stable expression of the national life. The form, indeed, might change slowly, but the principle must abide, that the

* 'Zehn Jahre deutscher Kämpfe. Von Heinrich Treitschke.' Berlin: Georg Reimer. 1875.

state and the laws are the folk as it had become in process of development.

In passing from the domain of jurisprudence to that of political economy, we cannot do better than give Treitschke's own words. They explain succinctly what is known as the "historic school" of economists. Treitschke says, p. 539 :

"Following the lead of Savigny and Eichhorn, Roscher endeavored to arrive at an understanding of politico-economic life in its historic 'Werden'; then came the able treatise by Bernhardi on Real Property, the writings of Knies, etc., etc. Some of the older economists even began to look more closely into the ethic significance of their science, for instance Schüz, in his essay on the Ethic Laws governing Political Economy. This was carrying German thought to its legitimate conclusion. The historic school attained to the conception of political economy as a link in the chain of state-sciences, consequently as an ethic science ; they comprehend it in its connection with the totality of national life ; and they acknowledge the right of the state to interfere and to arbitrate amid the conflict of interests of society. In all this there is not a trace of 'socialistic' influences. On the contrary, Knies declared twenty years ago that the equality set up by the socialists conflicted directly with every historic conception of the state, and Roscher, ten years before that, in Schmidt's *Historische Zeitschrift*, pronounced his condemnation of socialism. The whole movement was in its nature a learned one ; it sought rather to understand how the politico-economic forms of successive ages were justified in relation to one another, than to play the part of a daring reformer in the struggles of the present."

This passage will place Roscher in his rightful position, namely, as a founder of the "Historic School" in distinction from the "Kathedersocialisten." These latter are only an offshoot of the former. They are, according to Treitschke, chiefly young professors, trained after Roscher's method and developed under the influence of the Berlin Bureau of Statistics The name "Kathedersocialisten," given to them as a nickname by their opponents, has been adopted by them in a fit of student-like humor. Their origin and influence are due to a variety of circumstances. After Prussia had succeeded in establishing the "Zollverein," Cobden's movement in favor of free trade spread to Germany. Men of business and journalists espoused the cause, which found comparatively few advocates at the universities. Like all reformers, the free-traders pushed their doctrines to the extreme. With the establishment of the "Bund" there came, as we have already shown, a radical reconstruction of political society and domestic trade. The change, which wrought so much good, brought in its train not a little evil. The French war, the establishment of the "Reich," and the French indemnity-money, served to aggravate the evil. All Germany was handed over to speculators ; the age of the "Gründer" set in, to the alarm of every sober thinker. Prior to the Vienna and Berlin panics of 1873 there seemed to be no check to the feverish pursuit of gain ; in appearance, trade, finance, and even society itself were threatened with disintegration. Stock-jobbers, railway contractors, house-builders, stepped into the foremost ranks of the world, while those who lived upon fixed incomes, all professors, teachers, officials, and officers of the lower grades, saw themselves reduced suddenly to comparative insignificance and poverty. It is not surprising, then, that a party of reaction should have arisen ; this party is personified in the "Kathedersocialisten." They have little in common with the socialists proper, and that little is due rather to circumstances and to bewilderment of ideas than to innate sympathy. They are men of science who misapply their doctrines, who in the heat of angry controversy go further than they are aware of ; the socialists are rude and, for the greater part, illiterate demagogues. The "Kathedersocialisten," suffering from the evils that mark the present state of transition, claim for the Government the right of interfering and curbing the license of individual speculation. But they do this with the tacit understanding that it is the mission of the state to foster true liberty. They wish for interference, but only for such interference as may enable each one to do his work best without the risk of being driven to the wall by the unscrupulous ; whereas the socialists proper wish to convert the state into a sort of employment-bureau that shall see that each man is fed and clothed, and that all are brought down to the same glorious equality of besotted ignorance. We are not to be understood, of course, as advocating or justifying the views advanced by the "Kathedersocialisten," for we regard their course as prompted by mistaken zeal. We are merely explaining how and why it is that they have risen to sudden prominence. We believe, furthermore, that this prominence has been greatly overrated, and will speedily disappear. It is the passing manifestation of a spirit which is to be found in every society, even in our own—witness Judge Kelley and his 3.65 panacea—but which is inbred, as we have already shown by implication, in the German character : we mean the impulse to look to the Government for active measures in times of great social distress, instead of trusting to the relief which comes with time, good sense, and hard work. Treitschke calls the quarrel between the Manchesterians and the "Kathedersocialisten" a windmill-fight, and calls upon sensible men to give it up. His argument, confirmed by the course of recent legislation, is that the moment both parties quit the field of pure theory, and discuss practical measures, it is possible to arrive at a satisfactory working compromise. We ourselves are inclined to this opinion. It seems to us that the future policy of Germany will hold the middle course between two extremes. On the one hand, the military constitution of the empire, bureaucratic spirit, and the force of habit will always render a formal acceptance and sanction of the doctrine of *laisser-faire* impossible. On the other, the empire is committed beyond revocation to a course which will end in the greatest individual freedom compatible with strong government.

In conclusion, we wish to call attention to a side-phase of the question which should not be overlooked. Prince Bismarck is not a theoretician. He has read much, probably far more than is generally supposed ; but he does not attach importance to abstract principles in affairs of state. As his speeches show, he is familiar with the history of his country, enough at least to know the weaknesses of the race. These are, in brief, deference to enthroned authority and proneness to sweeping theories and hair-splitting distinctions. The deference he accepts as his working-tool, the theories and casuistry he brushes aside as so many cobwebs. He has avowed on more than one occasion his contempt for the "professors," and this feeling is shared by his associates. German statesmen are too familiar with the empty lucubrations at St. Paul's, Frankfort, in 1848–9, to take for pure gold all that is proffered by the "Gelehrtenstand." Even Gneist and Virchow, who are unquestionably the best of their class, have betrayed on several occasions their impracticability in a manner which must have been extremely irritating to the ministry, and which stood in marked contrast with the conduct of men like Lasker. It is probable, therefore, that the influence of theoreticians and university men in Germany will diminish more and more, although it will never cease to be an active power. It may not be unprofitable to dwell for a moment upon the approximation thus suggested of American and German ways. In Germany, the influence of mere learning on the wane ; in America, we hope at least, on the increase ; and both changes a great gain. True, our hopes for America are not of the liveliest ; they are dashed every now and then by the revelations of "rings" and lobbies and inflation schemes. Still, there are symptoms in the older States which encourage us in the trust that politics are on the mend, that a wholesome respect for scientific training and personal integrity is spreading from the learned circles to the men of action. As for Germany, we can only wish that she may indeed enlarge the sphere of practical wisdom, and set narrower limits to ex-cathedra dogmatism.

---

*The Life and Writings of John Howard Payne.* By Gabriel Harrison. (Albany, N. Y. : Joel Munsell. 1875. Pp. ix.–410.)—Mr. Harrison is a member of the Faust Club of Brooklyn, before which, in 1872, he read a paper upon Payne with the view of calling forth subscriptions for a memorial to the author of "Home, Sweet Home." In this he succeeded, and on September 27, 1873, in Prospect Park, Brooklyn, a bronze bust of John Howard Payne was unveiled with appropriate ceremonies, including the reading of an occasional poem by Mr. John G. Saxe. To the customary account of such a celebration, Mr. Harrison has prefixed his original paper with additions. The material for a full biography is abundant ; Payne was nearly always before the eye of the public, and his movements were duly recorded by the press. But in addition to the sources of information already in print, Mr. Harrison is in possession of many of Payne's MSS., including his diary and his correspondence with his sister. It would be difficult to make other than interesting the life of one so well known, who was the friend and correspondent of Talma, Kemble, Kean, Sheil, Moore, O'Connell, Allston, Irving, and Elliston. Mr. Harrison has succeeded in overcoming the difficulty : his book is dull. Its four hundred pages produce the effect of a mere mass of matter undigested and ill-arranged. The style is diffuse, the English is deplorable, and the grammar will not always bear inspection. Grotesque errors like the following are not rare : "Among the gentlemen who contributed were Mr. James Hart, Mr. Gabriel Harrison, . . . Mrs. Nagle, and others" (p. 230). From this specimen we should judge that Mr. Harrison, as Chairman of the Committee of Arrangements, was responsible for the programme of the Prospect Park celebration, one paragraph of which reads : "4. *Home, Sweet Home !* sang [*sic*] by one thousand public-school children, in which the assemblage are requested to join the chorus." The misprints are numerous ; in the programme (p. 112) of the benefit given to Payne at the Park Theatre, November 29, 1832, we read that "Mr. Cooper has obligingly consented to recite in the course of the

evening Alexander's 'Faust'" (*sic*). Finally, the book has not even a table of contents; of course there is no index.

Mr. Harrison adds to the volume, if not to the value of the book, by reprinting "Our Neglected Poets," an article from the *Democratic Review* for February and March, 1838; "Lispings of the Muse," a selection of juvenile poems privately printed for presentation, in 1815; and "Brutus," the tragedy written for Kean. Although generally identified in America with Junius Brutus Booth, and latterly with his son, Mr. Edwin Booth, this is the only one of the author's forty dramatic works which keeps the stage to this day, and the only tragedy by an American which has been successful in England. Mr. Harrison, having Payne's album in his hands, has actually filled over twenty pages of this volume by reprinting from it various poems by Washington Allston, Barry Cornwall, and others. If this system of biographical writing is to obtain, the work of future biographers will be easy. They need only get possession of their hero's commonplace-book, and whenever facts are wanting for the life they can fill up with fancies from the album. Mr. Harrison, to do him justice, has not always acted upon this principle; his researches have fixed the dates of Payne's birth (New York, June 9, 1791) and of his death (Tunis, April 9, 1852). These are inaccurately given in all biographical dictionaries, including Allibone. They are not even right upon the monument erected over his grave by our Government.

In 1835, in its celebrated review of American literature, the London *Athenæum* doubted if there were seven men in England who knew Payne to be an American. From the correspondence in an English literary weekly two or three years ago, it seemed as though there were not then seven men in all England who knew that Payne was the author of "Home, Sweet Home."

---

*American State Universities: their Origin and Progress.* By Andrew Ten Brook. (Cincinnati: Robert Clarke & Co. 1875.)—The title of Mr. Ten Brook's book is misleading. The volume contains 410 pages. Of these, four are devoted to the index, and twenty-one to an appendix containing documentary matter of little moment. Of the remaining 385, no less than 309 contain a history of education in the State of Michigan simply, and more particularly of the University of that State. In fact, this is the only American State University of which he says anything worth saying. His work ought therefore to have been entitled a 'History of the University of Michigan, with Some Remarks on the Past and Future of Education in America.' His accounts of the earlier attempts to provide popular education in this country, and of "the state of early culture in the West," as he calls it, and of the early Congressional land-grants for universities, contain nothing which every tolerably well-informed reader of American history is not already familiar with. Indeed, the chapter on the "State of Early Culture in the West" is misnamed altogether. It is simply a descriptive sketch of pioneer society, which shows that there was not for a generation or two after the first settlement of the West any culture whatever in that region, either "early" or other. The history of the University of Michigan is merely the tale told, in very slipshod English, of the attempts of a New England settlement which loved learning to build up, with little or no money and plenty of wild lands, an institution devoted to the higher education. There is nothing very remarkable in the struggle. There was an abundance of the "financing" and of the conflicts between the scholars and the politicians with which all observers of American business and politics are now familiar, and many of Mr. Ten Brook's pages are devoted to the minute recital of squabbles which can hardly interest anybody outside Ann Arbor, and were well forgotten even there. The portion of the book which will possess most interest for the general reader is the chapter on the "Prospective University," in which the author states clearly enough the nature of the various problems which now vex or occupy the friends of University education in this country, and he makes some good practical suggestions about them, but we cannot say that he makes any important contribution to their solution. His discussion of "self-education" is clear, if not very novel, but he indulges in a large amount of platitude, which produces a somewhat comic effect when thrown into italics and announced as an important sociological generalization, like the following: "*That the course taken* [by individuals or nations] *will be successful in the ratio, and only in the ratio, of its conformity to the Creator's purpose, known or unknown, in the constitution of the human mind, and its habitation, the world.*"

---

*Spain.* By the Baron Ch. Davillier. Illustrated by Gustave Doré. Translated by J. Thompson, F.R.G.S. (New York: Scribner, Welford & Armstrong. 1876.)—Baron Davillier is a very unsentimental tourist, and what he has produced is really only a guide-book of the better sort, to which the printer's art has given its chief distinction. The personal element of the travellers (the author and the artist were companions) counts for very little in the narrative. Doré, indeed, is scarcely more than a lay figure, so that we are doubly surprised when (p. 312) we find him taking the fiddler's place at a dancing academy, where he "played the *jaleo* with marvellous skill. It is well known," continues the Baron, "that our great artist is a violinist of the first order; Rossini, who knew him, gave him a brevet with his own hand." By the way, we may notice that the fiddler is called by the translator a "blind *ciego*," and afterwards "the *ciego*," as if the word were untranslatable in both instances, or even were Spanish for fiddler. It is well to know the sober truth about Spain, but a matter-of-fact observer like Baron Davillier seems tenfold more so when contradicting the poets. At Barcelona he tried in vain "to discover the least trace of the 'Andalouse au teint bruni' of Alfred de Musset." At Valencia—which, according to Victor Hugo in one of his 'Orientales,' "has spires to three hundred churches"—"after the most painstaking and exhaustive search, we failed to discover a single example of the forest of spires described by the poet." It must be said in favor of our author that his journey with Doré (apparently in the year 1872) was made when Spain had become an old story to him, and that he supplements his meagre diary with knowledge and experience drawn from his previous visits to the country. Of Doré's illustrations we spoke last year when noticing the original French publication. It may be said, in a word, that they are characteristic (without being brutal, as too commonly in Taine's 'Pyrenees'), and that they forcibly reveal the artist's defect as a colorist. The paper, print, and binding make this work an elegant gift-book for the holidays.

# Fine Arts.

## TIETJENS.

THE appearance here of Teresa Tietjens in opera fifteen years ago, or even ten, would have been a musical event of great interest; her appearance here now in the concert-room has not produced a very deep sensation. And yet no lover of music whose taste has been cultivated to the appreciation of the highest school of vocalization can listen to her without great pleasure, for there is no doubt that she is the most eminent living exemplar of the grand style of singing. Indeed, she is almost the only prima donna of note now before the world who has that style in anything like perfection. Of mere musical declaimers there are enough—some with pretty good voices and some without; of brilliant vocalists, performers of musical ground and lofty tumbling, there are not a few; of singers with agreeable voices and a fluid, pleasant style the musical world is always pretty full; but of singers with voices of the prima-donna rank, and who add to that the grand style, there is never a very large supply, and of late years it has been notably diminishing. The reason of this is twofold. First, nature does not furnish the material in any great abundance. Fine voices, voices that by their quality and their power are fitted to command the attention of the world, are rare; and the union of such a voice with the musical capability, the emotional susceptibility, and the feeling for art that are required to make a great singer, is rarer still. Next, the musical tendencies of the last twenty-five years have been toward the suppression of the grand style. Verdi on one side and Offenbach on the other may be regarded as the representatives of those influences; and the greatest admirer of *Ernani* and *Il Trovatore*, or of the *Grande Duchesse*, must admit that, whatever the merits of the music of those compositions—and even the latter has merits of a certain kind—they do not tend to foster a noble style of singing, but rather to destroy it; to crush it, on the one hand, with the gross and heavy hand of mere sonority, and to fritter it away, on the other, by triviality and musical clap-trap.

Of singers in the grand style we have had in America some notable examples during the last twenty-five years—few in number but of great distinction. The first who is likely to be remembered by any of our readers was Katarina Barili, the mother of Adelina and Carlotta Patti. She did not sing here often, and she was in the decay of her powers, or rather of her voice. The latter never was first-rate, but her style was—so great, indeed, that if her voice had been equal to it she would have been one of the great historical prima donnas. The majesty of her musical elocution, the dignity of her

carriage, the delicacy of her inflections, and last, not least, the fierce flame of her passion, made her performance, notwithstanding the defects of her voice, which, however, was full of meaning, something ever memorable. And her style was grand ; large, simple, all-satisfying. She could not sing the most insignificant musical phrase without showing it. Her daughters, even Adelina the "diva," as they call her in Europe, never approached her in this respect. After her we had Lind and Alboni, the two great singers of the generation ; and they came to us in the fulness and perfect freshness of their great powers. Grisi came too ; but not in her freshness. Her voice was like some parts of her wardrobe—a somewhat limp and soiled magnificence. Moreover, with all her superb qualities of person and of voice, and her delicious vocalization, she lacked in some degree that fine artistic intelligence and that richness of moral nature which go to the making of a prima donna of the very highest class.

Since their day we have had no examples whatever of the grand style of singing until the appearance of Madame Tietjens. Tietjens shows her high quality first by the perfect simplicity of her manner, and by her calm consciousness of power. With a nature capable of all the strongest impulses of passion and a power of manifesting them with all the resources of her art, she has that serenity which goes with great strength, and which we see expressed in the heads and in the poses of the great Greek sculptures. She leaves no doubt ; she asserts herself at once. After hearing her sing one phrase we have no question as to her quality. She shows an artistic nature of the highest order in everything that she does, and with it the results of the most thorough training in the best school. She has in affluence those qualities of mind and soul in which Grisi, as we have said, was somewhat deficient. Every phrase has meaning ; every inflection purpose. She is never uncertain, and has in a marked degree that trait which is one of the strongest indications of the possession of great powers—a clear knowledge of what she can do and what she means to do. In all art there is no surer indication of inferiority than fumbling. This is particularly manifest in music. Consider for a moment the works of the great composers, Bach, Haydn, Mozart, Beethoven, how every movement marches steadily on from the first bar with direct, clear consciousness of purpose, and then compare this trait with the manner of composers even of the second class, who never assert themselves after this godlike fashion. The same trait is shown in the execution of music, and Madame Tietjens is one of the few who have this grand manner.

All this is true—true without qualification or reserve ; and yet to those who have never heard Madame Tietjens until now, it may seem somewhat extravagant laudation. And with reason ; for this great artist is not now able to give us the full flavor of her real quality. The musician can perceive what she is ; but that indefinable something which comes with youth and lasts through maturity, and which gives, and is necessary to give, perfection its zest, is gone. It is a sad thing to say of a woman, How beautiful she must have been ! And so it is to say of an artist, How great she must have been ! And yet unhappily we are obliged to say this of beautiful women and of great artists. We would by no means imply that Madame Tietjens's voice is gone. Far from that. It is still fine ; and although her highest and lowest notes do show the effect of the pitiless hand of time, in the middle and most essential part of her register it still remains firm, pure, and clear. But the bright, elastic, incisive quality which pertains to an unimpaired organ of good quality, and which may be found in numberless voices much inferior to hers, is lacking. We listen to her with admiration for the sake of her singing ; we should not listen to her for the mere delight in the quality of her voice. Moreover, her intonation has ceased to be absolutely faultless. No one, indeed, would say that shesi ngs out of tune ; but that absolute and exquisite certainty of interval which we expect of a prima donna of the highest class is occasionally conspicuous by its absence. Moreover, to add one item to this brief, reluctant record of defects, Madame Tietjens never had a first-rate voice. First-rate voices are such sopranos as Lind's and Grisi's, such contraltos as Alboni's. With these, in richness and still less in volume, Madame Tietjens's voice could never compare. In its meaning, in the significance of its inflections, it was equal to theirs, and to Grisi's superior ; but in mere musical quality, and in power, it never was at their level. In justice, it should be added, however, that theirs are the only first-rate voices—first-rate in power, in compass, in quality, and in flexibility—that have been heard among prima donnas for a generation. There is another difficulty with which Madame Tietjens has to struggle, and which, as it is of a physical, and almost of a mechanical nature, is to be alluded to rather than bluntly told. Madame Tietjens's phrasing is as perfect as can be—in design, and generally in execution ; but her ideal sometimes fails of realization from this cause. The ability to phrase well depends, for its mechanism at least, upon breathing. A breath so short that it breaks a phrase which should be continuous, or which fails to carry it firmly and clearly to its proper close, makes false musical punctuation, and, to a certain degree, feeble delivery. Now, perfect breathing depends on a free movement of the diaphragm and expansion of the lower part of the chest, and when this latter becomes from any cause so large that violent means are necessary to bring its outlines anywhere within the proportions which are deemed desirable at all costs and hazards by most women, the result is unfavorable to perfect phrasing, and the vocalist is reduced to the condition in which Hamlet's mother said he was when he was fencing with Laertes. Owing to this condition of things, Madame Tietjens sometimes comes up rather short at the close of a flowing passage of semiquavers.

Our chief regret, however, is that our enjoyment of Madame Tietjens's noble singing has been, and is likely to be, confined to the concert-room. The full exhibition of her great powers requires the stage. For there she not only displays her matchless musical elocution, but exhibits powers as an actress which would have made her great if she had not been able to sing a note. Her face is mobile, expressive, and, without being unfeminine, grandly strong. Like her style of singing and her bearing, it commands attention. You cannot turn away from it with indifference. It is one of those faces to which it is hard to say no. In the concert-room she seems as if she were singing in fetters and in a cage. For she is a natural actress in a grand way—everything about her is grand—and she has acquired by profound study and patient practice the rare art of making her musical utterance and her dramatic action work together and each enforce and illustrate the other. However, let us be thankful for the opportunity of hearing her even as we do, for there is no prima donna now before the world of her quality. No artist worthy of her companionship has appeared with her in her concerts, except Miss Drasdil, who, although not a great singer, is forming herself upon the grand style, and deserves a more marked recognition of her fine qualities than she has yet received.

*Debates of Congress Abridged.*

*Forty-third Congress, Second Session* (1874–5).

To which are added the President's Messages and Proclamations, Treaties, a list of Acts passed, and important Reports of Committees. Abridged and compiled by C. H. Jones. 8vo (uniform with Benton's Debates). $5. Sold only by subscription. Sent, carriage free, by the publishers on receipt of the price.

With the favor of the public, a similar volume will be issued for each session of Congress hereafter. Subscriptions are invited for ten volumes, to cover the interval between Benton (who closed in 1850) and the present work.

HENRY HOLT & CO., Publishers, 25 Bond St., N. Y.

*BANGS, MERWIN & CO.,*
658 BROADWAY,

Will Sell at Auction on WEDNESDAY and THURSDAY, Nov. 3 and 4, at 4 P.M.,
*A LIBRARY* of Scarce and Interesting Historical and other Works, Early Printed Books, etc.
FRIDAY, Nov 5, at 4 P.M.
*A LAW LIBRARY*, comprising many valuable Reports, Digests, etc

TUESDAY, Nov. 9, at 3 P.M., and following days—same hour.
*ENGLISH AND AMERICAN BOOKS*, including many expensively Illustrated Works, Attractive and Popular Juveniles, Bibles, Prayer-Books, etc. The whole collection well adapted to the season.

NEW BOOKS.

*OPIUM EATING.* An Autobiographical Sketch. 12mo, cloth, extra, $1.
"This book lacks the peculiar rhetorical charm of De Quincey's 'Confessions,' but, as a warning against the opium habit, it is even more impressive than that work.

*THE GOLDEN TRESS.* Translated from the French of Boisgobey. 12mo, cloth, extra, $1 50.
A French novel of the better class, full of thrilling incident.

*TWO THOUSAND YEARS AFTER;*
or, A Talk in a Cemetery. By John Darby, author of 'Thinkers and Thinking,' 'Odd Hours of a Physician,' etc. 12mo, cloth, extra, $1.
The author strives to enforce the idea that man is the only offspring of creation to whom has been given the capability of receiving and holding the immortal principle, and that the extent and character of his immortality depend upon himself.

*JONAH, THE SELF-WILLED*
Prophet. A Practical Treatise on the Book of Jonah, with Exegetical Notes by Stuart Mitchell. 12mo, cloth, extra, $1 50.
*** Will send per mail prepaid upon receipt of price.
CLAXTON, REMSEN & HAFFELFINGER,
Nos. 624, 626, 628 Market Street, Philadelphia.

*work on Correggio, written by Mrs. Charles Heaton, and just published by Macmillan & Co., is examined by "The Reader" on page* ii.

# The Nation.

*NEW YORK, THURSDAY, NOVEMBER 11, 1875.*

## The Week.

THE completed election returns show that there was a great deal of what Mr. R. G. White calls "heterophemizing" done last week by certain newspapers in announcing the results. The Republican newspapers in this State generally stated as late as Wednesday afternoon that New York had gone Republican; but while they wrote "Republican" they clearly must have thought "Democratic," for it seems now that the Bigelow ticket has upwards of fifteen thousand majority. This is not an overwhelming majority, nor was it what the Democrats expected; but, considering that the party had united against it the Canal Ring, the remnants of the old Tweed Ring, the Short-Hairs, the "Gravel-Train" vote, and the Anti-One-Man-Power vote, and had raised in "administrative reform" a rather too scholarly slogan for the masses to take up, this was doing pretty well. The Legislature is Republican in both branches. In Massachusetts the vote has fallen since last year from 185,720 to 172,809, and Rice is elected by 5,277 plurality; the Prohibitionists, however, threw away some 9,000 votes, which are practically to be counted on in important years as Republican. There were some 2,000 scattering votes, most of them being cast for Adams. In the same way, in Pennsylvania, Hartranft has a majority of 11,945, while the Prohibition vote is estimated at from 10,000 to 15,000. The returns from Wisconsin show that the State is so closely divided that the election cannot be considered a triumph for either party.

The "arithmetic man" has gone to work upon these returns with the usual astonishing results. During most of the year the arithmetic man is quite silent, doing little or no work so far as the public knows, though no doubt thinking a great deal; but on the morning after election he is roused from his inactivity, and begins to perform those wonderful feats of calculation which have established for him his world-wide reputation. He has apparently little or no connection with the editorial department of the Press, for his calculations in one year invariably refute the editorial predictions founded on his calculations the year before. We have before us no less than four calculations by this expert, any one of which should enable us to forecast with certainty the results of the Presidential election of next year. On the cardinal fact that there are 369 votes in the Electoral College, he is at one with himself; but we are sorry to say that in some of the details he makes a good deal of allowance for diversity of tastes. In one paper, the Washington *Chronicle*, he declares the result of "a careful survey of the field" to be 228 Republican votes, 101 Democratic, and 40 doubtful, which considerably impairs the value of the prediction considered as an absolute prophecy. On the other hand, in the N. Y. *Herald* he allows himself less "margin," and gives 188 votes to the Democrats and 181 to the Republicans; while in the Milwaukee *Sentinel* he gives the Republican votes as 180 and the Democratic as 177. Inconsistently enough, in the Albany *Express* he makes 179 Democratic and 190 Republican. These figures, as they say, speak for themselves. The variations may be attributed by cavillers to a vacillating disposition and a desire to "trim," but those who have followed the checkered course of the arithmetic man attentively during the past few years will take a more kindly and genial view of the matter.

The "Reformers" at the late city election are beginning to rub their eyes and ask themselves seriously wherein does the reform consist. The *Evening Post* in particular gives signs of serious mental perturbation. In fact, the whole party remind one of the mob who burnt the obnoxious banker's bills in order to punish him. The plain facts of the case are that the Reformers solemnly called on Tammany two years ago to reform the organization and expel the bad men. So Kelly, assisted by a few respectable men like Mr. A. S. Hewitt, did drive out Morrissey and his following, probably the worst lot of rascals by which any Christian city was ever infested. There is no other civilized city in which such rogues and vagabonds have an equal share in the municipal government. These malcontents formed the Short-Hair party, headed by Morrissey, and began to wage war on Tammany as Swallow-Tails or aristocrats, their main object being to quarter themselves on the public treasury by obtaining fancy wages for nominal work. The Mayor and the Public Works Department then made the first practical and fundamental reform that either the Democratic or any other party has made in city politics, by laying down the rule that the city was a business corporation, and would only pay the market rate of wages. In doing this, they arrayed themselves against the most dangerous and alarming feature in municipal demagogy, the one which is most capable of proving a means of covert confiscation, and which is most likely to grow and become uncontrollable. The duty of the Reformer was plainly to support this stand by every means in his power, and to unite all the tax-paying classes in support of it, and put up such a ticket and such a platform as would have satisfied the Swallow-Tails and Tammany that this and things like this were what they must do if they meant to remain in power, and would have convinced the Short-Hairs and their leader that the only road to comfort or power in this city lay through honest industry, and that it was a poor place for tramps, vagabonds, blacklegs, and gamblers.

What followed, now that one looks back on it, was little short of ludicrous. The Reformers, including the Brown-Stone Voter, made the remarkable discovery that Tammany was still impure; that there were "bad men" on the General Committee; that Kelly could not compare with Peter Cooper as a citizen or Christian; and then went to work and alleged that Kelly had tried to bully Recorder Hackett into allowing his court officers to be appointed by politicians, which was of course reprehensible, but which, even if true, in no way changed Hackett's character. But the Reformers at once took up Hackett, who is an old friend and comrade of Judge Barnard, and extolled him to the skies as a model judge. They joined forces with Morrissey and the Short-Hairs, and helped them in every way they could, by suppression, evasion, and distortion. Nothing can be more delicate, and require a more careful consideration of consequences, than any transfer of power in this city. The Reformers achieved it, not only without consideration but in a kind of frenzy. For two weeks they cursed, blackguarded, called names, bawled, made "charges" and counter-charges, like so many acute maniacs, and ended by raising Morrissey to the rank of the most influential, popular leader; by convincing the dangerous classes that he is the man to follow, and that they are an all-powerful body in the city; by convincing the Mayor and the Commissioner of Public Works, and Kelly and Tammany, that they cannot count on support in any reform as long as the Tammany Society is not composed of professing Christians; and by restoring the old rule, that the lazy vagabonds who do city work are to receive fancy wages. Under all the circumstances, Did any one ever see the like? is the only appropriate question. They are now solemnly trying to prove that Kelly was not in favor of market wages, which is a comic reason for helping to set up another Boss who is in favor of fancy wages, and makes this his sole stock-in-trade, and who is besides an habitual criminal.

The Republicans in Washington have celebrated their victory in a curious fashion by serenading the President and Boss Shepherd. They both made a speech, the President assuring the crowd that

the "rag baby" had been "effectually killed," and that the party would carry the election next year. Three cheers were given for "the President's school policy," and the crowd then went on to the house of the Boss, who made a much longer address than that of General Grant, congratulating his audience on the fact that the "tidal wave" had left its opponents "stranded on the beach"; declaring that the people had again shown their unwillingness to deliver the Government into the hands of a party which "has well-nigh demonstrated the incapacity of man for self-government"; referred with pleasure and gratification to the downfall of Tammany in this city, and with pride to the "great and good President" who presides over the party "which has redeemed the national metropolis from the squalor and filth in which it had lain mouldering for nearly half a century, a by-word and reproach among the cities of the earth, and transformed it into a thing of beauty, making it worthy of the hallowed name it bears." He added to this that he was, "in the future as in the past, for good republican government, the advancement of the material interests of this great nation, the preservation of our national life, the payment of our debt in money, and for all that tends to the progress and advancement of my fellowmen." Bristow, Jewell, and Pierrepont were not serenaded.

The discussion now going on in the Democratic ranks on the subject of the next Speaker of the House is a curious illustration of the benighted condition many people seem to be in about "hard" and "soft" money. On one side it is urged that the recent elections having conclusively proved that inflation has no strength, the inflationists ought to give way, and allow their opponents to put their own man in the Speaker's chair, and thus secure the Currency Committee; on the other, it is maintained that there should be no factious disputes over a matter like the Speakership; that the Speaker ought to be an able, impartial man, who, recognizing the fact that there is a diversity of opinion in the party on the subject of money, will make up a fair, impartial, non-partisan committee, with say six hard-money men, six inflationists, and one member who has not wholly made up his mind. This is the way the Republicans have generally settled the question, and why is it not the fairest and most statesmanlike way? The reason why it is not is simply that it ought to be impossible for any intelligent Speaker of a parliamentary body to recognize any such body as an inflation party in appointing his committees. "Specie payment" is not a question on which intelligent men who have looked into the matter differ, and it is a perfectly well-established fact that the only persons among whom paper delusions still linger are charlatans, demagogues, or men who have given no thought to the subject, and are therefore incompetent to have an opinion on it. Putting "soft" money men on a currency committee is in reality very much the same thing as it would be to put on men who believed in the philosopher's stone, or to make up a Board of Health partly of men who believed in scientific medicine and partly of those who thought diseases ought to be cured by charms, exorcisms, and the elixir of life.

Professor Marsh will, we understand, bring a mass of evidence before Congress this winter, for the purpose of discrediting the report lately made by the Red-Cloud Commission, and in order that a full and impartial investigation may be made into Indian affairs. There is probably nothing which Congress could better apply itself to than this; and we suggest that the first thing that is undertaken should be an enquiry into the behavior of the Commission itself. The *Tribune* at the time of the appearance of the report made a statement that seemed at the first blush incredible enough, to the effect that the chairman of the Commission, Thomas C. Fletcher, had occupied a good deal of his time while the investigation was going on in writing letters, under an assumed name, to a Western newspaper, defending Delano from the charges against him; or, in other words, whitewashing the Interior Department and the Indian administration, and generally taking the part of counsel for the defence. We had supposed that this was a pitch of indecency and rascality which not even the present condition of Washington affairs could produce; but we find on investigation that the charge is perfectly true, and cannot be denied. We hope the "party of hate" will look into this little matter when Congress meets.

The letter of Mr. A. G. Browne, jr., on the curious proceedings of the Court of Appeals in the Canal Ring and Tweed cases will not do much to inspire the public with respect and regard for the Court of last resort in this State. The things which are susceptible of proof with regard to the Court are—1st, that at least one of its judges was "counted in," and is really no more a judge than the first man you may meet in the street; 2d, that with regard to another there was a vast amount of counting done, though whether it actually determined his election or not may be doubtful; 3d, that the chief judge is a noted politician, who has no hesitation at being "interviewed" and loudly abusing counsel practising before him; 4th, that some of the judges were from a part of the State in which the Canal Ring is all-powerful and may be supposed to influence judicial as well as social opinion; 5th, that the Court was elected in 1870, at the height of Tweed's power, and when Tweed and the Canal politicians were notoriously intimately allied; 6th, that for some singular reason all the cases they have had an opportunity of deciding as to Tweed have been in his favor, and all the cases they have had an opportunity to decide as to Canal contractors have been in their favor. They have gone, too, so far as practically to override entirely the provision of the constitution that was intended to prevent the letting of any canal contract except to the lowest bidder, and have declared acts of the legislature which destroyed this safeguard constitutional. There may be no connection between these facts, and we do not wish to impute corruption to the judges in any way, but the warmest believer in their purity may be challenged to deny that in the discussion as to the Court into which the newspapers have been absolutely forced during the past few months, by charges openly made by counsel practising before it, a spectacle of judicial degradation has been given to the public which it would be difficult to match in the annals of any civilized community.

The week has witnessed a decided change in both the gold and foreign-exchange markets. The price of gold fell about 1½ per cent., and concurrently the rates for sterling exchange advanced, until bankers' demand bills commanded a price within half a per cent of that at which gold coin can be exported to Europe without loss. The decline in gold was caused primarily by the fact that Saturday's bank statement showed that the New York banks possessed an amount of specie which it was not expected they would hold until the January interest began to come out of the Treasury by prepayment in December. Where the gold came from is not susceptible of explanation, except on the theory that a large amount previously withdrawn from the markets had been restored. The Treasury disbursements were large, but did not exceed calculations made by bankers. Secondarily, the decline was due to a belief that the result of the elections last week makes the success of hard money, as a political issue, more probable—a belief strengthened by the speech of President Grant, which has been construed to mean that he intends in his message to Congress next month to throw his influence even more decidedly in favor of specie payments than he did last winter. The decline in gold has further been aided by the drift of speculation being "bearish," as is shown by the fact, that notwithstanding the increased supply of gold here, the borrowing demand is so large that holders of coin get it carried free of interest. The influences which have worked against a decline in gold, but which have not, however, effected an advance, have been (1) the fact that the San Francisco money market has been so active as not only to stop the flow of gold thence to New York, but to compel shipments from here, and (2) that the London market has been so disturbed, by the fear of political complications growing out of the Eastern question, by the large failures at home, and by the report that a new Russian loan is soon to be brought out there, that securities have fallen to figures which justified exports to New York.

General trade during the week has, considering that the elections drew attention from business, been fairly good. The movement of the crops has been extraordinary in respect to cotton, and otherwise not worthy of special mention. Railroad receipts are increasing, but the money market does not show the activity which should accompany a fair trade. At the Stock Exchange, speculation has been of moderate volume, and prices have been higher rather than lower than last week. The case between the Union Pacific Railroad and the Government, recently argued before the United States Supreme Court, but not yet decided, has attracted such attention at the Stock Exchange that it may be safely said to be the pivot on which the market will turn. Should it go in favor of the Company, prices will probably advance; and if in favor of the Government, they will probably decline. Large amounts are staked on each side, and "special information from Washington" is speculated on in a way that is scandalous.

Military preparations on a considerable scale are said to have been made for the burial of Guibord, and Bishop Bourget has compromised matters by declaring that he will curse the grave *in perpetuo*, but warns his flock not in any way to interfere with the funeral. This arrangement will have some curious results. The grave is, we presume, the freehold of Guibord's heirs, so the curse will operate as a kind of lien on it, and, as the lawyers say, "run with the land" like a covenant, which might prove very inconvenient if it should ever come to be used for any other purpose than a cemetery. Moreover, if we are rightly informed, Madame Guibord's remains lie directly below the place in which Guibord's are to be interred, so that if the curse descends as low as the fee—*i.e.*, *usque ad inferos*, or to the centre of the earth—it will embrace her resting-place also, and it is questionable whether a bishop can curse the grave of a person who died in good and regular ecclesiastical standing. In order to protect Guibord against forcible disinterment by religious persons, he is to be enclosed in a huge stone sarcophagus of immense weight, which again is to be cased in cement that will resist the hardest chisel. The affair has raised one curious point in London. Poor Guibord incurred ecclesiastical censure because he belonged to a literary institute which had condemned books in its library. Now, Cardinal Manning belongs to the Athenæum Club, and frequents it a good deal, although its library is full of bad books. Profane persons are therefore asking themselves how this can be; but we presume the Cardinal would answer that his business is to see what the wicked are about, and that, as a high dignitary of the Church, he can stand bad books.

Unless all signs should fail, the present session of the German Reichstag will abound in angry debate. The Bund Committee on judicial matters—a body which exercises functions not unlike those of our Judiciary Committee, although its composition is very different—has prepared and published the draft of a revised penal code which it intends to submit to the Reichstag. There are two or three features in this bill, as we may call it, which are of importance. Emigration has long been a thorn in the side of the Imperial Government, the outrageous treatment of German emigrants in Brazil having excited a feeling of righteous indignation. Peasants and artisans were enticed to Brazil under false pretences, and upon their arrival were robbed and plundered and treated more like slaves than human beings. Besides the indignation caused by these frauds, the steady outflow of agricultural laborers from the eastern provinces of Prussia has also created alarm. So severe was the drain at one time, in 1871 and 1872, that the owners of large estates in Posen, West Prussia (province), and Pomerania, had to import laborers by the thousand from Sweden and Russia. Not only did agriculture suffer, but the efficiency of the army-system seemed to be impaired. The Government became uneasy, and procured the passage of a law making it a penal offence for any one to induce another to emigrate by holding out false encouragements or making false representations. It seems, however, that even this stringent measure has not been found sufficient. According to the terms of the new bill, the business of emigrant-agent as such is to be made punishable by imprisonment not exceeding two years, and holding out false inducements by imprisonment for not less than six months. Another feature of the proposed revision is its manifest desire to make things as uncomfortable as possible for the Ultramontanes and Socialists. The following (§ 130) applies to the Socialists:

"Whoever attacks, publicly or in writing, the institutions of marriage, of the family, or of property, in a manner to jeopard the public peace, may be punished by imprisonment."

The next section of the paragraph is for the special benefit of the Ultramontanes:

"A pastor or minister of religion who, in the exercise of his functions, whether in church or in a place set aside for religious meetings, shall discuss state matters in the presence of a multitude or make them the subject of a pastoral announcement, in a manner to jeopard the public peace, may be punished with imprisonment for a term not exceeding two years. The same punishment is applicable to writings."

The electoral law providing the manner of forming the Lower House under the new constitution, is now under full debate in the French Assembly. The great matter in dispute—the size of the electoral districts—is fully explained in our Paris correspondent's letter. The progress reported thus far is the passage by a large majority of a clause making two years' residence in the district one of the qualifications for voting, which, if it tells against anybody, tells only against the Radicals of the great towns, who are a roving race. There is still more or less discussion in the Cabinet over the *scrutin de liste*, but M. Buffet will doubtless carry the day against it, while the Radicals are said to be talking of an alliance with the Extreme Right in support of it. The latter would probably favor it simply as a means of lessening the influence of the Government on the elections, and thus leaving a greater number of chances open for monarchy in the constitution of the first Assembly. But whatever happens on this point, it is certain that genuine progress is being made in France every week in laying the foundations of a strong and permanent government. The slow discussions of the last two years, with order sternly maintained by a man whose ambition no one suspects or fears, have done a world of good in familiarizing both the politicians and the people with the processes of rational politics; and the establishment of rational politics in France will be a great gain for Christendom. The thing for us to "hail" in France, as elsewhere, is not republicanism or monarchy, or any other external form of government, but the rule of right reason—the ascendancy in public affairs of mind over brute passions and idle fancies.

The Berlin correspondent of the London *Times*, who is unusually trustworthy and well informed, is reported by the Cable as having asserted that the conferences between the representatives of the Great Powers which have taken place in Vienna, have resulted in a determination to ask Turkey what guarantees she proposes to offer that reforms will be carried out any better hereafter than heretofore. She certainly cannot offer any which will not involve a greater or less amount of foreign interference, and foreign interference in the present state of the finances would have a strong tendency to grow and spread and become permanent—or, in other words, to put the Sultan under a protectorate which would virtually end his rule in Europe. The news is naturally causing considerable perturbation in financial circles, and, coming close on the late funding of the coupons, is producing deep depression on the London Stock Exchange. The interference, if any takes place, would of course have to be joint, and joint interferences, when all the parties are greedy, are very apt to end in a quarrel. Among the possible results of anything of the kind now talked of is the occupation of Egypt by Great Britain, as a guarantee for the security of her communication with India, in case of the appearance of Germany or Russia in heavy force on the Bosphorus. The Khedive is so frightened that he has asked to have a commission of English accountants sent on to examine and report on his finances.

## THE ELECTIONS.

As a general rule, it cannot be said that newspaper explanations of election returns have a highly scientific character. Properly speaking, a person competent to show exactly why an election has gone in a certain way would have been competent to predict before it occurred exactly how it would go; but we need hardly say that political prophets, though numerous, are but feebly inspired, and are apt to be loose and unreliable in their speech. Commentators on returns, too, have a great deal of human nature in them, and are, on the whole, a cheerful race. There is hardly any vote out of which they do not manage to extract comfort and in which they do not find a solemn warning for their opponents. On trying to get at the meaning of the late elections, therefore, we make no profession to be able to say what was the exact reason of the cutting down of the Democratic majority in this State, nor are we competent to tabulate the lessons of the struggle under either Roman or Arabic numerals, as some of our deep-seeing contemporaries have done. One thing, and one thing only, is certain about an election, and that is, that the voters of the majority were actuated by a variety of motives, and that the result, therefore, was due to a composition of causes. That the hostility of the Canal Ring, which has long been and still is a great force in State politics, to Mr. Tilden had something to do with the reduction of the Democratic majority, there can be little doubt; how much, nobody can say. That his warfare against the Ring did not draw more Republican votes to his ticket is doubtless also due in some degree to the air of humbug which has been given to all Democratic activity, even in good causes, by Democratic folly in other States; but in what degree, who can tell? In like manner, Kelly owed his defeat in this city partly to the iteration of the majority of the newspapers that he was a Boss, and that all Bosses were bad; and partly to the deeply-rooted feeling, bred by old association, that every ticket got up by Tammany must be bad; and, though last not least, partly to the dissatisfaction of the Short-Hairs, led by Morrissey, with the policy of the Swallow-Tails, represented by Tammany Hall, in cutting down the wages of city laborers to the market rate. In what proportion these agencies contributed to the result we do not pretend to say, but that they all contributed to it, and that nothing else did in any perceptible degree, is reasonably certain—certain enough for some practical conclusions as to the difficulties which just now attend any attempt at reform.

It is quite evident, in the first place, that there is not much to be expected in that direction from either of the great parties as such. The Republican party, as now managed, has no stomach for much work of the active kind. That it should be expected to have it is something curious. Parties are formed by men who are intensely interested in a particular question, or set of questions, connected by some close and palpable bond. When they become large enough to secure the power of the State, they are naturally led by such of their members as add marked ability to this strong interest in the subject on which the organization sprang up. As long as the interest lasts and the original object remains unattained, the party has an ardor for legislation in the direction of this object, and its chiefs are naturally the most enthusiastic promoters of this legislation, and are not only willing but eager to occupy themselves in preparing it. But the object once attained, it is useless to expect that the chiefs will turn to a new subject with the vigor and activity necessary to impel so ponderous a body as a party on a new path. They are either old or tired, or are new men who have taken up the party as a mere matter of business, or as a stepping-stone to office. In either case, whatever line of policy they pursue must be one forced on them by public opinion; and if it were strong enough to do that, it would form a new party altogether. The Republican leaders of to-day, and especially the "Senatorial Group" which since 1870 has been in charge of the party, are not anxious for new enterprises. They are not interested in finance, or the tariff, or civil-service reform. They like things as they are, and, if they are called on to define their position or duties, will say that they are "standing guard over the results of the war," and are especially engaged in keeping the Democratic party out of office. The irritation caused by this led to the Republican defeats last year, and the fact was then revealed that the Democratic party, as such, also had no policy, and was fishing about, as in 1872, in search of something sensational. As it is their offences which are just now fresh in the public mind, the Republicans have been able to achieve slight successes—enough to save them from dissolution, though not enough to clothe them with any additional power or responsibility; and their condition will perhaps be still further improved during the winter by Democratic excesses in Congress. But there is not the least probability that any of these contingencies will put the Government in hands strong enough for the active treatment of any of the problems now before the country. This can only come in the old way, from a union of men to whom these problems possess the highest interest, whose imagination is excited by them, and who are, therefore, willing and anxious to work for them—not simply stimulated by the public, but stimulating it.

In this city we have had the same state of things on a small scale. The Tammany Society, which has charge of the Democratic party in this city, and is a sort of permanent convention formed of delegates from the various districts, has of late been trying to bring about reform within the party. It has taken into the organization as many respectable men as its constituency would stand, so many, indeed, as to earn for it, in the eyes of the rank and file, the character of an aristocratic concern which had no sympathy with the masses. It, at the same time, drove out Morrissey and some of his following—men perhaps not much worse than some who were retained, but more conspicuously vicious and depraved, and more audacious in their contempt for morality. The portion of the party which Tammany represented also undertook the abatement of what is perhaps the greatest evil in the city government—the practice of paying the laborers on the public works not what the market prescribes, but what they or the politicians pronounce sufficient. Nevertheless, such was the effect of certain names and traditions on the public mind that the principal newspapers and reformers at once raised the cry of "Anything to beat Tammany," and joined forces with Morrissey and his Short-Hairs, suppressed all facts or charges which threw discredit on them and their candidates, magnified all the counter-charges, and ended by winning a victory by which Morrissey, an ex-pugilist and professional gambler, has been converted into the reigning "Boss," *vice* Kelly overthrown. For reform itself nothing has been gained, while one positive reform has been stopped short. No city official will again attempt to pay the proper rate of wages, and the allegiance of the class who supported Tweed to the last, and to whom Boss government is as good a government as they desire, and who form the soil on which municipal corruption grows, has been turned from Kelly to a far worse man than Kelly, and with the aggravation that this man has received what Kelly never received, the support of persons calling themselves municipal purifiers. The satisfaction with which some of them regard the result of their labors may be fairly called fatuous. The one good thing in it is really the increased want of confidence it has created in the effect of any party nomination. Both the Short-Hairs and the Swallow-Tails will hereafter feel that a nomination is less certain than ever to lead to election, and this is undoubtedly a gain; but it has been dearly bought by the elevation of Morrissey to the rank of a Boss. It is, of course, impossible to believe that this state of things can continue. The honest and patriotic men of the two parties can hardly keep up indefinitely a game of mutual distrust which prevents any possible advance being made by either, and renders our political struggles as senseless and fruitless as the Italian wars of the Middle Ages.

## VOLUNTARY RESUMPTION.

We have several times called the attention of that part of the business public which is really anxious to get back to specie payments to the fact that the matter is, to a great extent, in their own hands. All that persons who make contracts of any sort run-

ning for a long time—that is, trustees, real-estate owners or agents, capitalists investing money—have to do, if they want to return to a specie basis, is to make their contracts payable in gold. Under the Legal-tender Act, and the interpretation given it by the Supreme Court, there are now in the United States two kinds of currency, both of which are legal tender, one of which might be called "soft," the other "hard," tender. Both of them are recognized by law; either of them will satisfy a debt. With the reasoning on which this law is founded we have nothing to do. It is the settled law of the country, from which there is no appeal. It is also well-settled law that specific contracts may be made payable in gold dollars, and that in such cases the courts will enforce them. Therefore, as we say, it would be easy for large classes of people to introduce the practice of making contracts like these; and they have already been introduced to a certain limited extent, as in the case of railroad bonds, the interest of which is made payable in gold, and in some private transactions.

The obstacle, however, to a general voluntary return to specie payments by this means obviously is that in the great majority of transactions between man and man in the ordinary business of every-day life—the hiring of labor, the purchase of food and clothing—there are no written agreements or contracts at all, and in all these cases the undertaking to pay so many "dollars," under the construction given by the courts to the legal-tender acts, is satisfied by the payment of paper dollars. In other words, in the absence of any written declaration to the contrary, the law says that the *presumption* is that the contracting parties meant paper. It cannot be denied, either, that this presumption is founded in fact. Since coin has entirely disappeared from common circulation, the meaning of "dollar," in the ordinary acceptation in the United States, has changed, and instead of meaning a certain number of grains of gold of an ascertained weight and fineness, it signifies a piece of paper issued by the Treasury Department 7⅜ inches long and 3½ inches wide, green in color, and bearing on its face a promise to pay a "dollar." The newspapers do, indeed, quote paper at its value in gold, and gold at its value in paper, but there is no doubt that in the ordinary transactions of this country the word "dollar" means what the Supreme Court says it does.

The legal difficulty, then, in the way of any voluntary return to specie payments is the existence of a presumption, both of fact and law—we do not use these words in any technical sense—which itself enters into the meaning and settles the value of all agreements; and the question is whether there is any way to get rid of this presumption, and if so, what way. Practically, too, as long as the United States had fixed no definite time for the resumption of specie payments, there was the serious obstacle that any attempt to do away or interfere with the operation of this presumption might bring any State attempting it into collision with the courts at Washington. This stumbling-block, however, has now been removed by the passage of the Resumption Act of last winter, declaring that on and after the 1st of January, 1879, the United States will redeem its notes in coin. This act is a formal notice to all the world, as long as it stands unrepealed, that on the 1st of January, 1879, the word "dollar" will no longer be construed by the courts as meaning the promise of the Government to pay a dollar, but will mean again what it had ceased for fifteen years to mean—a certain specified number of grains of gold. In other words, the United States has now given formal notice to all the world, including its own citizens, that on the 1st of January, 1879, the presumption now existing will be at an end.

There is clearly, then, nothing in the laws to prevent any one of the States, or any number of them, from accommodating themselves to this new state of facts. There may, it is true, be some doubt whether any State action is necessary, and whether the passage of this law itself does not effectually prevent the courts from recognizing, after January 1, 1879, any dollar but the hard-money dollar. But the act may be repealed, and courts may render, as they have done before, singular decisions, and it is important, if we wish to bring about resumption, to guard against chances of this sort. There is one way of doing this which seems open to no objection.

The presumption as to the meaning of the word dollars which now enters into the meaning of contracts may, as we have said, like any other presumption, be rebutted by facts. That is, if A and B make a contract, payable in "dollars" even now, which B attempts to satisfy by a payment of paper, and thereupon produces a contemporaneous contract made between himself and A, stipulating that in all contracts between the two the word "dollars" shall mean the gold or silver dollars issued by the United States Mint, of a certain weight and fineness, the courts would be obliged to say the general presumption that "dollar" means greenback is rebutted and reversed by this stipulation, and judgment must be given for a certain number of gold and silver dollars. If, then, the general presumption could in any way be reversed in some such way in all contracts, the desired end would be attained, and any State which should succeed in doing it would, by the very act, return to specie payments.

There is only one way in which this can be done in any State, and that is by an act of the legislature; and in New York the last legislature did pass such a statute, in the following terms:

"SECTION 1. All taxes levied and confirmed in this State on and after January 1, 1879, shall be collected in gold, United States gold certificates, or national-bank notes which are redeemable in gold on demand.

"SEC. 2. Every contract or obligation, made or implied, and payable in this State, and made or implied after January 1, 1879, and payable in dollars, but not in a specified kind of dollar, shall be paid in United States coin of the standard of weight and fineness established by the laws of the United States at the time the contract or obligation shall have been made or implied."

The passage of the act, taken in conjunction with the Resumption Act of Congress, amounts to this: the United States has given notice to all the world that, after the 1st of January, 1879, it will resume payment of its unredeemed paper, which therefore will be equal in value to gold. This removes all question of two kinds of currency, and destroys the presumption heretofore existing that "dollars" means promises to pay dollars. The community in New York, therefore, ratify the act, and declare that, after the date mentioned, not only shall the presumption be destroyed, but it shall be reversed, and "dollar" shall mean "dollar" and nothing else. On familiar principles of law, every merchant, banker, broker, trustee, investor, and capitalist, after January 1, 1879, has notice of this act, and must conform his operations to it. If he says nothing as to the kind of dollars he prefers, he means gold; if he prefers paper, he must insert a clause in his contract to that effect, and then, instead of the ordinary currency being paper, and people having to go out of their way to fix a gold standard, the standard will be gold and silver, and people will have to go out of their way to bring paper in. In short, the passage of the act inserts, in all contracts made after January 1, 1879, by operation of law, such a clause as we have supposed inserted by A and B in their contracts by private agreement.

There is no reason why other hard-money States should not adopt such a law, and in this way exert a pressure on the authorities at Washington which would be irresistible. The great recommendation of such laws would be, that they appear to be binding as to all future contracts, no matter what folly may be committed by Congress, and their passage by a number of States would be perhaps the most convincing proofs the hard-money party could give that they are in earnest. It is pretty evident now that, if we mean to resume, it must be at the time now fixed by Congress, for the revival of business which is certain to come before then, and the bank inflation which must necessarily follow, will otherwise put off the time indefinitely. Inflation, as a popular cry, is no doubt dead for the present; but, for that reason, what is needed now is not scathing criticism of the lunatic proposals of Butler, Kelley, Phillips, and Allen, but positive legislation.

## M. BUFFET'S ELECTORAL POLICY.

PARIS, October 22, 1875.

IN France a political situation always becomes personified in an individual. The man who represents the present condition of the Government, and has become the centre of attack for the Opposition, is M. Buffet, the Minister of the Home Office. Marshal MacMahon's power has been placed above competition for five years yet; he enjoys for a time the privileges of a constitutional king; his name is never pronounced without some commonplace epithets; he is even more respected, at least to all appearance, by the Radical papers than by the Conservative press; he is the stern man, of few words, who commands the French army and who took Paris out of the hands of the Commune. The Republicans call him the President with an affectation which is calculated. The salons of the Presidency are now visited by men of all parties; they are a neutral ground, where you can meet all the men who have either framed or accepted the new constitutional laws. The Wallon constitution, as it is sometimes called, is now become the law of the land; it has been discussed and adopted by a sovereign assembly, and, though it is the work of a monarchical assembly, or because it is the work of such an assembly, it is not a bad solution of the constitutional problem, such as it was presented to the French nation after the failure of the monarchical solution caused by the folly and the obstinacy of the Comte de Chambord.

To M. Buffet has been confided the task of running this new machine. The Assembly had chosen him for its president a few weeks before the 24th of May and the overturn of M. Thiers. It may be said that M. Buffet really did more for the overthrow of Thiers than anybody else. He did not, like the Duc de Broglie, speak—he acted. He determined MacMahon to keep himself in readiness and to assume the executive power. The Duc de Broglie and M. Buffet were both convinced that under the Thiers régime the progress of radical, communistic, and anti-religious ideas was becoming alarming. M. Buffet was no enemy of republican ideas; he merely understood a republic in a different sense from M. Thiers. He was born in the Department of the Vosges, among the honest and hardy populations of those mountains; his life has always been virtuous, even austere; he has a large family of children, and little fortune; he is a devout Christian, and is not, like many other men, ashamed to go regularly to church. His religiosity is the key-note of his character; he never was, in a sense, a party man; he always made war on the party in which he perceived the strongest tendency towards irreligion. He entered the Republican Assembly of 1848, and attached himself to General Cavaignac after the dreadful insurrection of June, in which an Archbishop of Paris fell a martyr. It may be said that his political ideal sprang out of the bloody barricades of that epoch. He once said to me: "It is a great mistake to believe that France has many party men; of course there are some. Each party has a sort of staff of brilliant writers, talkers, lawyers, etc.; but these staffs have no army to command. Beneath them lies a great nation, which likes quiet, order, commerce, agriculture—which is easily frightened, which knows not how to defend itself against revolutionists, but which hates revolutions. Now, it is the misfortune of the Republic that this quiet and peaceable nation has identified its name with the name of the revolution. In order to live in France, a republic must be more conservative than a monarchy, more orderly, more repressive, more severe, more austere, more religious. If ever circumstances allow the establishment of such a republic, it may live; if it has not these characteristics, it must end perforce in anarchy and in despotism." M. Buffet's whole system of government lies in these words. He represents at present the hard, austere republic. He does not play with fire—he extinguishes it, or tries to; he does not coquet with the radicals—he shows them his unmitigated contempt; and his honest and sincere horror of the Commune arises not from any political feeling—it is with him a religious sentiment. He really has a great horror for the men who took priests as their chosen victims; he will not form any alliance with them, and he is always guarding himself against those who do not draw a well-defined line between conservatism and radicalism. One of his axioms is that the men who kill and burn, and make barricades, and boldly unfold the red flag, are not so dangerous as the men who slowly and systematically corrupt public opinion, who have no vigorous horror of anti-social doctrines and men.

At a time and in a country where strong personalities are rare, M Buffet may be regarded with much interest. He is a far abler speaker than the Duc de Broglie; he holds the same views in politics; he has the same contempt for popularity. The Duc de Broglie has a singular talent for making personal enemies which M. Buffet does not possess. There is no impertinence, no pride, no hauteur in the present First Minister: he is the most modest of men, and there is such a deep and quiet sincerity in him that his enemies cannot *hate* him personally. This sort of impersonality, which is one of the essential attributes of a statesman, gives to M. Buffet a very eminent position in the Assembly; there is probably not a member of it with whom he is not on speaking terms. However, his turn has come. He threw himself in the front of the battle, and the whole force of the revolutionary party is now directed against his person. It is one of the rules of war that you must never have more than one objective at a time. The great strategist who directs the Opposition first chose the Duc de Broglie as an objective; the Duke is down, and it will be long before he can recover his prestige. Now, M. Buffet must be assailed. He knows it; and as he has no longing for power, he has come forward and offered battle himself to M. Thiers on the great and vexed question of the *scrutin de liste* versus the *scrutin d'arrondissement*. There remains but one constitutional law for the Assembly to make before it separates. The President's powers have been defined; the Senate has been organized; there remains now to make an electoral law for the choosing of the members of the Lower House. It may be said that the history of the present Assembly has been a long duel with M. Thiers. Even when he is not seen, he is always there. M. Thiers once was a partisan of the system which gave a deputy to each electoral district; this system, which goes under the name of *scrutin d'arrondissement* (as the French electoral districts have long been the arrondissements or administrative districts of the department), formed a part of the system of republican laws which M. Thiers presented to the Chambers some time before he fell from power. How is it that now M. Thiers has become a convert to the *scrutin de liste*, which gives to each elector in a department the right to vote for five, six, seven deputies, which gives to the Parisian the right to vote for sixty deputies, to the man of Lyons the right to vote for fifteen, etc.? It is partly because the leader of the Opposition cannot agree with the head of the Government; it is also because the Republicans distrust the rural population and prefer the *scrutin de liste*, as it gives much influence to the cities. It is only in the cities that committees can be formed and lists prepared, which are then scattered throughout the departments. In the *scrutin de liste* system, it is thought that the rural vote can be forced by the leaders of parties: in the *arrondissement* system, the rural vote is free, as a peasant has only one deputy to choose and not a list to make. The Republicans see in the *scrutin de liste* a sort of evasion of universal suffrage, and they dread universal suffrage in practice as much as they admire it in theory.

M. Buffet has tied his fate to the system which is the most simple and elementary expression of universal suffrage: each district of so many inhabitants will choose its deputy; nothing can be clearer or more republican. He throws himself directly on the common-sense and on the good sense of the country, and tries to give as little play as possible to the action of the politicians. In one sense, Buffet's plan is the most republican: his system of voting is the primary, elementary, atomic system. He is convinced that France, left to herself and voting intelligently (in his opinion the only intelligent mode of voting is to vote for one representative only in a district), will return a Conservative Assembly, which will allow him to run smoothly the constitutional machine. The *scrutin de liste* would undoubtedly become a powerful engine of opposition in the hands of bold and unscrupulous leaders; for it would allow them to try the system of plébiscites, which has always proved fatal to liberty. If each arrondissement of France is allowed to choose a deputy, it will be very difficult to persuade two or three hundred arrondissements to deprive themselves of any real representation and to cast all their votes for the same man, be it Thiers or Gambetta. Local and individual ambitions would be too much offended by such an arrangement. If, on the contrary, each party can in every department make a long list, and the local ambitions be inclined to place themselves under the protection of some great name, such a name will act as a flag does on the eyes of soldiers. It would be very easy for M. Thiers at present to place his name at the head of every Republican list in every department. A general election under such circumstances would hardly be the mere routine of popular representation; it would become a duel between two great names, or perhaps some sort of triangular fight. Nothing can be imagined more contrary to the true essence of republican institutions than this sort of artificial prominence which the *scrutin de liste* would give at once to a few men in the country. The Republic would soon be like a carrion torn by vultures.

The chief objection which is made to the *scrutin d'arrondissement* is this: this direct and local representation will give us a *rural* Chamber. "Rural" has become almost an insult in some mouths. Our Radicals never say:

"O Rus, quando te aspiciam."

I confess that a rural Chamber does not much frighten me. France has gone so far in the path of democracy that she may well stop awhile or advance slowly. There is no country in the world where the laws are more equal, where the suffrage is less restricted, where local corporations, where privileges, are so rare. Our Assemblies have always been too much inclined to make or to favor revolutions. The Republic needs a rural Chamber more than a monarchy ; the more rural it is, the longer it will live. The old Republic, with the red flag and Phrygian cap, sword in hand, was decidedly not rural enough. Our people would like something very different from the virago so well painted by Barbier in his 'Iambes.' Gambetta, who has a fine southern intellect, understands this better than M. Thiers. M. Thiers's passion has made him blind. He said publicly at Arcachon that we need not be so much afraid of Radicals ; that Radicals in power are very much like other men. He had better read his own 'History of the French Revolution' to find Radicals in power who were not exactly like other men. But he still hopes to upset MacMahon, and he must have the Radicals on his side. MacMahon will not be upset, and his Conservative, rural Republic will live longer than our Radical republics of the past.

## THE NEW UNIVERSITY SPIRIT IN GERMANY.

October 5, 1875.

In a speech delivered before the "General Convention of German Catholics" in Freiburg-im-Breisgau, Bishop Ketteler declared : "We must conquer the liberty of science and of learning. It must become with us as it is in France. This is our highest task, else the science we must come to will be a science which teaches absolutism." The views of your French correspondent concerning the law on "the liberty of science and of learning," as Bishop Ketteler is pleased to call it, have been upon the whole rather favorable. I do not think myself entitled to take issue with him on this question in the columns of the *Nation*, but I venture to assert—and this statement will be of interest to your readers—that it would be very hard to find, outside the Ultramontane circles, a single educated German who shares these views. A distinguished American professor, to whom I expressed this opinion the other day, seemed greatly astonished. I explained : "You are mere doctrinarians in judging this question ; it is we who have received for over three centuries the fearful lessons of experience. You have read and you have heard what Ultramontane Rome and the Jesuits are; it is we who have felt it. With you they have had as yet no chance to drop the mask completely, and no one knows better how to bide his time. We have not suffered in vain, and we do not mean to entail new and greater sufferings on our children for the sake of a shining but narrow and one-sided theory." Nothing was proved by these words, but the professor answered, with a thoughtful mien : "You may be right, you may be right." There I may leave the matter ; for you have since furnished the argument which I gladly accept as the solid foundation on which to rest my exclamations. No reflecting reader will find it difficult to apply the reasoning of your article on "Priests and Ministers" (Sept. 16) to the question at issue.

But however that may be, one thing is certain: Bishop Ketteler's "highest task" will never be fulfilled ; it will never be with us as it is in France ; we shall never have this liberty of science and of learning. I shall not attempt to enumerate all the reasons ; for that would require a volume. I shall mention but one : ere this could be accomplished twenty fortresses would have to be razed to the ground. In two respects, our universities are bulwarks too strong to be levelled by either the craft or the violence of the Ultramontanes ; they can neither kill the spirit reigning in them nor can they raise the means necessary to compete with them in any particular. For the latter reason, indeed, an attempt similar to the exertions now put forth in France once signally failed, and if another attempt should ever really again be made in Germany, it would undoubtedly fail as signally. Our main reliance is, however, the spirit reigning in all our universities, though we are, happily, far from resting on our laurels in this respect. It has often been said that the real victor in the war of 1870–71 was the German schoolmaster. There is certainly some truth in this ; but all our best men are agreed that in several and very important points our schools of all degrees and descriptions are far from being what they should and might be. Every day we see clearer that in this respect, as in so many others, we are in the midst of a crisis, and that it will require our most strenuous exertions to bring the ship safely into port. The enormous political revolution Germany has undergone during the last decade has, of course, to some extent pressed the school question into the background, but it has not been able to crowd it out of the order of the day. There has even been a close connection between the two, the latter constituting a factor of the greatest importance at a very critical juncture in that general political revolution. So long as Von Mühler stood at the head of public education in Prussia, Bismarck's work was but half-done, and the main guaranty for its duration was still wanting : a generation moulded after Von Mühler's own heart could not fitly be entrusted with the achievements of our day. The overthrow of this Minister was, in fact, the "inner Sedan" which has been so much talked about in our parliamentary bodies and in the press. It is both harder and requires much more time to reap the fruits of this victory than of that won by the sword. The new school-law is thus far only a promise, and though one is justified in expecting that the bill which the Government is to bring in will be, in the main, dictated by a truly progressive spirit, yet there are many who would not be astonished at all to find in it a great number of not unimportant flaws. Happily, this is a field where with us public opinion is of more weight than perhaps in any other. Though the personal merits of Bismarck in the overthrow of Von Mühler are unquestionably great, yet this was principally due to the force of public opinion, and there is no reason to fear that public opinion will now begin to slacken its exertions. Here is the best proof that as a nation we have as yet escaped the danger of revelling in a wild and blindfolded *chauvinisme*. It cannot be denied that a considerable part of our youth, and especially those who were boys during the late war, have been attacked by this worst of all political diseases in a degree to make it a matter of grave concern to the reflecting patriot. Those who have stood the brunt of the fight, and more particularly those who for about thirty years have helped to sow the seeds from which Bismarck's genius has reaped so rich a harvest, are, however, upon the whole sound, and they have still the possibility of impressing the stamp of their own minds upon the growing generation. This is what they consider "our highest task," and they are fully alive to it. Not only has Dr. Falk time and again been urged to hasten the preparative labors for the new school-law with the utmost energy, but also the best minds of those who are immediately charged with the education of the country's youth are constantly busy seeking solutions of all the great problems. *Gymnasien* and *Realschulen*, the proper relation of the two towards each other, reforms in both of them within their own sphere, are as zealously and, I think, more thoroughly discussed than was the case with the before-mentioned law in France. The opinions of the "authorities" differ widely, and so far as my—I confess very limited—knowledge goes, we shall probably have to say for a very long time to come with the Roman poet, "et adhuc sub judice lis est." There is, however, nothing discouraging in this. The principal thing is evidently the all but general conviction that we cannot rest contented with what we have, and the arduous struggle to find the way to something better. This is in itself a guaranty that, sooner or later, we shall come—not to anything definite, for to believe that we had attained that would be our death-warrant—but on to somewhat firmer ground, so that the main questions may be considered as settled for a while, and the attention with safety be turned to the details

What I have said of the middle schools, as we call the *Gymnasien* and *Realschulen*, also applies to the universities. As to these, I feel myself more competent to speak, and the frequent allusions made in your paper to our high schools warrants the belief that it will be of interest to your readers to hear something about them from one who has the advantage of constant personal observation, and who is frequently brought into contact with university professors from all parts of the country. I intend, with your permission, to send you at irregular intervals—*i.e*, when no political questions of paramount importance call for a letter—some articles on the principal features of our university education, so far as they are subjects of controversy or at least of discussion among ourselves. My own views shall not be pushed to the foreground ; I shall try to give you an impartial statement of the opposing opinions, estimating, as far as possible, their relative strength and their apparent chances in the future. To-day I shall only remark that the amount of printed matter on these topics does not at present correctly indicate either how intense or how widespread the interest in them is. The younger professors, among whom they are generally discussed with the most earnest liveliness, have as yet forborne to argue them before the public, but are urging their older and more experienced colleagues to do so, preparing to take an active part in the discussions themselves as soon as they think they may do so with propriety and with a chance to further the cause. This, I trust, will be considered as speaking for the healthy character of the movement, and the more so as the ball has been set rolling neither directly nor indirectly by some young Hotspurs, but by some of our very first scholars and teachers. In fact, about ten years ago Professor Von Sybel, who is just now entering upon the directorship of the Royal Archives in Berlin, took up the subject in a public speech,

He may not have been the first, but the manner in which he treated his theme enforced general attention. Some years later, he delivered a second speech on it which met with equal success (both have since been published together in pamphlet form). Then Professor Mommsen raised his weighty voice at his inauguration as Rector of the University of Berlin, and quite recently Professor Jürgen Bona Meyer has followed the example of his former colleague at the University of Bonn. Finally, Professor Heinrich Fischer has chosen the same theme for his introductory oration as Pro-Rector of the University of Freiburg. This is, for several reasons, of special interest. Professor Fischer, though a highly esteemed scholar, is a gentleman of very retired habits, much more so than is common among the professors of the present day. There is no one more willing to support actively anything of public interest in Freiburg, but with the rest of the world he has uncommonly little connection. He had never heard that anybody else had ever uttered a word in public on the subject he was going to treat in his oration, so that all he has to say on it is entirely the result of his own and absolutely independent observations and reflections. Furthermore, he does not belong, like the three gentlemen named above, to what we call the *humanistische Section* of the philosophical faculty. He is a geologist, and yet he complains in stronger terms than any of them that our *Hochschulen* are losing with fearful rapidity their distinctive character as real *Universitates*, and fast approaching what we are wont so haughtily to denounce as the peculiarity of the French universities: we are in danger of becoming mere *Fachschulen*, still infusing a good amount of positive knowledge, but lacking "the ideal, higher, and poetical something which unites the circle of all nobler men by an invisible magic tie." Permit me to close this letter with another quotation from this remarkable speech. With bitter sorrow Fischer exclaims: Allow me to ask whether, "in academical study, beside the possibility of acquiring the minutest knowledge for the future profession, there should not also be kept in view other and partly *higher* considerations; whether the centre of gravity of academical study shall be entirely and exclusively in the preparation for the future *specific* position in the state and in acquiring the knowledge necessary for this, or whether the academician, destined to represent the highest degree of erudition in life, has not also a higher mission to fulfil? Nay, I want to go further, and will ask whether, under our present circumstances, the representatives of a thorough, universal, and philosophical erudition—I take it in the wider application as it can be acquired *only* at universities—will not *completely die away*, and whether it is not the special task of the present generation, being the last that has the chance, to avert this?"

# Correspondence.

## PROF. TYNDALL ON THE RUIN OF AUTHORITY.

To the Editor of The Nation:

Sir: The extremely severe handling of Professor Tyndall in the current number (539) of the *Nation* must have been very surprising to many of its readers. I have been unable to obtain a copy of the work under review, and consequently cannot attempt to refute the charges with which the article is filled. But the preface to Tyndall's work was published in the August number of the *Popular Science Monthly*, a copy of which has been put into my hands since the appearance of your review, and I have thus been made aware of the glaring injustice of the concluding portion of the latter. Any candid reader can see that the passage on which your reviewer bases such serious imputations, cannot possibly bear the interpretation which every one reading it as given in your review is compelled to put upon it. Professor Tyndall never indicates that it was the authority of *Professor Henry* that impeded him in his researches, as will clearly appear from the passage itself, which, with its context, is as follows (the italics are mine):

"The clue to all the difficulties and anomalies of this question is to be found in the aerial echoes, the significance of which has been overlooked by General Duane, and misinterpreted by Prof. Henry. And here a word might be said with regard to the injurious influence still exercised by authority in science. *The affirmations of the highest authorities that from clear air no sensible echo ever comes, were so distinct, that my mind for a time refused to entertain the idea.* On the day our observations at the South Foreland began, I heard the echoes. They perplexed me. I heard them again and again, and listened to the explanations offered by some ingenious persons at the Foreland. They were an 'ocean echo': this is the very phraseology now used by Prof. Henry. They were echoes 'from the crests and slopes of the waves': these are the words of the hypothesis which he now espouses. Through a portion of the month of May, through the whole of June, and through nearly the whole of July, 1873, I was occupied with these echoes; one of the phases of thought then passed through, one of the solutions then weighed in the balance and found wanting, being identical with that which Prof. Henry now offers for solution.

"But though it [*not* 'Prof. Henry's solution of ocean echoes' (!), but 'authority in science'] thus deflected me from the proper track, shall I say that authority in science is injurious? Not without some qualification. It is not only injurious, but deadly, when it cows the intellect into fear of questioning it. But the authority which so merits our respect as to compel us to test and overthrow all its supports before accepting a conclusion opposed to it, is not wholly noxious. On the contrary, the disciplines it imposes may be in the highest degree salutary, though they may end, as in the present case, in the ruin of authority. The truth thus established is rendered firmer by our struggles to reach it."

Nothing is here said of Prof. Henry as an authority. The sentence immediately preceding the passage quoted by your reviewer shows how little "Prof. Henry's solution of ocean echoes" had to do with deflecting Prof. Tyndall from the proper track. Indeed, such an interpretation of the "it" is not only rendered impossible by the context, but is strikingly inconsistent with your reviewer's accusation of superciliousness, founded upon Tyndall's summary mode of dealing with Henry's solution. Thus it appears that the setting up of a "man of straw" "under cover of Henry's name," existed only in your reviewer's brain, and arose from an absurd misconception of Tyndall's meaning. The "vanity, conceit, and arrogance" disappear likewise; for the discovery of new truths in science almost always involves the "ruin of authority." When we say that Newton's adoption of the corpuscular theory of light long impeded the progress of the undulatory theory, and that those who established the latter were compelled to "test and overthrow all the supports" of the former, nobody thinks of accusing us of disrespect to Newton.

As I said at the outset, I am not prepared to combat the charges brought forward in the body of the article; but enough can be gathered from Tyndall's preface to lead one to believe that some, at least, of the other charges rest on no firmer ground than the one to which I have confined myself above. Yours, very respectfully,

X.

Baltimore, November 1, 1875.

[It seems to us that the pronoun "it," as used by Dr. Tyndall in the sentence above cited, is a case in illustration of what the French call a "squinting construction"—that is, a phrase or grammatical expression which looks two ways, so that it can be connected in meaning either with what goes immediately before or what comes immediately after it. The reviewer undoubtedly thought that the "it" in question squinted at Prof. Henry's "solution of the ocean echoes," seeing that Prof. Tyndall had expressly referred to that "solution" in the sentence immediately preceding. And in support of this opinion, that the authority of Prof. Henry was aimed at, the reviewer, we presume, would emphasize with italics another passage in the paragraph quoted by our correspondent, as follows:

"The clue to all the difficulties and anomalies of this question is to be found in the aerial echoes, the significance of which has been overlooked by General Duane, and misinterpreted by Prof. Henry. *And here a word might be said with regard to the injurious influence still exercised by authority in science,*" etc.

Whether Prof. Henry is regarded as a victim to the delusions of "authority," or as a cause of delusion to others, does not appear from Dr. Tyndall's statements under this head, but the "word" which he "here" thinks it proper to say "with regard to the injurious influence still exercised by authority in science," is certainly introduced as being apropos to Prof. Henry's alleged misinterpretation of aerial echoes. General Duane cannot even share with Prof. Henry the honor of starting this train of reflection in Dr. Tyndall's mind, for the General, it seems, "overlooked" the significance of the echoes, and hence made no deliverance on the topic which could entitle him to the suspicion of being an "authority" in this matter. Unless Prof. Tyndall be the most incoherent of writers, he certainly means to include Prof. Henry in his animadversions on the "injurious influence" of authority in science. But not Prof. Henry alone. And this fact naturally leads us to say that if it be plain, as our correspondent argues, that Prof. Tyndall claims, in the present case, to have laid in ruins the authority of all former investigators, without any particular reference to the views of Prof. Henry, though he is more particularly named in the beginning, middle, and end of the whole paragraph, we do not perceive, as clearly as our correspondent, how it is that the greater amplitude of such a claim relieves it

from the imputation of arrogance. And in so saying, we venture no judgment on the justice of Prof. Tyndall's pretensions in this matter, but we may say that, so far as we know, it is not usual among men of science to herald their achievements by pointing to the ruined authority of their predecessors. If any advocate of the undulatory theory of light, to which our correspondent alludes, has ever referred to the "disciplines" imposed on his mind by the shadow of Newton's "authority," as explanatory of and preliminary to the statement that he had laid the "authority" of Newton in ruins upon this subject, we are not apprised of the fact. The reflex praise of demolished authority in science comes to its successful votaries by the voluntary suffrage of others, and is not promoted by the assertions of an analytic self-consciousness, explaining to itself and to others how it grew so great. We find it entirely fitting that the admirers of Prof. Tyndall should use the inferior achievements of other men as a foil to set off his intellectual superiority, but his acknowledged eminence as a physical philosopher would seem sufficient to exempt him from the necessity or the temptation of doing a critical homage to himself, seated on the "ruin of authority." —Ed. Nation.]

# Notes.

LOCKWOOD, BROOKS & CO., Boston, have published for the town of Lexington its very handsome volume of 'Proceedings at the Centennial Celebration.' It contains Mr. Dana's oration, Mr. Whittier's poem, and various speeches and letters; a general description of the day, a list of the relics exhibited, and illustrations of the new town-hall and of four statues —the minute-man of 1775 and of 1861, John Hancock, and Samuel Adams. It is a pity that these last should be wood-cuts, and not, like the picture of the town-hall, heliotypes.——J. B. Lippincott & Co. will publish a quarto holiday volume on 'Contemporary Art,' embracing a series of thirty etchings and chromo-lithographs after original pictures by artists of the present day, with explanatory letterpress.——A new psychological and philosophical quarterly, called the *Mind*, is to appear in England next January. The conductors are not named, but the best-known of its intending contributors are Prof. Bain, Herbert Spencer, H. Sidgwick, G. H. Lewes, S. H. Hodgson, etc.——The Congregational Publishing Society, Boston, will shortly issue 'Memorials of Charles Stoddard,' by his daughter, Mrs. Samuel Johnson; 'The Prayer-Gauge Debate' of Prof. Tyndall, Francis Gaston, and others, against Dr. Littledale, Dr. McCosh, the Duke of Argyll, Canon Liddon, and the *Spectator;* and a new revised and enlarged edition of Mr. Edwin Buck's 'Ecclesiastical Law of Massachusetts,' a work of permanent interest and importance.——The *New Englander* for October contains a 'History of the Cardiff Giant Hoax,' by W. A. McKinney. We commend it and the summary disposal of a libel suit against the Boston *Herald*, involving the genuineness of the statue, to Dr. Schlottmann and other believers in the "Phœnician Adonis." These incidents may even seem worth a paragraph to the *Academy*.——The greater part of Colonel Wm. Ludlow's 'Report of a Reconnaissance of the Black Hills of Dakota' (Washington: Government Printing Office. 1875. 4to, pp. 121) is occupied with the contributions of his civilian assistants to the geology, palæontology, botany, and zoölogy of the region explored in the summer of 1874 by the "Custer Expedition." This confers a permanent value upon the volume which the engineer's report alone would not have had, important as this may be for the special purposes contemplated. Professor N. H. Winchell and Mr. George Bird Grinnell are the principal contributors to the work, the former in geology and botany, the latter in the other scientific branches above-mentioned.

—Professor Henry's Smithsonian Report for the year 1874 gives a good account of the management and varied usefulness of the Institution. Among the publications in progress or contemplated are a "complete index to all the species of plants of North America, with their synonyms and all descriptions and important references to them"; a new and enlarged edition of Schott's 'Tables of Rain and Snow in the United States'; a general discussion of the winds of the globe; a discussion of all the observations made on the temperature of this country from the earliest times; and a work on the geographical distribution of our thunder-storms. The National Museum is receiving most important accessions in all its departments. Two of its many sources of supply are Mr. Barnum, who makes over to it all the animals in his menagerie which die on his hands, and Mr. Blackford, a fish-dealer in this city, who secures all the rare and odd fish that come to this market, and sends them packed in ice to Washington. From these casts are taken, and the Institution has now a series of more than three hundred casts of our food-fishes, painted carefully from nature. What has been done to foster fish-culture, and to improve the system of fog-signals in the United States, is duly recorded. The papers which usually accompany the Report and give it a permanent value are in this case Arago's eulogy on Laplace, Mailly's on Quetelet, and Dumas's on De la Rive; Prof. Hilgard's interesting lecture on tides and tidal action in harbors; De Candolle's notable chapter advocating the English as a dominant language for science; a translation (continued from the previous Report) of Morin's elaborate treatise on warming and ventilation; and a letter, by Prof. Warren du Pré, on the so-called North Carolina earthquakes, which literally "made so much noise" in February and March of last year. It appears that the shakes and explosions in or about Stone Mountain were really not due to quarrying in the neighborhood, and this must be a great comfort to the forty-five new members who were added to the Baptist church in consequence of them. Prof. Du Pré attributes them to volcanic or earthquake energy, but Prof. Henry inclines to think them caused by either a gradual depression or elevation of the mountain. The stories of issuing smoke and flame were fabulous. The last sixty pages of the Report are given up to Ethnology, with a view to presenting as complete information as possible concerning the location and character of ancient earthworks in this country. The accounts here given range from New York to Oregon in one direction, and to Florida and Mississippi in others. Most noteworthy in this Report is the curious fact that for the first time since its establishment the Institution has received a bequest from which something has been realized, viz., that of Mr. James Hamilton, of Carlisle, Pa., who gave $1,000, with liberal directions as to the use to be made of the interest upon it. We cannot think that this example will long go uncopied.

—The *Galaxy* has an article on the two Ampères, by Mr. H. James, jr., which will repay reading, though the extraordinarily sentimental character of the Ampère love-affairs may repel or at any rate puzzle the Anglo-Saxon reader a little. The friendship of young Ampère for Madame Récamier, a woman old enough to be his mother, is not perhaps so remarkable, nor her encouragement of him; but the manner of French love-affairs or friendships is always so different from that of the English, that when we find Ampère at twenty-five suggesting on the spur of the moment to Madame Récamier, then forty-eight, and with a husband in excellent health, that should her husband die, and she think of remarrying, they might marry each other, the reader hardly knows whether to rub his eyes and wonder how this tale got into print, or to murmur "very pretty," "very French," and regret that the ardent lover seems to have displeased Madame Récamier by the suggestion. There is no doubt a radical difference between the "Anglo-Saxon" and the Latin races on these points, as may be very distinctly seen in the difference between the traditional lover of the French stage and the remarkable travesty of human nature who takes that part usually on the English-speaking stage. In this number of the *Galaxy* Mrs. Edwards brings to a termination her tale, called 'Leah, a Woman of Fashion,' so that we shall be spared any more of "Jack" and "Debby" and Leah herself, and Danton and Lord Stayne, and the rest of the motley throng who people her pages. "Jack" of course dies, fondly imagining that he has outwitted his faithful wife and physician by leaving his money away from her in the event of her remarriage. Danton and Leah, however, care nothing for money, and immediately marry, as anybody but a fool like Jack could have seen they would. Then Leah dies, leaving Danton, we suppose, broken-hearted. There is no real reason for his being so, for Leah was not a wife to love much after all. The whole story is irredeemably vulgar and unreal. The "fashion" which Mrs. Edwards describes is that kind of fashion in which the world at large is transcendently venal, corrupt, and debased, in which all mothers sell their daughters, all husbands drink, gamble, and beat their wives or desert them, all old noblemen are satyrs, and the moral code in vogue seems to have been dictated by the devil in person; all in order that some one or two of the characters may move about in this precious society as angels of virtue and holiness. There is no such world anywhere that we know, and we do not believe Mrs. Edwards knows of any either.

—The last number of the *Law Review* contains an article giving the history of the title to a piece of property in the "Burnt District" in Boston of more than professional interest. In 1860, this piece of land was in the possession of Mr. William Ingalls, holding it under the will of his father, Mr. Thomas Ingalls, who had died in 1830, leaving it to his wife for

life, and at her death to his son. He made his son also residuary legatee of his other property, directing his executor, however, to pay to his two nephews, William and Arthur Jones, a legacy of $25,000 apiece. Unfortunately, Mr. Ingalls, the elder, though a rich man at the date of the will, died having no money for the payment of these legacies, and his only property, the real estate, passed into the hands of his widow for her life. She died in 1845, when the son came into possession, the property meanwhile gradually increasing in value, till in 1869 it had become worth $135,000, and promised to increase still more, when one fine morning Messrs. William and Arthur Jones advanced a claim that the estate be sold at auction and the proceeds applied to the payment of their legacies, which now amounted, with interest, to $143,000. Mr. Ingalls, on consulting counsel, was surprised to learn, first, that there was in Massachusetts no limitation, by statute, of the time within which an action for the recovery of a legacy could be brought; and, second, that as his father's will gave him, after his mother's death, the same interest or estate in the property that he would have had if there had been no will at all, in the eye of the law the devise was void, or no devise at all, and his piece of real estate was liable to be sold for the payment of the legacies. This view of the subject taken by the law was of course contrary to the clear intention of the will, and it may be supposed that Mr. Ingalls, with one of Dickens's characters, came to the conclusion that if the law looked at it in this way "the law was an ass," but, nevertheless, he was obliged to see the property sold and bought in by the unrighteous Joneses, and to deliver possession to them of his inheritance. This, however, was only the beginning of the drama, for the Messrs. Jones had hardly stepped over the threshold when they were served with a summons to answer a suit brought against them by one John Rogers for the recovery of this very property. They would have been startled by this, but, as they had caused the title to be examined as far back as the beginning of the present century, they felt pretty secure in their ill-gotten freehold. But the avenger of blood, John Rogers, had been much further back, and had traced his title up to the first half of the XVIIIth century, when it belonged to one John Buttolph, who entailed it upon his brother Thomas. Thomas died in 1775, leaving an only daughter, Mary, wife of Timothy Rogers. Now, Mrs. Rogers, apparently making the mistake of supposing that the law of entail was, among other relics of feudalism, obsolete in Massachusetts, devised the estate, and so it passed into the hands of the Ingalls family. By law, however, the title passed, under the entail, to her eldest son, Peter, who lived till 1854, when he died at the age of seventy-five, leaving no children; and John Rogers, the demandant in the new action, was the eldest son of John Rogers, the second son of Mary Rogers. It will occur to any lawyer, however, that this title must have been good for nothing, inasmuch as Peter had never put in any claim, as he should have done; but, strange to say, it appeared on investigation that the long-lived tenant-in-tail had been, during the seventy-five years of his existence, *non compos*, and, therefore, his right remained in abeyance, and was revived (in his nephew) at his death in 1854, who, under the Massachusetts statutes, had ten years to bring an action. In one more year the title would have been destroyed by lapse of time, but in 1863 the vigilant John Rogers brought it, and it was prosecuted to a judgment in 1865, and so, after the lapse of half a century and more, the land reverted to the rightful heir.

—The case naturally attracted a good deal of attention, and particularly that of a young lawyer, to whom it occurred that, as the Ingalls title had proved good for nothing, and the Jones title no better, it might be worth while even to examine the Rogers title, and so he, too, began to look it up, with such success as to find that, in 1710, one Benjamin Parsons had conveyed the premises to one Hosea Johnson (from whom Buttolph had purchased it). The deed from Parsons to Johnson, it was found, conveyed the land without the use of the word "heir," and Johnson, under this deed, took only a life-estate in the premises, and at his death they reverted to Parsons and his heirs. It was also found that Johnson lived to the age of ninety-seven, and that at his death, in 1786, the sole heir of Parsons entitled to the reversion was a young woman, his grand-daughter, aged eighteen, and just married. She lived till 1861, and, having been all that time a married woman, could not have set up her title. At her death, her heirs had ten years within which to set up the title, and, by arrangements of a speculative nature, the heirs, who were three or four persons of small means scattered over the United States, were induced to "come to the front" and bring an action in 1869 (within two years their title, too, would have been extinct) for the recovery of the land. They recovered it, but immediately conveyed it (now worth two hundred thousand dollars) to one John Smith, who was popularly supposed to have furnished the sinews of war for the contest. During all this time it must not be inferred that Mr. William Ingalls was idle, for he too began to feel an interest in the old records, and resolved to trace the title back to its source in the "Book of Possessions"—the Massachusetts Doomsday Book. In this book, strange as it may appear, he found that the land had, about 1644, belonged to one "Madid Engle," or "Mauditt Engles," who, in 1650, conveyed it on an express condition that no building should ever be erected on a certain part of it. Down to the year 1872 this condition had never been violated; but after the fire of that year the reckless Smith had, in rebuilding, covered the forbidden ground. Presto! the Smith title disappeared, and on familiar principles of law the right of ownership reverted to the heirs of the original "Engle" or "Engles," if they could be found. It is hardly necessary to say that they were found, and they were no other than Mr. William "Engle," "Engles," or "Ingalls" himself; and after all these startling changes the property is now again in his hands. It ought, however, to be added to this strange tale that not a word of it is true, that the events are all fictitious, and have been put together by an ingenious Boston conveyancer for the purpose of showing what curious things might happen. The tale has deceived a great many people in and around Boston, and there have been many enquiries as to who the Ingallses are. The *Tribune*, too, seems to have been taken in by it.

—The cause of sound finance, and, indeed, of sound political economy in all departments, has suffered a heavy loss in the death of Mr. Amasa Walker. He was the author of only one book, the 'Science of Wealth,' which is better known and has been more widely read than any native work in the same field, though it owes, perhaps we might say, a great part of its value to the author's practical familiarity with the operations of trade and commerce, an advantage which he shared with Ricardo, and Bagehot, and Goschen, but which was, owing to the greater narrowness of his education and of his range of observation, less useful to him than to these writers. He was also an active contributor to periodical literature, and the usefulness of his discussions of financial questions of late years through this medium can hardly be overrated, though his want of regular mental training showed itself very markedly both in a defective sense of proportion and in an exuberance of rhetoric singularly unsuited to the treatment of questions even partially scientific. He was also for some years a professor of political economy in Oberlin College, and more recently a lecturer at Amherst, and, we believe, achieved considerable success as a teacher. As an economic writer, he may be said to stand in the second order; the *World's* estimate, which places him next after Mill and Cairnes among the economists of our own time, must be ascribed to the partiality of warm personal friendship.

—By the death of Mr. Thomas A. Jenckes the country has lost the services of a politician who some years since promised to do a good deal to lift the art of government from the slough into which it had fallen at Washington. A man of strong understanding and legal training, he was one of the few members of Congress who perceived at the close of the war that a new class of questions must necessarily take the place of those which had been brought into prominence by the long anti-slavery struggle, and he was ready not only to admit this, but practically to apply himself to their solution. The break-down of civil-service reform in General Grant's second term deprived him of a good deal of the credit which he would have justly earned had the promises of the Administration been kept, and, like many other civil-service reformers, he got, no doubt, by its failure the reputation of being an "unpractical" man. He had, however, as his comprehensive manner of dealing with the bankruptcy question showed, and, as we believe, all who had any acquaintance with him as a lawyer found, a practical intellect, and if he did not succeed as he might have done, it was due to other causes than this.

—Mr. William T. Blodgett has been for so many years the earnest promoter of art in this city that his death, which occurred last week at the early age of fifty two, would be a serious loss even if he had not been in all ways one of the most public-spirited citizens New York has ever had. He came comparatively early in life into command of a large income derived from a flourishing business, which we believe he had himself been mainly instrumental in building up, and he thenceforward used it without stint for the public welfare. He had already become slightly known at the outbreak of the war as a purchaser of pictures, and the ever-helpful friend both of artistic merit and misfortune, and during the war there was probably nobody here who gave both time and money more liberally to the support of the national cause. He served on all sorts of committees, responded freely to all demands on his purse, was an active diffuser of publications intended to influence public opinion both here and in Europe. Indeed, during all that trying period, when there was either work to be done or money to be raised he was one of the first men people thought of, and we may add that his private charity and benevolence equalled if they did not surpass in volume

what was seen and known. The first picture of note of which he became possessor was Church's "Heart of the Andes." He subsequently created a collection which is now estimated as worth probably $200,000, and includes some of the best works of living artists on both sides of the Atlantic. As a picture-buyer, Mr. Blodgett possessed a rare combination of qualities, and he had so much public spirit and so sympathetic a disposition that each new purchase was a public acquisition. To a passion for the subject, he added a genius for taking advice. He knew by instinct when he had got at the best authority, and a word or a hint was enough for him. He knew how to employ the best experts and get their best services. His admirable specimens of the modern French school are well known: his Décamps, Gérômes, Coutures, Meissoniers, Jules Duprès, Troyons, his Constable, and many others. His later purchases, some sixty or seventy in number (the greater part still remaining in Paris), included a beautiful Gainsborough (his own portrait), an equally excellent portrait of a lady by Reynolds, a first-rate landscape by Rousseau, an admirable small Cuyp, a small but very valuable picture by Van der Heyden and Adrian Van de Velde, a landscape and an oil sketch by J. Ruysdael, a Vandyke, a Claude, Peter de Hooghe, and many other pictures of great interest. Picture-buying with Mr. Blodgett was art-culture. He learned as he bought, and he weeded as he learned. The result is a collection the dispersion of which would be a public misfortune. Every year gives us examples of wealthy men leaving or giving large sums for public uses—a University in Baltimore, an Observatory in California, a Conservatory of Music in New York. If it could enter the heart of some such public-spirited man to conceive our poverty in America in respect of art, and the benefaction these pictures would be in such a place as our Metropolitan Museum, he might be sure no better use could be made of the money, should there be, at any time hereafter, an opportunity for the purchase of the collection as a whole. The Museum is largely indebted to Mr. Blodgett for its existence, and he may be said to have laid the foundation of its artistic value by purchasing at his own risk in Europe, for $100,000, the Dutch and Belgian Collection which furnished its first claim on public attention. Indeed, it would be difficult to name any undertaking of the last fifteen years for the cultivation of the public taste, or the promotion of the public welfare, in which he was not one of the foremost and most cheerful workers. We may perhaps be excused for mentioning among the reasons why we, at least, should hold him in grateful remembrance the fact that he was one of the original founders of the *Nation*, and took to the last a warm interest in its success.

—The recent death of the French artist, Carpeaux, reminds us to query whether there ought to be such a thing as an eminence in "unsculptural" or "tasteless" sculpture. Carpeaux, coming to Paris as a boy from Valenciennes in the full blast of the romantic war-cry, fed his fancy and taste with such works as Rude's "Chant du Départ" and monument to Cavaignac. At school he dreamed rather of Rubens and of Puget than of Phidias. In Italy, as *Prix de Rome*, he neglected the certified charms of the antique, and lounged about the streets until he incurred official censure; to justify himself he produced his sketch-book, crammed with attitudes picked up in the Ghetto and Trastevere—attitudes very different from the measured Greek ideal, but vivified with energies caught up straight from nature. He denied the accusation of idleness, saying that these were his *académies;* and, after a long delay and some rebuke, sent back to Paris his first work, one of the realistic figures which are now recognized as having the signet of his style. Carpeaux was from the beginning a Protestant in sculpture. If there can be no plastic art but that consecrated by the antique, he would have nothing to do with it. He believed that statuary may be conceived in other styles, and thought it no more just that sculpture should be restrained to the dignified school of the Greeks than that the other art of painting should be confined to the traditions of Pompeian frescoes and the figures on old vases; if painting, quite outside the limits of the antique mind, contained a place for Rembrandt and Ribera, why might not sculpture find corresponding privileges? From some such principles emanated "La Dance" on the New Opera-House, a group that engages the eye almost as a painting, with its heads cunningly pushed out from masses of shadow, its whirl of Corybantic rage, and entanglements of flesh wrinkled and pitted with exertion. Whether good or bad, it has the effect of making the three corresponding groups—by Perraud, Jouffroy, and Dumont—seem to have been made by one man, while itself stands out in a singular and effective isolation. The left-handed compliment it received of a coat of ink showed curiously how its revelations of textural possibilities in flesh-carving, though quite without voluptuousness, struck the crowd as a sort of indecency. All of Carpeaux's works are thus more or less undignified, illustration-like, sincere, and reeking with the sap of life and nature; the connoisseur feels that if this be bad sculpture, then from bad sculpture is a prodigious deal to be learned. Carpeaux looked upon plastic art, or rather his own line in it, as a work of decoration, and cherished the hobby that drapery was bad and almost inadmissible in composition. He made the group for the new fountain in front of the Observatory, representing the four quarters of the world sustaining a sphere; the admired and blameless decoration of the Pavilion of Flora in the Tuileries, showing Imperial France protecting science and tillage and enlightening the globe; the Dantean group of Ugolino, set up in bronze in the Tuileries garden, and exhibited in 1867 in Saint-Béat marble; the girl listening to a shell, with its goblin-like expression; the "Laughing Girl," the "Neapolitan Fisher," etc. Almost every salon contained a few of his famous portrait busts, with their vivid painting-like originality, their singular devices for expressing the quality of hair, the color and shadow of the eye, the accidents of the toilet, and the round-shouldered, unconventional poses which became with him a conventionality. That of Gérôme, exhibited in 1872, is repeated in casts at cost-price for the benefit of the scholars in the Atelier-Gérôme, and almost every pupil owns a copy. The portrait of the Prince Imperial was modelled in 1866, and shown in marble at the Grand Exposition. Carpeaux was, unfortunately, something of a courtier, and married a lady of the palace, whose conduct drove him to excesses which precipitated his death at the age of forty-eight.

—Among the anomalies of existing legislation there are few more antiquated than are found on p. 285 of the Revision of U. S. Statutes, 1873–4, title xvi., section 1625–3. From this it appears that it is now the law of the land that every able-bodied male citizen between the ages of eighteen and forty-five shall be enrolled in the militia, and that he "shall, after notice of his enrolment, be constantly provided with a good musket or firelock of a bore sufficient for balls of the eighteenth part of a pound, a sufficient bayonet or belt, *two spare flints* (!), and a knapsack, a pouch with a box therein to contain not less than twenty-four cartridges suited to the bore of his musket or firelock, each cartridge to contain a proper quantity of powder and ball; or with a good rifle, knapsack, shot-pouch, and powder-horn, twenty balls suited to the bore of his rifle, and a quarter of a pound of powder. . . . Each commissioned officer shall be armed with sword or hanger and spontoon." We are afraid that if each commissioned officer had to pass a competitive examination on the meaning of the word "spontoon," many of them would fail of their promotion. The spontoon is a sort of half-pike carried by the inferior officers of infantry. Possibly in Boston there is a nearer approach to this national militia, armed cap-à-pie, than in any other city in the Union. We venture to think so on the authority of the younger Ampère, who, when visiting this country in 1851, was much struck with the variety of uniforms in a civic procession celebrating the completion of the Grand Trunk Railroad. This led him (see the *Revue des Deux Mondes*, January 15, 1853) into some generalizations on the American fondness for the military art, which he thought greater than the English:

"I have seen children drilling and manœuvring for their amusement, like so many Paris *gamins*. The Mexican war fostered this warlike tendency. The Americans are getting accustomed to military presidents, and in this lies perhaps the germ of a great change in their character and institutions. Theoretically, everybody forms part of the militia; but there are volunteer militiamen enough, organized for drill in companies and regiments, to prevent the same thing being required of the other citizens. Still, in Boston at least, everybody, without exception, is obliged to have arms, and twice a year is called upon to show that he is completely equipped."

—*Nature* for October 7 has two articles which make points of a critical character. One is in a review, by Jevons, of the 'Positive Philosophy of Auguste Comte,' based on the new edition of Miss Martineau's translation, from which we cull the following:

"What sufficiently condemns Comte's laws of evolution is that they led him away from the doctrines of evolution as now established by Darwin and Spencer, and their followers. Comte was well acquainted with Lamarck's views, which he discusses in Book V., chap. iii., coming to the unfortunate conclusion that in every view Lamarck's conception is to be condemned, and 'that species remain essentially fixed through all exterior variations compatible with their existence.' . . . It is highly remarkable that, though the germs of the new philosophy of evolution had been put afloat by the elder Darwin, Lamarck, Malthus, and others, both Comte and his admirer, John Stuart Mill, entirely failed to appreciate their value."

As to Comte's contributions to social science, Jevons goes to the length of denying "that he had any true conception of the proper way of going about the work. It is impossible that he should have, because he altogether abjured and ridiculed that branch of mathematical science—namely, the theory of Probability—by which alone we can approach the scientific investigation of the complex condition of a nation. . . . The more exact and perfect, in fact, a science becomes, the more complete is the application of the rules derived from the theory of probability."

The able paper on Instinct and Acquisition, by D. A. Spalding, detailing some observations and experiments upon new-born pigs and new-hatched chicks and swallows, was read at the last meeting of the British Association. We have only space to cite the following from his closing remarks:

"The presumption, then, that the progress of the infant is but the unfolding of inherited powers remains as strong as ever. With wings there comes to the bird the power to use them; and why should we believe that because the human infant is born without teeth it should, when they do make their appearance, have to discover their use by a series of happy accidents? One word as to the origin of instincts. In common with other evolutionists, I have argued that instinct in the present generation may be regarded as the product of the accumulated experience of past generations. More peculiar to myself, and giving a special meaning to the word experience, is the view that the question of the origin of the most mysterious instincts is not more difficult than or different from, but is the same with, the problem of the origin of the physical structure of the creatures. For, however they may have come by their bodily organization, it, in my opinion, carries with it a corresponding mental nature. . . . It is not the doctrine of evolution that the bodies are evolved first by one set of causes and the minds are put in afterwards by another. This notion is but the still-lingering shadow of the individual-experience psychology."

—On the little map of Africa prepared by Prof. H. Kiepert, which appeared last year in the second pamphlet of the "Beiträge zur Entdeckungsgeschichte Afrika's" (Berlin: Reimer), and showed in colors the share of various nations in opening up that country geographically, nothing is more suggestive than the arrows. These represent three expeditions—two English and one German—up to the immense white spot that depicts our knowledge of central Southern Africa, a spot, by the way, that could contain all the States east of the Mississippi, save perhaps Wisconsin and upper Michigan. Possessors of this map, who have already erased the blue mark of the Young Expedition under Lieutenant Grandy (*i.e.*, the Congo Expedition for the relief of Livingstone), may now, we are sorry to say, do the same with the red mark of the German explorers. The leader of the principal (the Loango) expedition, Dr. Paul Güssfeldt, has returned to Europe. This work, our readers may remember, was undertaken by the German African Society, the creation of Prof. Bastian, which came into being in April, 1873. It was hoped to reach Central Africa by the Congo, whose importance had been made known by the discoveries reported by Stanley, and thus win fresh laurels for the new Empire by a united effort in that part of Africa which promised the richest reward to the explorer. Sufficient interest was aroused to enable the Society to fit out three expeditions, Dr. Güssfeldt having been sent in May of the same year. He was shipwrecked on the way out, and lost most of his equipment. Prof. Bastian followed him, to aid in the selection of a suitable station, a work for which his previous visit in 1857 admirably fitted him. Chinchoxo was fixed upon as a central station, and Bastian returned to Europe in October. He afterwards published a book containing his experiences and a not very popular account of our knowledge of Western Africa, and of what we might hope from the new explorers. There have been two subordinate expeditions: that under Dr. O. Lenz, who was sent to the Ogove, and reached Orisco Bay in June of last year; the other being under Major von Homeyer, in Angola. The reports from these workers have never been very definite, though excellent results may be anticipated from their investigations as specialists, the one being a geologist and the other an industrious ornithologist. The news from Chinchoxo has usually been merely hopeful, though of course we mean this in regard to advance into Africa.

—Within a few weeks Dr. Güssfeldt has returned to Berlin, and on the 3d of October he made his official report. The North-German *Allgemeine Zeitung* complains bitterly that the Society, which exists by popular contributions, did not permit this meeting to be reported. The real report, which will appear in the Society's *Correspondenzblatt*, can hardly be published in less than a month, and the quasi report in the Berlin *Post* tells actually nothing at all. On the 9th, he gave a popular account of his work at the meeting of the Berlin Geographical Society, but added wonderfully little to what was already known of his movements, except that he defined somewhat more fully the causes of his failure. Curiously enough, the very difficulties so graphically rehearsed by Dr. Behm in the first number of Petermann's *Mittheilungen* for the current year, have proved insuperable. Apart from the great delay occasioned by the loss of instruments at the start, trouble with carriers seems to have been the real stumbling-block. The native of that region is a poor carrier, and has a tradition that cannibalism flourishes at no great distance inland. The political importance of the innumerable petty potentates has been a most serious impediment, requiring to be overcome almost daily. Just these causes made Lieutenant Grandy's expedition really a failure, though he finally returned because informed that Livingstone had passed beyond all need of relief; and in commenting on this expedition, in his opening address before the Royal Geographical Society, Sir Henry Rawlinson said almost a year ago that the German expedition would probably be turned back by the same obstacles. Petermann's proposal to make use of elephants may prove worthy of consideration now. It was, however, ill-health that finally forced Dr. Güssfeldt to return. It is easy to sum up the work of this exploration. The Loango coast has been somewhat thoroughly examined up to the Sette, and the European has penetrated a little way into the Jangela country along the Quillu, and a still less distance inland along the Chiloango. The collections are said to be valuable, and to have arrived in unusually good condition, and the leader declares he has made most excellent observations. He is by no means disheartened, and would like to make another attempt under more favorable auspices. It has probably been decided to give up the Chinchoxo station, and to recall all who cannot be useful in the lesser expeditions. The leader of one of these, Major von Homeyer, has also been forced to return on account of the climate, though his party, we believe, is expected to continue the explorations with St. Paul de Loando as their station. They were some 250 miles inland when broken health compelled their chief to turn back.

## MEMOIRS OF J. Q ADAMS—VOLS. VI.–VII.*

THE sixth volume of the 'Memoirs of John Quincy Adams' begins with the story of intrigues for offices very like those of our own day, though upon a larger scale. General Parker, a familiar name then in official circles, but which has already dropped out of history, tells in full the story of his own battering from pillar to post:

"Both the President and the Secretary of War have reasons for disliking and, as he evidently thinks, for dreading Parker, and the very day that he was worried out of office by the nomination of Towson to his place, Crawford wrote him a note (6th May), unsolicited on his part, offering him a clerkship of a thousand dollars' salary in the Treasury Department, which he declined. He showed me this note of Crawford's, and said he understood its meaning. It was saying to him, This is all I have to give, and this is at your disposal. This avidity of Crawford to secure Parker in his interest is easily accounted for. He knows that great use may be made of him against both the President and Calhoun. Parker is deeply exasperated at the treatment he has received."

Crawford was no favorite of Mr. Adams, who was not a man to conceal his likes or his dislikes. Then, as now, Presidential contests awakened bitter feelings, and often brought out dangerous secrets. In 1814, the rival candidates were Monroe and Armstrong. Armstrong was Secretary of War, Monroe Secretary of State. But the military correspondence of the campaign of 1813, which belonged to the War Department, had passed into the State Department. There were things in it which were susceptible of interpretation unfavorable to the President:

"He (the President) desired Parker to inform the Secretary of State that he wished to see him the next morning. Parker accordingly called at Mr. Monroe's house, and left word there, he not being at home, that the President wished to see him. But Mr. Monroe, early the next morning, left the city and went to Loudoun, whence he did not return for several days. Mr. Madison then went himself to the Department of State, and, directing all the papers of the military correspondence to be brought to him, ordered the whole of them to be sent over to the War Department. He was more in a passion than Parker ever saw him at any other period of his life, and gave it very distinctly to be understood that he thought that Mr. Monroe had been meddling with the affairs of the War Department more than was proper."

A violent attack had been made by Armstrong upon Monroe in the *Philosophical and Literary Repository*. Parker had in his possession papers which "would show the full and detailed state of the case," and these it was that Mr. Madison was so anxious to get possession of.

Calhoun comes on the stage, and as an eager and not very trustful intriguer:

"He was very sanguine in his expectations of succeeding to the Presidency, and believed he had a majority of Congress in his favor. And among the rest of his converts was General Scott, who was now gone to Richmond to ascertain whether by resigning his commission in the army he could obtain an immediate election to the Legislature of Virginia, and then into the next Congress. He was in that case to be one of Mr. Calhoun's champions. And he was the author of a paper in the *National Intelligencer* attacking the majority of the Senate for their proceedings in the case of the rejected nominations.

"I said, I believe, that Mr. Calhoun was too sanguine in his calculations of success as a candidate for the next Presidency. There were in Congress three parties—one for Mr. Crawford, one for Mr. Clay, and one for Mr. Calhoun. They embraced almost the whole; but the party for Mr. Crawford was the strongest, and the party for Mr. Calhoun the weakest of

* Memoirs of John Quincy Adams. Edited by Charles Francis Adams. Vols. VI.–VII. Philadelphia: J. B. Lippincott & Co.

the three. And I had little doubt that the parties of Crawford and Clay would finally coalesce together."

Calhoun reappears very often, and always with the air and tone of an intriguer. In those days, as in our own, the Presidency cast long shadows before it. Mr. Adams foresaw a change in the Cabinet. Calhoun would probably be compelled to go out. "Very probably," he adds, "the case may be my own; for the attacks on me at the late session of Congress had been from masked batteries, but they had been of the most deadly character, and as they imputed to me as a crime that which I believed to be the greatest service I had rendered my country, I could not possibly foresee what the next charge against me would be. All I knew was that it became me to be prepared for my political decease at a moment's warning." There was no affectation in this. It was the calm prevision of a wise man. Parker related to him an instance of the President's friendly feeling towards him, and "thought I might, therefore, rely upon the support of the President; but I told him I must rely upon my own support or not at all." Here, again, we have the key-note of Mr. Adams's career—self-dependence, self-support.

Among the most interesting pages of this volume are the abstracts of the Cabinet meetings. Mr. Adams never appears to more advantage than in the discussion of questions of international law and general statesmanship. Thoroughly grounded in principles, his reading and experience supplied him with abundant illustrations. He possessed also the rare faculty of just application. Next to these are his minutes of his interviews with foreign ministers. We give passages taken almost at random. In one of what he calls Mr. Canning's "long two or three hours' visits," the British Minister tried to draw from him what was still a Cabinet secret. "But I did not think proper to gratify his curiosity," wrote Mr. Adams. Mr. Canning hinted that there were dissensions in the Administration upon the question of the right of search. "I assured him that he was mistaken," writes Mr. Adams, "as there was no diversity of opinion in the Administration concerning it. He hinted that some or one of them had spoken otherwise of it to himself—which is not impossible; but I told him, if they had, it was only by the complaisance of conversation, avoiding to come to a direct issue of opinion." Was ever a diplomatic thrust more diplomatically parried? The question of internal improvements comes up in the course of a conversation with General Scott. "He avowed his concurrence with the opinion of the President, that Congress had the power of appropriating money to make the roads, but not to make them, which, I told him, was saying that they had the right to use the means, but not to enjoy the end. I asked him also several questions, till he said he did not like the Socratic mode of reasoning." The statesman had evidently driven the soldier to the wall.

Among the subjects which had almost an hereditary claim upon Mr. Adams's attention was the question of the fisheries. "This subject of the fisheries," he writes on the 19th of June, 1822, "is absorbing so much of my attention that it encroaches upon my other necessary occupations. But I cannot give too deep attention to it. 'What in me is dark, illumine; what is low, raise and support.'" The question of sending ministers to the South American Republics was discussed in Cabinet meeting. "Mutual advantage and reciprocity are all that we ought to ask, and all that we can be willing to grant. As to running a race with England to snatch from these new nations some special privilege or monopoly, I thought it neither a wise nor an honest policy." A doubt was started as to the President's power to appoint a Minister during a recess of the Senate. He said: "The *words* of the Constitution are against the exercise of the power; the *reason* of the words is in its favor." He was for offering the mission to Colombia to Mr. Clay:

"I thought it doubtful whether he would accept it—very probable that he would make no delicate or generous use of it—and that the comments upon the offer, both of his partisans and others, would be various and in many cases invidious. But upon the whole the effect upon the public would be favorable. He wanted the offer. The Western country wished it might be made to him. His talents were eminent; his claims for public service considerable. The republic of Colombia, and particularly Bolivar, with whom he had been in correspondence, will be flattered by his appointment, or even by information that he had the offer of it. In the relations to be established between us and that republic, Mr. Clay's talents might be highly useful, and I did not apprehend any danger from them.

"The President appeared to be well disposed to take this course. He said that Mr. Clay's conduct towards him and his Administration had not been friendly or generous, but he was disposed entirely to overlook that. He stood upon ground quite independent of Mr. Clay, and as he had never needed his support, he had never felt the want of it. He would consider of the proposal to offer him the mission, and was not indisposed to it.

"As to myself, Clay's conduct has been always hostile to me, and generally insidious. From the time of the Ghent negotiation I have been in the way of his ambition, and by himself and his subordinates he has done all in his power to put me out of it. In pursuing a generous policy towards him, as an enemy and a rival, I do some violence to my inclination, and shall be none the better treated by him; but I look to personal considerations only to discard them, and regard only the public interests."

Time brought a change in the feelings of these two eminent statesmen towards each other, and no one wept more sincerely over the death-bed of John Quincy Adams than Henry Clay. A great deal was said during Jackson's Administration of back-stair influence. Mr. Adams gives an instance of it under Mr. Monroe, and calls it undertowing. The occasion was a new Convention with France:

"I received a note from the President," he writes on the 22d of June, "directing me, after my letter to the French Minister about Stockton's seizures should be written, to see the Baron and show it to him, so as to arrange the matter to his satisfaction, to avoid a correspondence which might delay the conclusion of the Convention. Now, this was undertow through Crawford or through Thompson, the Secretary of the Navy. De Neuville has worked through this negotiation chiefly through such means. He has wormed out of us a Convention which will give great dissatisfaction here, and far less favorable to us than I could have obtained but for this countermining. Crawford has all along hung like a dead weight upon the negotiations. A bad Convention was precisely the thing suited to his interest—a good one would have been highly creditable to the Department of State. He has invariably been for conceding everything, for agreeing to everything demanded by France; and now he is for making humiliating concessions upon the complaint against Stockton. Thompson has not the same motives, but there is a Secretary of the French Legation intimate in his family, and that gives access to the President through another whispering-gallery. Such is the way of the world—winding stairs in every direction! I am sure the President has been beset by a back door from this note. It came too late, however. My letter to the Baron was already despatched, of which I am glad; for it is perfectly obvious that after writing him a letter quite sufficiently apologetic, to send for him, show it to him, and ask him if that was enough, would be no other than an invitation to him to insist upon more."

The slave-trade comes up in an interview with Mr. Canning, who, "with some circumlocution, came finally to the statement that he expected a new proposition from us" concerning the trial by mixed courts.

"This," writes Mr. Adams, "had so much the appearance of a trick that it heated me. I said to him, 'Mr. Canning, there is nothing I like so well as a straightforward course. We have seen no cause to change our opinions upon any of the points that have been so fully discussed between us. We have no new proposition therefore to make. . . .' I told him they had no right to carry away private property or to emancipate slaves. He said banteringly that if we were at war he would emancipate every slave he could find. 'Then,' said I, 'I would never make peace with you till you had paid for them. But who are you to talk of emancipating slaves?' He said they had none. 'And what are your West India Islands? What would you say if we should land in Jamaica and emancipate your slaves?' 'Aye, but,' said he, 'we do not mean to let you land in Jamaica.' 'Not if you can help it,' said I. 'Do no right and take no wrong, I have heard was the English sailor's motto.'"

We give one more specimen of Mr. Adams's feelings towards Mr. Clay at this epoch. It relates to one of the bitterest and, at the same time, the most triumphant of all his controversies—the controversy with Jonathan Russell:

"I received from Boston," he writes on the 1st of July, "Jonathan Russell's reply to my remarks upon his letters communicated to Congress. It is published in the *American Statesman*, a newspaper printed at Boston, of which Henry Orne is the editor. The paper is of the 27th of June. Orne is a young lawyer of some talents, and a political adventurer of whom Mr. H. King has made a partisan for Crawford for the succession to the Presidency. Russell's reply is as full of falsehoods and misrepresentations as his letter from Paris. He admits the interpolations in his duplicate. He attempts to represent me as having tricked him into the delivery of his letter at the Department as a duplicate; and, having no sort of regard to truth, he has made up a plausible tale of new accusation against me, to which I must again reply. It is a great mortification to me to have a large portion of the time which ought to be devoted to the discharge of my public duties absorbed in necessary self-defence. This is a miserable plot against me, devised by Clay at Ghent, and in which he has made a tool of Russell. Clay and Russell are the eagle and the worm of Herder's fable—Clay soars and Russell crawls to the top of the mountain. I began upon a rejoinder to Russell's paper this evening."

This was a fatal controversy for Russell, whose name disappears from history, and whose life ended in humiliation. Schoolboys remembered him for a while as a Fourth-of-July orator. But—"Dies traditur die"—even the generations of schoolboys have forgotten him. Mr. Adams's triumph was complete.

His relations with Calhoun were a little less disagreeable:

"The relations in which I now stand with Calhoun are delicate and difficult," he writes on the 8th of July. "At the last session of Congress he suffered a few members of Congress, with an Irishman named Rogers, editor of a newspaper at Easton, Pennsylvania, at their head, to set him up as a candidate for the succession to the Presidency. From that moment the caballing in Congress, in the State Legislatures,

in the newspapers, and among the people against me, has been multiplied tenfold. The *Franklin Gazette* of Philadelphia, under the direction of R. Bache, G. M. Dallas, T. Sergeant, and Ingham, in concert with Rogers, opened immediately upon me, and has kept up ever since an insidious fire against me. Calhoun's partisans have countenanced it, and have been as busy as those of Mr. Crawford in their efforts to degrade me in the public opinion. Meanwhile, Calhoun has always professed to be a friend and admirer of mine, and to persons whom he knows to be my friends has said that he did not intend to be a candidate against a Northern man, and that he himself was decidedly for a Northern President. There was a time during the last session of Congress when so large a proportion of numbers was enlisted for Calhoun that they had it in contemplation to hold a caucus formally to declare him a candidate. But this prospect of success roused all Crawford's and Clay's partisans against him. The administration of his Department was scrutinized with severity, sharpened by personal animosity and factious malice. Some abuses were discovered and exposed with aggravations. Cavils were made against measures in the execution of the laws, and brought the President in collision with both Houses of Congress. Crawford's newspapers commenced and have kept up a course of the most violent abuse and ribaldry against him, and his projected nomination for the Presidency has met with scarcely any countenance throughout the Union. The principal effect of it has been to bring out Crawford's strength, and thus to promote the interest of the very man whom he professes alone to oppose. Calhoun now feels his weakness, but is not cured of his ambition. My personal intercourse with him now is necessarily an intercourse of civility and not of confidence."

These bitternesses were not without their effect upon Mr. Adams himself. It is difficult to feel that you are the constant object of malicious invention and not feel impelled to retaliate. It is hard to have your purest actions misinterpreted, your purest motives perverted, and not resent the perversion. Mr. Adams did resent it, and felt his trust in human nature weaken as he read the offensive words.

The Cabinet meetings discuss the question of fugitive slaves and the acquisition of Cuba, and with the same pen with which he recorded these Mr. Adams discusses and translates the well-known verses of the dying Hadrian :

> "Dear fluttering, flattering little soul,
> Partner and inmate of this clay,
> Oh, whither art thou now to stroll?
> Pale, shiv'ring, naked little droll,
> Ne more thy wonted jokes to play!"

## TURGOT.*

IF Voltaire was the prophet, Turgot was the saint of the *philosophes*. He was the man who, in the words of Condorcet, "made the nearest approach to that perfection to which human nature can raise itself." He stood, that is to say, before his friends as the actual embodiment of all that was highest and truest in the conceptions of his age and school; he actually was "that virtuous citizen" whose virtues the men of the XVIIIth century were in general far more prone to eulogize than apt to imitate. Hence his very shortcomings are the defects of the philosophic and political sect to which Turgot belongs, and Condorcet's charming biography, containing, as has been well said, "one of the wisest and noblest of lives, delineated by one of the wisest and noblest of men," has a peculiar interest, as presenting not only the portrait of a noble original, but also a sketch of a philosophic and moral ideal. The partiality of friendship may have added here and there a touch which may make the Turgot of Condorcet a more perfect representation of human perfection, as conceived by the *philosophes*, than was the Turgot of real life; but there is no reason to suppose that the admiration of a friend and disciple has substantially overrated the virtues of the minister who, a century ago (1774–1776), gave France her last chance of averting revolution by reform. For, considerable as were Turgot's talents, moral elevation is the predominant characteristic of his genius.

Condorcet's biography is singularly destitute of personal anecdotes. The few that are given all bear witness to the same constant effort to act up to the requirements of a high moral ideal. In his boyhood, Turgot spent his pocket-money on gifts of books to his poorer schoolfellows. As a young man, he eschewed the priesthood, for which he was destined, through the fear of pledging himself to the maintenance of dogmas which he either did not or in future might not believe to be true. His choice of a career was regulated by reference to its opportunities of serving the public; and, when acting as an administrator, he compensated at his own expense an official for loss sustained through Turgot's legitimate delay in investigating a painful charge of misconduct. Even in his dealings with his friends and associates he displayed a high-toned regard for duty which sometimes might seem to verge on moral squeamishness. He sympathized with the efforts of the founders of the famous 'Encyclopædia,' but, though he wrote one or two articles for it, he declined to become permanently connected with the work, because of his firm conviction that all sectarianism and spirit of partisanship was, in the long run, a hindrance to the spread of truth. In these and in other traits may be seen something of that excessive conscientiousness or scrupulosity which is the weak side of men ruled by a desire to live in the complete performance of duty; but it is the glory both of Turgot and of his school that his conscience found its satisfaction not in mere efforts after individual perfection, but in untiring labor for the public good. The absence from Turgot's biography of those personal traits which lend such a charm to lives such as Johnson's, is characteristic both of Turgot and his admirers. Turgot lived, so to speak, in his principles. There are some men, like Johnson, whose whole greatness lies in their individuality. Take from Boswell's life all its racy traits of individual character and there would be nothing left worth record or attention. In the case of men of a different type, such as Turgot, their work and thoughts are of far more consequence than their personal characteristics. Condorcet's book might be deprived of every one of the few anecdotes which it preserves, but it still would contain a picture of the truest public spirit, guided by the philosophic enlightenment of the last century.

It is, in fact, in his zeal for the public good that Turgot most truly represents the best side of his generation. The very evils of the time—the accumulated mass of abuses, the selfishness of politicians, the disregard by men in power for the sufferings of the people, the corruption of the state, and the prejudices of the church—had, by the force of reaction, inspired the better minds of the age with a zeal for the public good of which it is hard to realize the intensity at a time when reforms are easy to effect and public spirit has become an almost forgotten virtue. No doubt there was some hollowness in the theatric virtue of the past century, and the experience of the Revolution was scarcely needed to prove that "virtuous citizens" might often be a decent alias for unmitigated scoundrels. But Turgot's career is a standing protest against the delusion that the virtuous aspirations of the eighteenth century were, any more than the virtuous aspirations of other ages, either hypocritical or unmeaning. His letter to the king—which is perhaps the noblest address ever presented by a subject to a sovereign—might perhaps pass as a grand specimen of virtuous rhetoric. His labors as a minister might be ascribed to the legitimate ambition of a statesman coveting the fame of a public benefactor. His toils for eleven years as the "intendant" of a province are the truest criterion of his virtues. In every department of administration he struggled to free his province from the evils inflicted upon it by a long course of stupid and tyrannical misgovernment. He mitigated the pressure of the *corvée*. He reformed a system of conscription which was making French peasants abominate the military service. He mitigated the evils, which he had not the power to remove, flowing from a radically vicious system of taxation. He attempted both to vindicate and, as far as in him lay, to apply principles of free trade which even now are scarcely appreciated in any country by the mass of the people. He endeavored, in short, to rule one district of France at least in conformity with those maxims of enlightenment and common-sense which, had they been applied in time to the government of the country, might have saved the French nation from the disasters of the Revolution and, it may be, from the miseries of the present day. He further, while seeking the welfare of the people, was not afraid to meet popular outcry. The man who, in the eighteenth century, attempted to protect usurers from the penalties to which they were exposed by unjust laws, showed that his benevolence was of that sterling kind which dares to benefit the people by defying their prejudices.

Turgot's practical as well as theoretical defence of usury illustrates the noblest side of the *philosophes*. Their real glory was their firm belief in the power of enlightenment, knowledge, and science. The enthusiasm of Turgot and of the best of his associates was not grounded on a sentimental sympathy with popular sufferings; still less did it rest on the belief, which in one form or another is the constant illusion of modern democrats, that the voice of the people is in a sense the voice of God, and that popular sentiments or prejudices have in themselves a certain claim to intellectual respect. His enthusiasm and his benevolence were grounded not on sentiment of any kind but on a firm belief in the truth of a whole body of economical and political doctrine. The great amount of truth which, mixed with some error, was embodied in this belief is obscured from the present generation by the tendency, of which Condorcet's book affords numerous examples, to consider rules, many of them perfectly true in themselves, as laws of nature, and as such entitled to a sanctity beyond that attaching to every sound principle. It should, however, be noticed that with men such as Turgot this theoretical error led to fewer practical mis-

* 'Vie de M. Turgot.' Londres. 1786.

takes than might be anticipated by his modern critics. A sound rule of political economy is none the less true because it is erroneously called a law of nature, and Turgot, when, for example, attacking restrictions on usury, anticipated by some years the views of the utilitarian philosopher who gave its death-blow to the belief in the so-called law of nature. Ardent public spirit, combined with an intense belief in the power of enlightenment, naturally led Turgot to adopt that belief in the "perfect ability of human nature" which formed the central dogma of his school. This belief was his true religion. It kindled all his enthusiasm, and inspired him with the kind of devotion which many people hold can be inspired only by strictly religious or theological doctrines. When preparing for the priesthood, it fell to Turgot's lot to write two themes. The subject of the one was the utility of Christianity. The benefits which in his view Christianity had conferred on the human race were the preservation of the Latin language, the creation of the scholastic philosophy, and the formation of a system of universal morality. The subject of the second essay was the progress of the human intellect (*l'esprit humain*). In this theme he showed how scientific discovery had, step by step, promoted the progress of mankind. "He concludes with proving that the progress of the sciences, to which no limit can be placed, is a consequence of human perfectibility, which, in his belief, was unlimited. This opinion he never afterwards abandoned. It was one of the fundamental principles of his philosophy." It is easy to see which of the two essays embodied the religion of Turgot. The calm and singularly unappreciative criticism of Christianity by a man like Turgot, written when he was still studying for the priesthood, tells more of the sentiment of the time than all the sarcasms of Voltaire.

The crowning scene of Turgot's life was marked by that combination of moral triumph and external failure which gives the last touch of glory to characters that claim reverence for their enlightened virtue. As a minister, he accomplished or attempted all his friends could have expected from his patriotism and his philosophy. Within eighteen months, he abolished grievances, such as the *corvée*, under which the people labored. He began to introduce order where there had been confusion. He propounded a policy of economy and reform, the leading maxims of which were "no bankruptcy," "no increase of taxation," "no loans," and proved that his policy was not the dream of an enthusiast, but the practicable scheme of a statesman. Surrounded by plotters, and undermined by mean intrigues, he yet exhibited that boldness in maintaining order in which French theorists have constantly been deficient. He stood forth before his generation, and has remained ever since in the memory of posterity, as the last French statesman who has sinned neither by violence nor by weakness, and who knew how to combine zeal for reform with the maintenance of order. Having shown what he might have done for his country, he was dismissed from power by the very king who acknowledged his virtues. "Only I and Turgot love the people." The *mot* had scarcely been uttered when the king showed his own love for the people by dismissing Turgot. It is more than possible that the weakness of Louis would have prevented the vigor even of Richelieu from saving the doomed monarchy. But the failure of Turgot arose, like every failure, from faults or errors which are the more instructive because they exhibit the weak side of a school rather than of a man.

Two of these causes are especially noteworthy. The French *philosophes* believed in the force of enlightenment. This belief, noble as it is, was connected with the ungrounded conviction that the truths which approve themselves to men of sense and reflection will, when once they are set forth, dispel as of their own force the delusions of prejudice, ignorance, and self-interest. A crucial instance of the fallacy of this view is found in the slow spread of the doctrines of free trade. The free-traders' arguments were at least as clearly apprehended by Turgot and Condorcet as by Bright or Cobden. A century has passed, and the leading statesmen of France are still deluded by the errors of protection. Add to this the firm belief, not only that the principles of justice and humanity could be applied to all nations alike, but that philosophy had discovered a body of laws equally adapted to every people, and you have found half the source of Turgot's failure. His strength lay precisely in that point in which Burke, even in theory, was weak—that is, in the appreciation of the economical principles which may, in a sense, be called immutable. His weakness was to be found in the failure to perceive the difference between the changeable rules of politics and the unchangeable rules of economic science which Burke perceived more keenly than any other political theorist. The ill effect of these speculative errors was intensified by the fact that Turgot, uncertain of his tenure of power, and influenced by the traditions of French administration, hurried on his reforms with the haste of a revolutionist or a despot. "You forget," he replied to the remonstrances of a friend, "how great are the wants of the people, and that I belong to a family who die of the gout at fifty."

The hasty introduction of wise reforms might not have been fatal to Turgot's power if there had been behind him any force to resist the opposition which his reforms were certain to arouse. The second and immediate cause of his failure was the want of any support but the uncertain goodwill of the sovereign. Here, again, his error was that of his school. They based their hopes of reform rather on the enlightenment of the governing powers than on the efforts of the people. The experience of the century which preceded the Revolution lent more countenance than modern liberals are disposed to admit to the view that the enlightenment of a monarch is more likely to remove abuses than is the ill-regulated and uncertain force of popular emotion. Condorcet, writing on the very eve of the Revolution, still clings to the theory that an absolute monarch might be the truest support of an enlightened government; and Turgot saw the weak side of national patriotism and of the desire for political liberty with greater clearness than he perceived the weakness of reforms depending simply on the will of a benevolent sovereign. That the sovereign might himself fail in enlightenment, that the force of adverse interests must be overcome by the exertions of the people on their own behalf, are truths palpable enough not only to statesmen but even to theorists accustomed to the political life of a free country. Turgot failed to perceive the immense force of "sinister interests" which Bentham had constantly before his mind. He had further, as already pointed out, an almost morbid dislike to the spirit of party. When he stood confronted by all the meanness, the unscrupulousness, and the cunning of men and classes whose petty interests were opposed to the welfare of the nation, he had not the support either of the people or even of a party upon which to fall back. The king, on whom alone he relied, failed rather than betrayed him, and he fell a warning of the weakness of ministers or sects who put their trust in princes. But if Turgot fell as a statesman, his greatness as a man became the more conspicuous from his fall. He retired to the studies and speculations to which he was devoted, and in his wide interest in the general welfare of mankind, which extended its scope as his power of influencing the government of France diminished, remained at the end, as he had been from the beginning of his life, a representative of the noblest sentiments of his age.

## THE ABODE OF SNOW.*

THIS extremely interesting volume is composed of a series of articles which originally appeared in *Blackwood's Magazine*, where they attracted some attention. Mr. Wilson has lately republished his articles, with some additions and alterations, but the volume before us (the American edition) is, as the publishers state with a frankness not always practised, reprinted directly from the magazine. The absence of the amplifications contained in the English edition will, however, perhaps not spoil it for the general reader. If 'The Abode of Snow' has a fault, it is rather too long. It makes a stout volume in the form which Messrs. Putnam have given it, and though it is not a book in which one is more than just tempted to skip, a little extra matter might make one succumb to the temptation. Mr. Wilson has added another volume to that record of what may be called heroic travel to which Englishmen have of late years contributed so largely. One by one, all the difficult things in the world are being done—every conceivable combination of the apparently impossible has been attacked and mastered. Mr. Wilson has done the Himáliya (we adopt his orthography). He desired to go from Simla—the great Indian watering-place—to the Vale of Kashmir, as well as to take a dip into Transhimáliyan regions (Chinese Tibet) on the way. There are comparatively easy and commonplace routes which Mr. Wilson might have taken, but they would have kept him at a low altitude on the mountains, and his health (for which his journey was undertaken) appears to have demanded, and to have flourished in, the atmosphere of the highest places in which human life can be sustained. His project, therefore, was to keep perpetually above the region of the scorching monsoon and to make his way to Kashmir exclusively along the high levels—literally, almost from peak to peak. He crossed over first into Chinese Tibet, where he received, chiefly from the women and dogs, a very cold welcome, and was implacably checked at the frontier. His glimpse of the country, however, does not indicate that even a warm welcome would make it agreeable to advance very far. His brief sojourn at Shipki, the Tartar frontier town, where the natives, with faces unwashed from their birth, stood timing his stay, watch in hand, as it were, is one of the most curious episodes in his volume. He succeeded in his attempt to keep in the upper regions, though

* 'The Abode of Snow: Observations on a Tour from Chinese Tibet to the Indian Caucasus, etc. By Andrew Wilson.' New York: G. P. Putnam's Sons. 1875.

in the face of truly astounding difficulties. His course lay in general at an altitude of about 12,000 feet. He appears to have been a serious invalid at starting, and before his descent to Shipki he was, in addition to his usual infirmities, laid up for several weeks with dysentery at the house of a Moravian missionary. But his pluck and pertinacity accepted no permanent rebuffs. He travelled with various servants, and with a retinue of coolies (procured at successive stages) to transport his luggage and camping apparatus. He managed always to sleep in a tent, but the steady steepness of the Himáliya is such that it was often necessary to travel many miles before a level space large enough to pitch a tent could be found. Nominally, the Himáliya have certain roads, which figure in maps and surveys ; but in reality these roads are mere thread-paths, usually of the most breakneck description, climbing the face of interminable and more or less perpendicular slopes, and affording a mere foothold on the edge of precipices which are apparently to those of the Alps as the great Himáliya peak of twenty-nine thousand feet is to the fifteen thousand feet of Mont Blanc. Mr. Wilson, driving, stimulating, sustaining, compelling his reluctant servants and porters (who upon the snow-fields and among the precipices of course thought that, of all insane forms of English pleasure-seeking, this was the most insane), proceeded in any way and every way that presented itself. He was carried in a "dandy" (a peculiar and very primitive form of litter), he rode upon yaks (huge Tibetan oxen), upon zo-pos (cattle of the same family), and upon ponies and mules, and, when he could, he walked. He seems to have found it possible to ride in places where it would appear that to trust to a vicarious foothold must be but a fantastic aggravation of danger, though Himáliyan ponies, by his testimony, shrink from almost no feats that monkeys will accomplish. In especial, Mr. Wilson was familiar with the *jhúla*—a swinging bridge of twisted twigs, which offers the only means of passage across the Himáliyan rivers. These twigs are wound into three rough, bristling ropes, one lower than the others, and suspended from bank to bank of the stream, and the expectation is that the traveller will walk along the lower rope (which at best is of the loosest texture, and very apt to be rotten) with such assistance as he can extract from the others. The approved method seems to be to take the jhúla at a run, and somehow or other, with the energy of desperation, to find one's self at the other end. It offers the dangers of the slack-rope performance, without the applause and other compensations of the circus.

Mr. Wilson had a number of adventures of a sufficiently portentous kind. He slept upon snow-fields (it is interesting to know that his malady was rheumatism), with white Tibetan bears hovering in the neighborhood ; he came near being snowed up for the winter in a Tartar village ; he narrowly escaped perishing in a snow-storm on a pass 18,000 feet high. This last was the maximum of Mr. Wilson's climbing, but it was very well. In compensation for all this, he had the constant view of stupendously grand scenery. "An enormous semicircle," he says, on resuming his journey after his illness at the Moravian missionary's, "was visible of grand precipices, high mountain peaks, and snowy summits, over 20,000 feet high. Resting on the grass, looking on that beautiful yet awful scene—on the boundless wild of serrated ridges, rock-needles, mountain-battlements, storm-scathed precipices, silvery domes, icy peaks, and snowy spires—and breathing the pure, keen, exhilarating air, it almost seemed as if during my illness at Pú I had indeed passed from the torturing life of earth and had now alighted upon a more glorious world." Yet in spite of the enormous scale of the scenery of the Himáliya, it does not appear that in beauty of detail it can compare with that of the Alps. Mr. Wilson draws an extended parallel between the two ranges, in which, while allowing everything to the tremendous ruggedness and desolation of the Himáliya, he complains of their monotony and want of vegetation. That this latter deficiency should be observed upon mountains where such products as the apricot grow at 10,000 feet, and where cultivation is found at 13,000, gives one an idea of the huge scale of the Himáliya.

Mr. Wilson, pushing toward Kashmir, traversed the desolate and curious country of Zanskar, a Tibetan province, almost virgin soil to the traveller, and whose population presented to Mr. Wilson many striking analogies with the Scotch Highlanders. It was here that he was threatened with a premature descent of winter which would have compelled him to pass that season in a hut with a hole in the roof and another in the floor, in company with an old Tibetan grandame for ever mumbling the orthodox national prayer ("O God, the jewel in the lotus !") and two young children of the most "*terrible*" propensities. The Vale of Kashmir was all Mr. Wilson's fancy had painted it, and he makes it seem a very desirable pilgrimage to his reader. On leaving it he pushed still westward into the British Trans-Indus possessions and the border of pugnacious Afghanistan. He crossed over and hob-a-nobbed, for curiosity's sake, with some worthies who had just been striving to put a rival faction in their town to the sword, and all his observations of Afghan manners are extremely entertaining. From these neighborhoods he made his way south and east again across the Panjab (Mr. Wilson overturns all the familiar forms of Indian names) to Lahore and the railway Apropos of Indian names, they swarm in his pages to a bewildering degree. What is one to say to the Amir of Kaubool, the Akoond of Swat, or the Mullah of Topi ? We have been able to give but a very imperfect synopsis of Mr. Wilson's book, but we recommend it as a decidedly superior specimen of a class which, in these days of combined travelling and scribbling, sometimes exhibits rather forlorn recruits. It is extremely full, it deals with a multitude of points which we have not been able to mention, and it is always interesting. The author is evidently a man of large experience and of large and various ability, and he discusses all things—his personal adventures, Indian politics, the Tibetan religion, questions of ethnography—with excellent point and force.

---

*An Elementary Grammar*, with full Syllabary and Progressive Reading-Book, of the Assyrian Language, in the Cuneiform Type. By the Rev. A. H. Sayce, M.A. (London: Samuel Bagster & Sons ; New York : John Wiley & Son.)—A language may be supposed to be becoming a popular study when its students call for an elementary grammar, with exercises to be written out and suitable reading lessons. The Assyrian appears to be of late quite the rage, and furnishes more than half the matter for the transactions of the Society of Biblical Archæology, now the most enterprising of all the Oriental or antiquarian societies of England. It was for classes organized under the auspices of this Society that Mr. Sayce has prepared his new 'Elementary Grammar.' This is not the first general grammar of the language that has been published. Following Dr. Hincks's 'Specimen Chapters' and 'Assyrian Verbs,' we have had Oppert's compact 'Elements,' of which the first edition appeared in 1859 ; Menant's larger grammar, published in 1868 ; and Mr. Sayce's 'An Assyrian Grammar for Comparative Purposes,' published in 1872. Of these, only Menant's employed the Assyrian type, while the student who used the others was compelled to depend on separate volumes for his alphabet, or rather syllabary, the most troublesome factor for the student who would solve the cuneiform problem. For the English beginner this second grammar of Mr. Sayce will be in every part useful. To the more advanced student, it will be of extreme value for its excellent syllabary, the most complete and useful yet published. The characters are arranged, as they ought to be, in the arbitrary order of the direction of the component wedges. In this the author follows Norris, Smith, and De Chossat, making it possible for a student to find a character, a feat hardly to be achieved by one who depends on the two large volumes of Menant's 'Syllabaire Assyrien,' which arranges some thousands of various characters, graphic and dialectic, in the order of the twenty-two Hebrew letters.

It is some tribute to the ancient grammarians of Nineveh that Mr. Sayce has scarcely done more than copy the syllabaries as found on the clay tablets of Assurbanipal's library. On one side of his column of characters he marshals their phonetic and Accadian value, while on the other he gives their Assyrian rendering, and in a fourth column their English meaning. Even the double comma put under a character to show that it has also the significations in the next lines, is as exact a representation as our types will allow of the cuneiform sign for *ditto*, used for precisely the same purpose in the syllabaries of the British Museum. More than a third of the volume is taken up with this syllabary, which contains 522 characters, exclusive of mere variants. Smith gives 380, and De Chossat 1,214, but the graphical variations are such that little can be gathered from this difference in number. The various renderings of polyphones are more fully given than in any other list, although there must be omissions, as in the very first character—the single horizontal wedge—of which the value *iddina*, found in Esarhaddon's name, is omitted. Smith, however, omits four or five values, one being as frequent as any—that of the preposition *ina*. In no point, perhaps, is the great syllabary of Menant more complete than this, unless it be in giving the Babylonian variations and the archaic forms, hardly modified from the original hieroglyphics. Possibly Mr. Sayce might have taken a little more care to use a single graphic variety of a character, such as may properly be selected arbitrarily for type. Thus the body of the volume frequently uses for the syllable *an* and the determinative *ilu*—a god—the variation in the form of a cross, not given in No. 4, although made its equivalent as an element of No. 46. So the character *ci* (*ki*) is given in the declension of the noun *naciru* in two different forms, one of which does not appear in the syllabary. The chief trouble with the syllabary is that there is not given in connection with it the order of the various forms of

wedges as adopted in arranging the characters. The student sees immediately that a single horizontal wedge leads the list, but the further order needs elucidation for the pupil, and we are sorry to see that a rigid arrangement is not observed, so that it is not seldom quite a task to find a character, and it is even likely to be overlooked. For a beginner this is a serious difficulty.

A second fifty pages is devoted to a very compact grammar, mainly inflections of nouns and verbs and lists of other parts of speech. This portion is admirably prepared. The Assyrian is printed with great correctness, and the worst mistake we notice is the giving the paradigm of the Ittaphal under the name of the Istaphal, which is quite a different conjugation. Like other English scholars, Mr. Sayce allows a preterite or "permansive" tense, and on this controverted point he is supported by Lenormant among the French Assyriologists. A little more regularity might be observed in the lists of prepositions. Thus, we do not see why the frequent Accad form should be given for *ina* and *ana* and omitted for *ultu*. These are, however, but minor errors and omissions, and scarcely detract from the value of the volume. Especial thanks are due to Mr. Sayce for so complete a catalogue of the meanings of the characters.

---

*The History of Co-operation in England:* its Literature and its Advocates. By George Jacob Holyoake. Volume I. The Pioneer Period—1812 to 1844. (Philadelphia: J. B. Lippincott & Co. 1875. 8vo, pp. 419.)—Co-operation, as Mr. Holyoake points out in his introductory chapter, is a term of very general and vague application, and, in the volume before us, is applied to quite a different set of operations from what we understand by the word nowadays. The "Pioneer Period" was almost wholly taken up with socialistic experiments; and of this period Robert Owen was the prophet. Probably very few in this country have any idea of the extent and importance of this movement in England, contemporary with and allied to the Brook Farm and New Harmony experiments in this country. The volume is therefore instructive as well as entertaining reading. It is—for an American public—rather crowded with names and details, which no doubt call up associations and possess interest in England; but, withal, the story is told in a very graphic style, and in such a manner as to make pretty clear the causes of the general want of success that characterized this period.

Mr. Holyoake is best known as an avowed atheist as well as pronounced radical; and one is agreeably disappointed at not meeting the random sort of talk which might be expected from his antecedents and from some words in the preface, as well as the rather gushing dedication to Wendell Phillips. Only from one or two incidental expressions could one guess at his religious views. He is after all a hard-headed, common-sense Englishman, who sees clearly that it was looseness of thought and building without foundation that caused the ruin of the experiments which he here describes. He has a good deal of humor, too, and in his pages we find many appreciative descriptions of queer reformers, just such as we are familiar with in this country, and keen but good-natured satire—for his criticisms are always those of a sympathizer. There is an account of the "First Concordian" Society at Ham Common, in Surrey:

"The 'New Age' [its organ] was very intelligently edited, but it was discontinued when it had existed little more than a year and a half, on the ground that 'no book could represent what was passing in that establishment. Even the proceedings of a single day were found to be of far greater moment than could be transcribed or recorded in any work whatever.' Those who visited the Concordian were certainly not of this opinion. The inmates were scrupulously clean, temperate, transcendental, offensive to any one who ate meat, attached to Quakers, especially white ones, repudiated even salt and tea, as stimulants, and thought most of those guests who ate their cabbage uncooked. They preached abstinence from marriage, and most things else. Their cardinal doctrine was that happiness was wrong. The managing director, Mr. William Oldham, was called Pater, and, like Howard, preferred damp sheets to dry ones" (p. 230).

There are many interesting reminiscences, some of them valuable as experiments in social science. Such was Mr. Owen's device of "Labor Exchanges," the idea of which, it seems, originated with an American by the name of Josiah Warren (p. 158). "In May, 1833, the National Equitable Labor Exchange, London, was opened." The object of this was not, as might be inferred, to serve as an improved intelligence office, but as a medium for the exchange of the products of labor against one another—in other words, for a systematized and scientific barter. "Those who deposited goods were not paid in money, but received labor-exchange notes of the value of one hour's labor each" (the hour being reckoned at 6d.) Here was the vulnerable point in the experiment: "It does not appear how the depositors of goods at the Gothic Hall estimated the cost of the material they had worked up in hours of the value of sixpence; and persons naturally enquired how the quick workman and the slow one estimated their work on a uniform standard of sixpence for sixty minutes." This confused and inadequate standard muddled men's minds, and, besides, there was a lack of careful and sagacious business management. "The labor exchange needed the pawnbroker's faculty of quickly seeing what a thing was worth." Of course the enterprise speedily failed.

The author, in his preface, pays a handsome compliment to this "wide-awake land" for the prompt and satisfactory responses given to his letter of enquiry in the New York *Tribune*. "No case of any indecipherable caligraphy arose in American letters; they make things pretty plain out there." He does not say how soon the second volume may be expected. Meanwhile he has given the present volume two good indices, and—a valuable feature—has added a "Co-operative Advertisement Sheet," from which one can get a tolerable notion of the leading establishments of the present day in Great Britain—experiments, we will add, which represent the principle of co-operation in its present form, not in its earlier communistic one.

---

*Life at a Northern University.* By Neil N. Maclean. (Glasgow: John S. Marr & Sons; New York: G. P. Putnam's Sons.)—The title of this book is appropriate, the contents being the description of "life" as distinguished from "study." We gain an insight—not a very profound one—into the ways of students at Aberdeen, their diversities of character, and their freaks. But we fail to learn what a Scottish university of the second order really is, how it teaches, what it teaches, and what it requires for graduation. Moreover, the style of the book does not possess those sterling qualities which could alone ensure it long life. The atmosphere is redolent of tobacco and "usquebaugh." We are taught again the lesson that the canny Scot's head and stomach are no less staunch than his orthodoxy. The undergraduate reader can enlarge his vocabulary of "slang," and add several good songs and practical jokes to his repertory. We are confirmed in the suspicion that not a few of the more disagreeable practices of American students, especially such as mar their relations to their professors, are derived, not from the English, but from the Scotch and Scotch-Irish universities. The most interesting, and the only really valuable, portion of the book is that which treats of the poor students and the "bursaries." We are made to feel the stimulus which these scholarships give to study among the poorer classes, and the healthful spirit of equality which they foster. To an American, the description of the supper given by the hero to six of these poor bursars is interesting from its very unqueness. We might almost call it a startling revelation of the craving, the hunger and thirst after a college education. Our country has poor students enough, yet somehow their poverty does not wear such an uncouth mien, their struggles to rise are not so frantic, they do not seem to be so crushed by a sense of overwhelming obstacles. Could some one of our scholars, who has fought his way from obscurity to acknowledged eminence, be induced to give us a faithful record of his college experiences, we might be enabled to compare the workings of the American and the European spirit.

---

*First Book of Zoölogy.* By Edward S. Morse, Ph.D. (New York: D. Appleton & Co. 1875. 12mo, pp. xii.-190.)—When we learned, some months ago, of Prof. Morse's intention to prepare a primary text-book, we were satisfied that the work had fallen into fitting hands. It is one thing to be learned, and another to impart learning pleasantly and effectively. The author's researches in biology might have brought him to the high position he occupies among men of science without proving his ability as an educator of youth; in fact, extent of learning and habitual employment of the language of science are often obstacles to success in teaching. But Prof. Morse's work in the private class-room, and his brilliant career in the lecture-field, foreshadowing the present 'First Book,' show that he possesses the necessary qualifications of a first-rate instructor. He has been judicious in selecting the materials for his work, and skilful in handling them. Without attempting to cover in the whole range of zoölogy (the rock on which the compiler of the average "manual" splits), nor even pretending to lay down many general propositions which the beginner can scarcely be expected to digest, he presents a series of short, simple, and extremely practical lessons in natural history which any child can master, and moreover become interested in mastering. The pupil is plainly taught how to teach himself—certainly the most important of any single lesson he could learn. Familiar objects of natural history, such as may be easily procured in any locality, are selected in illustration of the types of structure they respectively represent; the pupil is told what he naturally first wants to know about them, and also what is most likely to lead him up to the principles

involved. This is done in an easy, almost off-hand manner, without a trace of pedantry; master and pupil seem to be at one. A special charm of the book is that it carries us further out of doors than any other text-book we have seen. We particularly recommend to the consideration of teachers the pithy and practical preface, suspecting that not a few of them must submit to be taught themselves. We have said enough to show that this treatise is thoroughly unconventional; yet parents and instructors need not fear to let their children follow the author when he leaps over the fence instead of going through the gate. In fact, our experience with text-books of zoölogy goes to show that Prof. Morse's originality is a very good gauge of the superiority of his treatise. We should not omit reference to the numerous fresh and novel illustrations which grace the volume—the author is as happy with pencil as with pen. Some of the cuts are amusingly original; for instance (Fig. 91), the wasp, asleep while holding on to a blade of grass with its jaws, is sound asleep to the very ends of its legs. The only errors we have noticed in the work are important ones, which should be corrected in the next edition. On page 167, by an evident slip of the pen, *pelvic* girdle appears in place of *scapular* girdle; and on p. 186, the *Crustacea* appear as a class of *Vermes*, instead of occupying their proper place under the sub-kingdom *Arthropoda*.

BOOKS OF THE WEEK.

## *Debates of Congress Abridged.*

*Forty-third Congress, Second Session* (1874-5).

To which are added the President's Messages and Proclamations, Treaties, a list of Acts passed, and important Reports of Committees. Abridged and compiled by C. H. Jones. 8vo (uniform with Benton's Debates). $5. Sold only by subscription. Sent, carriage free, by the publishers on receipt of the price.

With the favor of the public, a similar volume will be issued for each session of Congress hereafter. Subscriptions are invited for ten volumes, to cover the interval between Benton (who closed in 1850) and the present work.

HENRY HOLT & CO., Publishers, 25 Bond St., N. Y.

## *Democracy and Monarchy in France.*

BY PROFESSOR C. K. ADAMS.

SECOND EDITION, REVISED.

Large 12mo, $2 50.

"Ten lectures and essays upon the most important periods, questions, and men of French History, from the first stir of Revolutionary thought in the eighteenth century down to the catastrophe of 1871. Apart from what seems a want of full appreciation of the work of the Constituent Assembly, and thorough discrimination between the Constitutions of 1791 and '93, it is masterly. Especially thoughtful are the chapters on 'The Philosophers of the Revolution,' 'The Restoration,' and the 'Revolution of 1848.' The chapters on the first and second Napoleonic periods give the very facts which are most difficult of access, and which a thinking man most wants to know. The chapter on 'The Ministry of Guizot' is one of the very few adequate judgments upon the work of that unfortunate statesman."—*President A. D. White, in his 'Bibliography of the French Revolution.'*

"A valuable example of the scientific mode of dealing with political problems, because its propositions with regard to the secrets of French disaster are really an induction from observed facts. It strikes a blow which we heartily rejoice to see coming from a professor of history in a great university. Mr. Adams works out his theory with citation of authorities and illustration in a style which is always clear, and often impressive."—*The Nation.*

"Fully worthy of the important and somewhat painfully interesting theme of which it treats. The summing up in Chapter IV. of the career and character of the first Emperor is very masterly."—*Atlantic Monthly.*

"A luminous exposition of the ideas and theories which culminated in the terrors of the first Revolution, and were brought to a crisis in the downfall of the Second Empire."—*New York Tribune.*

"The subtle workings of the revolutionary spirit are followed with such skill, and its far-reaching effects are traced with such unfailing acumen, as to render Professor Adams's work a contribution to the study of politics in its best or philosophical sense, as well as a most instructive aid to the understanding of the later history of France."—*Appleton's Journal.*

"A political history of the period, which, for comprehensiveness of plan and thoroughness of execution, has nothing like it in our literature."—*Providence Journal.*

"It is full of shrewd and suggestive criticism. The events of the period which it covers are traced with a clearness seldom combined with such succinct brevity."—*The Saturday Review, London.*

"Ten chapters of remarkably lucid writing."—*The Academy, London.*

HENRY HOLT & CO., 25 Bond Street, New York.

## *New School-Books*

JUST PUBLISHED.

### *Easy Lessons in German.*

Eighty Lessons and a Vocabulary. By W. H. and E. K. Woodbury. Cloth, 250 pages, price $1 25.

By mail on receipt of 75 cents, if desired with a view to introduction.

This work aims to teach the rudiments of the German language in the easiest way compatible with German thoroughness. It seeks to be true to its title by presenting, first, that which from its similarity to English is the easiest, and by so subdividing what is more difficult as to fix the attention upon one new principle until ample opportunity is had to completely master it. So far is this subdivision carried that a lesson is devoted to each person and number of the verb, each ending of the adjective, and each case of the noun.

### *WHITE'S Progressive Art Studies.*

INSTRUMENTAL SERIES.

By Major Henry E. Alvord, Prof. of Mechanical and Engineering Drawing, Williston Seminary, Easthampton, Mass.

This series is issued uniform with the Elementary Series recently published. It is to comprise forty-eight cards, neatly enclosed in envelopes of twelve each, with sheets of drawing paper, and an accompanying Manual of Instruction for each set.

NOW READY:

A—ELEMENTARY PROBLEMS. Price 60 cents.
B—ADVANCED PROBLEMS AND MECHANICAL STUDIES. Price 60 cents.

C and D will be ready during the winter.

The above will be sent by mail on receipt of 40 cents each, if desired for examination with a view to introduction.

*** Descriptive circulars, giving detailed information respecting White's Full Course of Progressive Drawing, will be sent gratis on application.

A SHORTER COURSE IN

### *Civil Government.*

Consisting of Seventy Lessons, arranged in topics, with numerous questions for convenience in teaching. Prepared for the use of Common, Select, and Grammar Schools, by Calvin Townsend, author of 'Analysis of Civil Government,' 'Compendium of Commercial Law,' 'Analysis of Letter Writing,' etc. Cloth, 240 pages, price $1.

By mail, for examination with a view to introduction, on receipt of 60 cents.

THE EDUCATIONAL REPORTER for July will be sent to teachers and educationists on application. Address

IVISON, BLAKEMAN, TAYLOR & CO.,
Publishers, Nos. 138 and 140 Grand Streets, New York.

*BOOKS AT LONDON PRICES.* Now Ready: Catalogue No. 6 of Rare, Valuable, and Curious Books, free on application. JOHN EVANS, Importer, 318 Hudson Ave., Brooklyn, N.Y.

## *The Mirror of a Mind.*

A POEM.

BY ALGERNON SYDNEY LOGAN.

16mo, cloth, extra, $1 50.

"The 'Mirror' reflects the phases of a mind too deeply imbued with sadness, but as free from the violence, cynicism, and paradox of which we have had so much as the phrase is free from exaggeration and obscurity."—*The Nation.*

"Mr. Logan's verses do not remind us of any particular poet, but he has the accent of the brotherhood to which Byron, Shelley, and Keats belong—the true sons of song, whose legitimacy can never be called in question."—*Lippincott's Magazine.*

"Mr. Logan's poem, as the name indicates, is subjective, and we are glad to say it is subjective poetry of a very high order."—*Penn Monthly.*

"The poet, looking on the starry sky, the sea, the woods clad in the fugitive splendors that are the precursors of decay, and musing on man, his brief life, his mysterious destiny, records his thoughts in verse of unusual beauty and impressiveness."—*Southern Literary Magazine.*

"Its merits are those of a writer of genius and power."—*New York Herald.*

"The descriptive power is wonderful, rich in coloring, and yet didactic."—*Newark Advertiser.*

". . . Such gems are scattered broadcast through the whole poem—here in a single and singularly felicitous line, there in a succession of original and vivid images; now in a bold and brilliant metaphor, and again in a series of metaphysical vagaries that bewilder while they fascinate and almost startle the reader."—*Philadelphia Evening Telegraph.*

*For sale by all booksellers. Sent post-paid on receipt of the price by the publishers,*

G. P. PUTNAM'S SONS,
Fourth Avenue and Twenty-third Street, New York.

*BANGS, MERWIN & CO.,*
656 BROADWAY,

Will Sell at Auction on MONDAY, Nov. 15, and three following days, commencing at 3½ o'clock P.M., the valuable library of William Clogston, of Springfield, Mass.: A Collection of many Rare and Desirable Books relating to the History and Antiquities of this country, the Indians, Slavery, and the Rebellion, and Works in General Literature, etc.

FRIDAY and SATURDAY, Nov. 19 and 20, at 7.30 P.M.: A Library comprising the best editions of the British Dramatists, an unusually fine series of Books on Belles-Lettres, Works of Biography, Natural History, Illustrated Books, among which are an extensive and elegant series of Dibdin's Bibliographical Works, the Musée Francais and Musée Royale, McKenny's Indian Gallery, etc., Works of Thackeray, Shakespeare, etc.

*RARE AND STANDARD BOOKS,* Engravings, and Autographs. Priced catalogue just issued. Sent free on application.
T. H. MORRELL, 78 Nassau Street, New York.

*"THE READER," on page ii, notices Leslett's 'Timber and Timber-Trees,' 'Ralph and Bruno,' by M. Bramston, and 'Tell Me a Story,' by Ennis Graham.*

# The Nation.

*NEW YORK, THURSDAY, NOVEMBER 18, 1875.*

## The Week.

SENATOR BAYARD, of Delaware, has written an "open letter" on the currency to the editor of the Atlanta *Herald*, in which he denounces inflation with the same boldness he displayed in Congress last winter. Judge Kelley not long ago made a sort of tour through Georgia, during which he, with great audacity, undertook to explain to the Georgians the beauties of an irredeemable currency. We say audacity, because the Georgians and the inhabitants of the other Southern States know by practical experience a great deal more about it than Judge Kelley can tell them, as they had during the war a currency of their own which, from beginning at par or nearly par with gold, gradually went down on repeated issues to a point at which there was a discount on it of several thousand per cent., and, as it has been since described, people, instead of taking their money to market in their pocket, and bringing what they bought home in a basket, took their money in a basket, and brought their purchases back in their pocket. The Georgians know all about "basing" currency on "the entire wealth of the country," for this is exactly what they did, and they found that the entire wealth of the country—the corn, cotton, sugar, and tobacco—remained just what it had been, but the currency did not. For any man in his senses to go down there now and try to persuade the inhabitants that inflation is what they want, must require a good deal of coolness. We are glad to see that Mr. Bayard does not attempt to argue the matter with Judge Kelley, but laughs at him, and reminds his audience that the last panacea he recommended to the poor man was the investment of his savings in the Northern Pacific Railroad, which, in 1871 (he then being a member of Congress), he publicly declared in a speech at Philadelphia to be a "magnificent undertaking." It would probably be a safe thing to back Judge Kelley to ruin in a given time a larger number of his fellow-citizens who should take his advice in pecuniary matters having any political connections, than any statesman now in the field, except possibly General Butler and Mr. Wendell Phillips.

The customary dulness of the subordinate Department Reports has been relieved this year by that of the Supervising Architect of the Treasury, Mr. Potter. He advises the abandonment of the present system of contracts, which gives contractors a percentage on the amount they lay out, and therefore a direct interest in wasteful expenditure, and strongly advises cutting down his own now unlimited and excessive powers to those of a real supervisor of Government architecture. He says that to give one man the duty not merely of overseeing but of actually designing Government buildings is giving him work which he cannot thoroughly or properly do. He adds that "architecture is an art," and, as in the case of all arts, "he who practises it successfully must give himself up to it without restraint," and that "no good work has ever been done without severe study." The announcement of this architectural platform has been received by the press and the public generally with great satisfaction as an indication that Mr. Potter is going to give the Government architecture without any politics in it; that he does not intend to rotate his draughtsmen out and put hod-carriers at work making "elevations" for post-offices, court-houses, and mints; and that he will make a knowledge of architecture rather than an acquaintance with contractors the first test of qualification for office under him. Mullett, his predecessor, must have been hugely amused with the report, and we can fancy him exploding with laughter over the statement that "architecture is an art," and that "no good work has ever been done without severe study." The art in Mullett's time consisted in getting appropriation bills through, and as a "worker" he was unequalled, though he never applied himself to severe study at all, and put up eight or ten millions' worth of buildings a year at that.

It is startling to find in the report of the Commissioner of Internal Revenue the number of United States officials implicated in the whiskey frauds put down at fifty; in other words, there seems to have been about one official conspirator to every common swindler. Mr. Bristow, who has had the support of the President throughout, has got Joyce, one of the leaders of the Ring, sentenced to a fine and a long term of imprisonment, and the trial of John McDonald, formerly Supervisor of Internal Revenue, has begun. It will be a pity if in McDonald's case some enquiry into previous character is not made, as the revelations that would follow would throw a good deal of light upon the dark ways of civil-service reform, and show what is the nature of the causes which so mysteriously produce "Rings." McDonald was appointed by Boutwell, and it was at the time represented to the Secretary by some of the best of the Missouri politicians that the appointment was an utterly unfit one; that McDonald, if not a criminal, was the associate of criminals, and well known as a common gambler and generally disreputable in St. Louis. Boutwell said that it was too bad, but he "could not help it"—*i.e.*, McDonald was backed by too much influence. Now we see what the influence was.

The past week has witnessed a further decline in the foreign markets in that class of Government securities of which the Turkish and Egyptian are types. That U. S. securities have been improved rather than harmed by this, is shown by the fact that the Rothschilds—as the head of the syndicate having charge of the negotiation of the U. S. new Fives—have notified the Treasury that they will take the entire unsold remainder of the $500,000,000, which they have either engaged ahead or expect to sell in Europe. To offset this issue of new Fives the Secretary of the Treasury on Monday called in, for redemption on Feb. 15 next, $12,785,000 5-20 6 per cents, and at the same time issued a call for $5,000,000 5-20s for the account of the Sinking Fund. These two calls of 5-20s withdraw from the markets all the outstanding remainder of the '64 bonds and about $2,000,000 of the old '65s. The only funding bonds which remain now are the 4½ and the 4 per cents, and there is reason to believe that no step will be taken to sell any of these bonds until Congress has had the opportunity to decide, on the one hand, whether it is best to authorize more 5 per cents, and, on the other, whether bond-funding operations had not better be suspended and attention given to greenback funding, or at least to the improvement of that class of the Government debts which form the most important part of our paper currency.

General trade during the week has been good for the season of the year, and there is a feeling among business-men that, unless Congress in some way interferes, the improvement will gain momentum, and that next spring will witness a full business. The number of failures occurring is not alarming, because not unexpected. It is generally anticipated that in the next four months many firms which have been weakened by outside speculations will succumb, the profits of business in the past season not having been large enough to make up for such losses. At the Stock Exchange there has been an advance in prices. A new speculation, which centres in Pacific Mail, has been developed during the week. This is indirectly connected with Union Pacific, that Company having got possession of the steamship line, so as to control every avenue to the Pacific. For some reason Mr. T. W. Park, who controls the Panama Railroad, was not satisfied with the share which his Company got. Accordingly, he devised a plan for an opposition, and

during the week it was published, with the signatures of three respectable shipping merchants, directors in the Panama. They propose to divide the business of the Pacific Mail—which has not for many years been good enough to pay a dividend—and pay large dividends to their shareholders, and at the same time serve the public more cheaply. The last phase of this fight is that Judge Donohue has restrained the Panama from making this highly profitable arrangement by an injunction, on the ground that the charter of the Panama does not permit it to go into the steamship business even for such good purposes as those which animate Mr. Park.

---

At the time when the investigation into the Canal frauds by Governor Tilden began, we pointed out in the *Nation* that the greatest difficulty which the reformers would have to contend against would probably be the fact that some of the worst abuses in canal management had by custom and lapse of time come to be regarded as matters of vested right, which the State was bound not to interfere with. We confess, however, that we hardly expected to meet with so striking an illustration of the truth of the observation as has been afforded by the trial of the two suspended engineers, Yates and Babcock. The facts in the case are very simple: Yates and Babcock were engineers employed by the State to protect its interest in canal contracts. The Governor's investigating commission discovered, in the course of their enquiries, that these engineers had permitted work to be accepted under a contract with Henry D. Denison inferior to the work called for by the contract. Of the fact there was no doubt, and the two engineers were accordingly suspended till they could be tried by the Canal Board. The Canal Board is a commission partly consisting of certain officers of the State and partly of members elected by popular vote. The engineers have now been tried by this board, acquitted, and reinstated in their positions. Under these circumstances—as it seems from the proceedings that no evidence whatever was offered in their behalf as to the facts of the case—it becomes interesting to enquire what their defence can possibly have been, and we find it was that, through a well-established practice, it had become "the custom of the canals" for engineers to accept work inferior in quality to that contracted for. This was the only defence that could be found for the accused, and on this defence they were reinstated. Lieutenant-Governor Dorsheimer put the whole thing in a nutshell by saying that the sum and substance of the defence was that it had become "the common-law of the canals that contracts should not be complied with."

---

There is no exaggeration in this, as everybody familiar with the history of the canals in this State knows. It is probably true that the acceptance by State engineers of inferior work, the system of "unbalanced bids," or, in other words, bids on their face intended as a cover to deception and fraud, and the auction-sales of the contracts among the contractors themselves, have long been recognized as established by custom in the interior of the State, and as having for all practical purposes the effect of law. There is no other way, indeed, of explaining the perfect openness which seems, as a general thing, to have characterized the fraudulent practices; for people who are engaged in fraud usually take the greatest pains to cover their tracks, whereas the "canal men" have carried on their auctions in a hotel in Albany, and so recklessly have they drawn up fraudulent contracts that fraud can be seen in most cases on mere inspection.

---

The resignation of Mr. C. S. Fairchild, who is now one of the assistants of the State Attorney-General, but who will become Attorney-General himself in a few weeks, will probably bring upon him a good deal of abuse, but it seems to us to have been clearly called for by the facts in the case. The District of Columbia bonds belong to a class of securities which, in the opinion of nine men out of ten, are doubtful. They have been talked about in the newspapers as doubtful, they have been speculated in as doubtful, and it is very doubtful what view Congress may take of them. Under these circumstances, they were obviously not proper securities for savings-banks to invest in, but the people who have been puffing them lately have been making a desperate attempt to secure for them an established credit, by bringing them within the class which savings-banks are authorized to invest in. Instead of going to Congress and getting the matter settled once for all, they have chosen to take the indirect way of getting an opinion from Attorney-General Pratt on the subject. The matter was at first referred to Mr. Fairchild, who gave an adverse opinion, which was subsequently overruled by Mr. Pratt. On this Mr. Fairchild was obliged to take some stand, as he himself would be in Mr. Pratt's shoes within a few weeks. He accordingly gave public notice to the effect that as soon as he became Attorney-General the bonds would not be recognized as proper investments for savings-banks, and, at the same time, resigned his position. This was the only thing he could have done; the dilemma in which he found himself strongly illustrates the absurdity of having such matters decided by the views of Attorney-Generals for the time being. As Mr. Fairchild says, nothing short of the highest judicial authority or Congress ought to decide them.

---

The evidence taken before the Committee of the Legislature on the manner in which this city is governed contains such morsels as the following, illustrative of the régime which the Anti-Tammany reformers have succeeded in restoring and confirming:

"The first witness, William P. Dixon, a resident on the Boulevard, said that he had watched the laborers, and found that out of a gang of fifty or sixty only twenty or thirty would be at work, and nine or ten would go some distance back to play 'seven-up'; he once walked four times from One Hundred and Sixth to One Hundred and Tenth Streets, in the same time it took a laborer with an empty cart to go there once; the men, in his opinion, only did three and a half hours' work per day; the cost of the work was about twice more than it would be if the work was done conscientiously.

"Mr. Cyrus Clark, of No. 741 Fifth Avenue, a property-owner along the Boulevard, counted the men at work, and out of a gang of twenty only two would be really performing labor; the remainder were 'loafing about,' and some of those engaged on the sewers were playing cards; there was an official, now in office, who told a contractor who offered to do the work with blasting machines at one-half the cost now imposed by the laborers: 'The objection to your machines is that they can't vote.'"

It is, however, but just to the "reformers" to say that they have not been boastful or exultant since the election. On the contrary, they are for the most part apologetic or defensive, and confine themselves to showing that they have not done as much mischief as people think they have, and that Kelly is not a good man. Some of them reveal an inclination to follow the example of Tweed's counsel, and "deny the whole story." But for the publicity of the thing they would probably deny their alliance with the Short-Hairs. Of Morrissey they seldom speak, and their allusions to him are so vague that a stranger might suppose he was a retired clergyman engaged in managing a children's hospital up-town. As to the general public, its feeling about "the reform" reminds one of the Irishman to whom some wags "tendered," as the reporters say, a ride in a sedan-chair, and then put him into one which had neither seat nor bottom. After he had trudged along on his feet for some distance, they asked him how he liked it, and he replied frankly that, "if it wasn't for the name o' the thing, he'd as lief walk."

---

The election in Brooklyn this year has had the effect of stimulating reform on one side of the East River almost as much as it has paralyzed it on the other. The Ring or Rings in Brooklyn have borne a suburban relation to the Rings in New York. They have been managed substantially in much the same way, but not on so grand a scale or with such a flagrant defiance of law and decency. We have among us not merely our "village Hampdens," but our village Tweeds, Sweenys, Halls, and Connollys too; and there is a certain resemblance between a large overgrown suburb like Brooklyn and a village community in frauds as well as other things, as

cannot have escaped the notice of those who followed the revelations of the Beecher-Tilton scandal. That frauds in the public works have been committed in Brooklyn does not seem to be a matter much disputed, but what redress can be had is another question. The law recently passed by the legislature enabling actions against local peculators to be brought by the State is now before the Court of Appeals in Tweed's case, and what is to be done in Brooklyn will depend a great deal on whether the Court sustains the act or not. The press is very wisely avoiding all discussion of the questions involved in this case while the matter is in the hands of the judges, which is very well; but it is unpleasant to think what a venal and licentious howl will break forth if the Court decides in Tweed's favor. Their adverse decision on Tuesday, however, on his application for a bill of particulars and reduction of bail, will do a good deal to regain popular favor for them.

The interment of Guibord was successfully and peacefully accomplished on Tuesday, amid great military preparations to prevent any outbreak, but with the troops kept in the background. The ponderous, burglar-proof sarcophagus designed to resist all attempts at disinterment was finally abandoned, and the simpler device of burying the wooden coffin in cement was resorted to. Mme. Guibord is even safer from sacrilegious disturbance than her husband, for she lies directly under him, and a layer of cement placed above her serves as a foundation for his receptacle. She died, it will be remembered, in 1873, or four years later than her husband, and yet, so altogether anomalous is this case, she was buried before and beneath him, with an inscription on her coffin showing her to have been the widow of a man who still lacked a resting-place in a civilized and Christian country. We seem now to have arrived at an end of the matter, so far as the poor subject of it is concerned. The law has prevailed, and the Church must, as is her wont in such circumstances, fall back on her unrestricted privilege of cursing. The Bishop will probably not encourage any desecration of the grave by the baser members of his flock, and at most it is likely that the unholy spot will be marked off in some way from the consecrated ground. The *Institut Canadien* will still have the satisfaction of feeling that the point gained was worth six years of struggle with Catholic bigotry.

The English papers are full of discussions of Turkish finance and of schemes for enabling the bondholders to get their money. The mixture of anger and hopefulness displayed at the meetings is something very entertaining. Server Pasha has published a circular showing that the Ottoman Government is one of the most delicately honorable governments in the world, and that the sole reason for its suspending just now is the necessity of reducing the taxes. There is an angry controversy going on in London between the creditors who lent on the pledge of certain specified portions of the public revenue and those who lent on "the entire wealth of the people"—the former, Mr. Kelley will be surprised to hear, fancying they have a prior claim on Turkish resources. But the probabilities are that "equal and exact justice" will be dealt out to all of them. One point debated anxiously is, whether the Khedive will continue to pay his tribute into the Bank of England, even if he is forbidden by his suzerain or not. The prevailing opinion is that, out of regard to his own credit, which is very much shaken, he will. Sir Samuel Baker and others have come to the support of his credit by showing that, unlike the Sultan, he has spent enormous amounts in real material improvements, such as the construction of railroads and of irrigating canals, and the improvement of ports, and the opening up of lands in the interior to cultivation. But, then, many of his railroad enterprises cannot pay for some time to come, and in pushing his territory southward he has involved himself in liability to a series of small but costly wars. Costa Rica, Paraguay, and Honduras have been punished for cheating by having their representatives in London passed over in the invitations to the Lord Mayor's dinner given to the diplomatic corps—a penalty under which, we imagine, these rascally communities will bear up bravely. Spain is now reported as cheating again by paying her overdue coupons in paper. She has added $1,000,000,000 to her debt since 1863, and it now amounts in all to $2,000,000,000, but, as she has not paid any interest on it for two years, it sits very lightly on her; still, she has to borrow at enormous rates, if she can borrow at all, and has probably "funded" more coupons than any other modern nation. The creditors console themselves with the reflection that the revenues of the country are growing, and that the time may come when the Government may pay its interest if it pleases. Altogether, the money-lenders in Europe are having a varied and, it is to be hoped, instructive experience of the improvidence and dishonesty of borrowing communities.

The text of M. Gambetta's important letter to the Lyons democrats upon the existing political situation, has come out by the last mail. He announces that the Republic was really founded on the 25th of February last, and that it brought with it security and confidence, and the result is now about to be submitted for its approval to the people, and he is confident as to the result. He favors the *scrutin de liste* rather than the *scrutin d'arrondissement*, as being "a struggle of principles rather than a struggle of persons," and as permitting the alliance in each department of "all fractions of the loyally constitutional party." He says the nation has gained in experience and practical reasoning, and is tired of the orators who led it astray and of the fanatics who "would lead it back to a past whose very name it cannot bear." As regards the future, he maintains that what the country desires is the repeal of all exceptional laws, the freedom of the press, the right of meeting, municipal independence of the cities and communes; but it does not seek all things at once, and desires all changes to be made "with circumspection, prudence, and temperance," for in politics men should be ready to come to terms with necessity, and "never to risk the fate of a people or an idea for the honor of a hopeless theory." He predicts the formation of two great constitutional parties, "the Whigs and Tories of the Republic, disputing for the suffrages of public opinion, and regularly succeeding each other in power," and in this united France he thinks the old class-hatreds would disappear. The whole document breathes the spirit of a lofty moderation, and shows that years and experience are producing their effect, and that M. Gambetta is fully satisfied that the only Republic which can succeed in France is a Conservative Republic. How well his Radical associates will put up with his moderation remains to be seen, but the promulgation of such a manifesto by such a man is indeed a cheering sign for France. It produced a great sensation among all parties.

The Germans have at last succeeded in erecting in front of the Prussian Chamber of Deputies, in Berlin, the monument of Stein, for which the subscriptions began to be collected nearly twenty years ago, and the unveiling of it has been perhaps the most interesting ceremony of the new Empire, for he may be said without exaggeration to have laid the foundations of the Empire. Few countries were ever in a more deplorable condition than he found Prussia, and it was the changes he brought about in its social and political organization which made its subsequent greatness possible. He procured the abolition of the cabinet, or, as it is called in Austria, the camarilla, composed of private and irresponsible court advisers, who stood behind the king and often overruled the ministers. He abolished serfdom and commuted the forced labor due by the peasants to the landlords for a fixed payment in money, on terms which have gradually resulted in giving them the freehold. He made the purchase of land open to all classes instead of being confined to the nobility, and thus fostered the growth of a middle class. He restored local self-government to the great majority of the Prussian towns and to the provinces, and, besides founding the University of Berlin, was mainly instrumental in organizing the present public-school system. He was, in fact, in all respects one of the greatest men of this century. He did for Prussia what Turgot might have done for France had Fate been kinder to him and his country.

## MR. SHERMAN ON RESUMPTION.

THE Cincinnati *Commercial* has been interviewing Senator Sherman on the so-called Resumption Act, passed last winter, and its report shows what a very strengthening and invigorating effect the recent elections are having on the minds of the politicians. Mr. Sherman is a very good specimen, and indeed is a leader, of the small body of representatives and senators who busy themselves with the solution of the currency question. He has had a hand in every financial measure of importance which has passed Congress since the war; he has been originating bills, conferring on bills, defending bills, and attacking bills ever since the country began to "prepare for resumption"; and, from his position at the head of the Senate Finance Committee, has more power and influence with regard to the currency than anybody except the Secretary of the Treasury or the President. Yet he has never shown himself to be a man of strong and bitter convictions on any political subject, but is addicted by nature to compromise, and much prefers what is called "bowing to the will of the people" to taking a bold and possibly unpopular stand on a question on which the people have not distinctly made up their mind. He has, indeed, probably a secret feeling that all questions in finance on which there is violent opposition between two extremes could be settled by means of a compromise devised by sagacious statesmanship. Last winter, on finding that there were two parties, one of which demanded immediate resumption, and the other immediate inflation, he compromised the matter by getting a bill passed providing for resumption at a date so remote that no inflationist could feel any anxiety about it, and for inflation as soon as the national banks should care to inflate. Mr. Sherman is, in fact, an excellent representative of the politician of the day, and his opinions, however little value they may have in other ways, serve as a very good index of the ebb and flow of the opinions of "the masses."

The sum and substance of what Mr. Sherman says now on the subject of resumption is, first, that an attempt will very likely be made this winter to repeal the Resumption Bill, but that it will unquestionably be defeated; that such an attempt would be a most dangerous experiment; that it would be a "step backward," while "the people (in the elections) have demanded a step forward"; that it would "authorize all holders of bonds of the United States to duplicate them in currency, to the amount of ninety per cent. of their par value, without any fear of being called upon to redeem within this generation"; that "free banking without a fixed time for redemption is an indefinite postponement of resumption"; that under the act as it stands gold enough can easily be provided—out of the surplus revenue of the Government, or by the sale of bonds, supposing the act to remain unrepealed—to enable Mr. Bristow to resume on the 1st of January, 1879; and, finally, that to do this we must have a President strongly in sympathy with the hard-money movement and a Secretary of the Treasury strongly in sympathy with him.

That there is a good deal of truth in all this cannot be denied, and it shows in a gratifying way how Mr. Sherman has been "braced up" by the vote in Ohio and Pennsylvania. Comparing his present position with that which he occupied during the currency debate of last winter, a great change may be seen. Then, instead of the whole matter being as simple as he now represents it, it was so complicated that even on the question of a "reserve" he was unable to make up his mind. In the course of the debate, it will be remembered that the question was raised by some of the bolder senators whether the eighty-two million greenbacks to be retired under the bill could be reissued or not—a rather material point, as, if they could, the bill was a wild inflation scheme under the baldest possible cover; and this question had already arisen before as to the "reserve" retired by McCulloch, and then reissued at will whenever Boutwell or Richardson fancied that the market needed "easing." It was really one of the most important questions that could be asked concerning the bill, and what Mr. Sherman did with it was to evade it. He declared (according to the report of his remarks in the *Congressional Record*) "frankly" that "he did not propose to decide that question in this bill"; that the question "would be met" when "the time arrived." He left "every senator to decide for himself what the law was," and added the characteristic reminder, that "it was not wise, as practical men dealing with practical affairs, seeking to accomplish a result, to introduce into the bill a controversy which would prevent the unity necessary to carry out the good that is contained in the bill." In other words, he considered it "unpractical" at that time to enquire whether the bill was a real measure of contraction or was to be the first step in a new scheme of inflation. Shortly after the passage of the act he was taken to task for this, and declared, in a letter to the *Financier*, that the eighty-two millions could not be reissued; that "he stated so while the bill was pending"; and that no lawyer could put a different construction on the bill.

We bring up these quotations from the "record" of Senator Sherman not for the purpose of convicting him of inconsistency or of insincerity, but to point out why it is that what his friends call his "manly utterances" on the currency question will probably fail to reassure the public wholly. The trouble with them is that, after putting several of them side by side, you cannot make out what, taken together, they mean. Senator Sherman, in his interview, does not say a word on the subject of the reissue of the eighty-two millions of greenbacks, and within a year he has declared officially that it was a question which every one must make up his own mind about, and unofficially that it was a question about which there could be no difference of opinion. When we reflect on how the measure from which Mr. Sherman expects such brilliant results was passed, on the present condition of this elementary question as to reissue, on the popular dread of contraction—even in the late campaigns no one dared openly to advocate it, but speeches were mostly confined to denunciations of inflation, a matter quite different—on the fact that gold is higher now than last year or the year before, on the character of the statesmen whom Mr. Sherman and Mr. Bristow must rely upon to help them to resume in 1879, and, finally, on the great doubts whether the party to which they belong will remain in office more than a year longer, it is impossible to feel the confidence which Mr. Sherman expects to inspire.

That resumption would, economically speaking, be easy enough, as Mr. Sherman says, we have never doubted. The difficulty in the way is a moral, not an economical one, and it is curious, too, to observe that the moral dread of anything more positive than "gradual steps," as the platforms have it, "in the direction" of resumption, which Mr. Sherman, from his cautious way of speaking of contraction, evidently shares, is based upon a delusion which it might be supposed the actual experience of an irredeemable currency would before now have exploded. We have pointed out in the *Nation* that the worst effect of contraction—that it alters the value of contracts and prices—has actually been brought into play as effectively as possible by the wide fluctuations in the value of paper since the war. The "shrinkage" caused by an immediate repeal of the Legal-tender Act would to-day amount to fourteen or fifteen per cent., which is probably very little if at all more than the margin which has to be added to the prices of everything now to allow for a possible change in the relations of gold and paper; while within the last ten years we have seen fluctuations, the exact reach of which could not be calculated beforehand, of 50, 75, 100, and 200 per cent. The process of "growing up," which some of the statesmen of the Boutwell school expect such great things from, is simply disguised contraction. In open contraction, the amount of the currency is decreased; in this veiled contraction, the volume of transactions which the currency must answer for is increased; yet you hear statesmen of this school paint the one as a process full of hope and joy, and the other as certain to lead the country in six months to ruin. So, too, the felicitations of some financiers on the prospect which we now have of reaching the "bottom"—a consummation which simply means a shrinkage of prices, labor, and contracts from 25 to 100 per cent.—sound very queerly

when we find that they wholly object to any alteration in the value of labor, contracts, or prices through a diminution in the volume, or repeal of the legal-tender quality, of the currency. For the purpose of opening the eyes of the public to these delusions, to convince them that the obstacles in the way of resumption at an early day are bugbears, probably nothing would be so effective as the repeal of the Legal-tender Act, and we certainly hope to find that a certain number of the new representatives this winter will be bold enough at least to attempt it.

## THE CHURCH AND THE POOR.

THE Episcopal Church Congress and the Moody and Sankey Revival have given religious topics unusual prominence in the press and on the platform during the week. It is worthy of notice that both the revivalists and the members of the Congress have called especial attention to the difficulty encountered by both ministers and evangelists—as it is the fashion to call the revivalist preachers—in securing the attendance on religious exercises of the great body of the poor and irreligious people commonly called "the masses." It has been already a frequent subject of lamentation that the revivalist meetings in Brooklyn are frequented by professing Christians who seek to have their zeal quickened, rather than by the outsiders, who have as yet given no sign whatever of religious interest. At the Church Congress, the most animated discussion in the whole proceedings was upon the failure of the Church to secure the presence of the poor at her services. In fact, in this city, and in nearly all cities, the consolations of religion do not reach those who most need consoling. Those to whom this life gives least seem to take least interest in what the future life may have in store, or, to put it differently, seem to care least whether there is any future life or not. In fact, it is impossible to enter either the Brooklyn Rink or any church in the city, except the Catholic, without being struck by the fact that Christianity seems among us to have lost its original character, as *par excellence* the religion of the lowly and miserable, and to have become the religion of the comfortable and well-to-do. It is now an old story, that to become a pewholder in all the leading churches in this and other cities is to become a stockholder in a wealthy and flourishing corporation; and the more powerful the preacher, the more it costs to hear him. One of the signs of a man's material prosperity, indeed, is his appearance in church. If he fails in business, or things go wrong with him, his attendance ceases. If he is very poor, he never shows himself in church at all. The best churches he cannot afford to go to, and the eleemosynary churches he scorns to go to. The practical result of church organization in our day is, indeed, that in the very circumstances in which temptations are most powerful, and spiritual aids to hope and courage and purity most necessary, it is hardest to secure them We do not believe Messrs. Moody and Sankey have thrown the least light on the problem. We have no doubt that nine-tenths of their hearers, at least, are persons already connected with religious organizations or the near relatives of such persons, or members of the well-to-do classes attracted by curiosity. Mr. Moody's discourses are plainly, in their very method and phraseology, addressed to persons who are already familiar with both, and, indeed, with the whole mechanism of revivals. Nor do we think much has been said in any of the recent discussions on the subject that is very suggestive as to the remedy. The most heartily applauded paper read at the Church Congress was by the editor of the Philadelphia *Bulletin*, and was especially addressed to this subject; and though it is perhaps unsafe to judge from the meagre report, which is all we have seen, he had nothing better to urge in the last analysis than that the existing church-goer should display more religious enthusiasm. But the account he gave of the indifference of pewholders to the religious condition of the non-pewholders was virtually a confession that the pewholders are not animated by the Christian spirit, and made the subsequent call on them to display the Christian spirit—that is, the burning propagandist zeal which has given the Church all its triumphs—sound like a hollow form. It was like telling a man who does not love his mother that it is his duty to love her, and that his course in withholding his affection is erroneous. Did the motives exist to which the preachers appeal, the appeal would be needless.

The causes which have loosened the hold of the Church on the masses are not by any means so superficial as these discussions serve to make them appear, and are not to be overcome by any religious revival. Some of them lie at the very foundations of our civilization, and others are inherent in the voluntary system of supporting public worship. Putting aside altogether the influence of scientific scepticism on all classes, the poor have grown less amenable to religious influences just in proportion to the degree in which the possibilities of this life, as regards happiness and comfort, have apparently been increased. When Christianity first came, poverty was a status in which a man who was born was most likely to die, and down almost to the French Revolution this life was treated in politics and literature, as well as in the pulpit, as simply a period of probation, to be at most endured. Since that period the poor of the Western world have been steadily and successfully taught that the evils of their condition are mainly the result of bad government or defective social arrangements, and that a state of society in which happiness will be equably diffused is within easy reach. The literature of the song-book, of the newspaper and magazine, the oratory of the pulpit and platform, have now for a century been full of this idea, and it has spread wide and sunk deep, and has turned away the attention of the unfortunate from the remote and shadowy consolations of faith to the apparently nearer and more tangible consolations of material progress. It has to be borne in mind, too, that almost every modern state supplies in a greater or less degree to every poor citizen within its limits, without reference to his religious condition, the various blessings which the ancient and mediæval poor sought in the Church—the succor, help, and comfort, the protection and equality. In other words, the state has been so permeated with the principles of Christianity, that it goes far to supply the masses with the blessings which they once found only in the Church itself. One reason, in short, why the poor man has grown so indifferent about heaven above is that he thinks he has found, or is going to find, his heaven here below; and for this state of mind the Christian philanthropist is as much responsible as anybody. He forgot and forgets that the imagination of the ignorant is very defective; that it cannot embrace wide spaces or long periods or many objects; and that, if we fill it with the joys of this world, it is pretty sure to lose its hold on the joys of the world to come. And then the sentimental form which theology has taken in all the Protestant churches, its gradual substitution of somewhat vague moral suggestions for the didactic sternness and definiteness of the old dogmatism, has had much to do with their loss of influence over the poor. The seed of the word as sown in most of the pulpits to-day, needs a soil prepared by the tenderness, grace, and affection of a well-ordered and respectable home in order to take root and bear fruit. In falling on hearts hardened by the fierce conflict for mere animal existence, amidst squalor and hunger and peril and uncertainty, it is apt to fall on stony ground. Of the fact that there exists a close relation between material comfort and susceptibility to religious influences, there has been of late years a certain recognition by the Church in her dealings with foreign heathen; she will have to recognize it more fully before long in her dealings with domestic heathen.

The growth of artistic taste, too, combined with the passion for equality, is striking a serious blow at the voluntary system, as regards the relations of the Church to the masses. The love of beautiful and costly architecture, and of musical excellence and first-rate preaching, has taken or is taking hold of even the simplest Protestant denominations; and good taste, as we all know, is an expensive thing, and the gratification of it involves an attention to the purely business side of church matters which is a serious damper on propagandist zeal. When the pews of a church bring forty or fifty thousand dollars a year, or its music costs four or five thousand, it is not in human nature for the members to hunt up the halt and lame and blind and dirty and constrain them to come in. It would be

fatal to the Church on the commercial side if they did so; and the commercial side, as any deacon will tell you, is, in such a world as ours, in which taxes, interest, and salaries have to be paid, a side that needs looking after carefully. It is, indeed, hard to imagine anything more likely to make religion seem repelling to a poor man than the sight of one of the gorgeous edifices in which rich Christians nowadays try to make their way to heaven. Working out one's salvation clothed in the height of the fashion, as a member of a wealthy club, in a building in which the amplest provision is made for the gratification of all the finer senses, must seem to a thoughtful city mechanic, for instance, something in the nature of a burlesque. Not that the building is too good for the lofty purpose to which it is devoted, for nobody ever gets an impression of anything but solemn appropriateness from a great Catholic cathedral, but that it is the property of a close corporation who, as it might be said, "make up a party" to go to the Throne of Grace, and share the expenses equally, and fix the rate so high that only successful business-men can join. The congregational system of church maintenance, which is now really the system of all Protestant denominations, in which each church is the property of a small club, is incurably unfit for the needs of modern society, and the apparent absurdity of trying to change it is as good an illustration as we could ask of the worthlessness of revivals as indications of the real strength in our time of the Christian idea. The enthusiasm of the Rink, strong and deep as it may seem, has little of the force which conquered the barbarians, built the monasteries and cathedrals, and supplied the modern world with a new foundation for its polity.

## LIFE AT THE ENGLISH AND SCOTTISH UNIVERSITIES—A CONTRAST.

October 25, 1875.

I CAN hardly imagine any greater contrast than that which could be drawn between the social coloring and surroundings of university life in England and Scotland. The existence of a favorite Park hack is very different from that of a Shetland pony in its native wilds, and the experiences of a drawing-room pug-dog and a rat-catcher's bull-pup are not identical. But I am not sure that the fortunes of these animals respectively present a more striking contrast than those of the smart Oxford or Cambridge undergraduate, in his jaunty cap and gown, and the lank Scottish student in his red-flannel cloak. University life in England is, in nine cases out of ten, a pleasant, cheery, easy-going continuation of the jolly life at a public school, with a little more freedom and rather more money to spend on amusement. University life at a Scottish university is an unkempt, hungry episode, where it is all work and no play, and, in the majority of cases, barely enough money to support existence. In England, the undergraduate's motto in many colleges would be:

"Gather ye rosebuds while ye may,
Old Time is still a-flying;
And this same flower that smiles to-day
To-morrow will be dying."

In Scotland, it would be (to borrow Sydney Smith's suggestion for the *Edinburgh Review*) "tenui meditamur avenâ"—"We pursue our studies on a little oatmeal." An Oxford "freshman" comes up from Eton or Harrow, where he had a snug little study of his own, luxuriously furnished for a school-boy, with his sofa and arm-chair and little library of tattered books, his mirror ornamented with a couple of hunting whips and a fox's brush which he had secured in his holidays, and his fox-hunting or stage-coaching pictures hung round in neat oak frames. He had had his own bed in his dormitory, and his bath, and ivory-backed hair-brushes with his monogram neatly inscribed, and perhaps his miniature top-boots, which his vanity prompted him to bring to "the shop" with him in order to excite the envy of his schoolfellows. At college, he has his rooms furnished after the same model, but on a very different scale of grandeur. The miniature top-boots have amplified into full-sized realities. He keeps a couple of hunters and a hack, and goes out three times a week with the hounds when he ought to be at chapel and lectures. He has his man to wait on him, and such time as he can spare from his wine parties, and his late suppers, and his whist, he gives up to the study of æsthetics, or athletics if his taste lie that way, and, if he contemplates a Parliamentary career, to the cultivation of public speaking at the "Union Debating Society." He has a vacation at Christmas, when he goes covert-shooting and hunting alternate days; a recess at Easter, when the attractions of London life will open to him, or perhaps he will take a run over to Paris; and he has a long vacation of three months and a half in summer, when he will ascend great mountains in Switzerland, or go grouse-shooting and salmon-fishing in Scotland with a little deer-stalking thrown in, or, what perhaps is the happiest time of his whole undergraduate career, join a long-vacation reading party in some beautiful spot in the Westmoreland Lake country or the north of Devonshire, with two or three congenial spirits whom he has known from boyhood, and read and bathe, and flirt with the young ladies in the neighborhood, and discuss modern poetry and ancient philosophy, with all the ardor and enthusiasm that health and vigor and comfortable means and freedom from care inspire in British youth.

And now, take a student at a Scottish university. He is not unlikely the eldest of eleven brothers and sisters brought up in his father's bothie, consisting of a "butt and a benn," in the West Highlands of Scotland. His father is a shepherd with £20 a year of wages, besides his house, cow's grass, and croft or potato-field. The lad had walked to the parochial school—six miles there and six miles back—every day, winter and summer, since he was a child. He had done well there, and his father and mother, more especially his mother, were seized with the ambition, like the parents of Dominie Sampson in 'Guy Mannering,' to see their son "wag his pow in a pulpit." By dint of great sacrifices, they had managed to send him to the high-school at Inverness or Glasgow, and from thence to the university. There he would probably lodge with another student in a garret furnished with a single bed, a small table and a stool, and without a fireplace, for which he would pay 3s. 6d. a week. His whole expenses, including his college fees, would not amount to £25 a year; and this he would probably earn in the summer by teaching a school in some remote part of the Highlands, or perhaps as "ghillie" to an English undergraduate on his Perthshire moor. Or, failing any such wage-bringing occupation, he would return to his father's cottage and help him to herd his sheep all day, and teach his brothers and sisters in the evening.

I do not mean that all English undergraduates are necessarily the pleasure-loving and pleasure-enjoying lads I have pictured; nor that every Scottish student shares a lodging with another at 3s. 6d. a week. But I do not exaggerate when I say that a not inconsiderable proportion of men at Christ Church, University, and Merton Colleges in Oxford, and at Trinity and Magdalen Colleges in Cambridge, do lead very much such a life as I have described, and, what is more, that they turn out to be useful and active members of society after their crop of wild oats has been taken in. At Balliol and Corpus and New Colleges in Oxford, and at Kings and Trinity—because Trinity is a sort of Noah's ark which takes in animals of every kind—in Cambridge, there are many hard-reading men who are only a little less industrious than the Scottish students. And, with regard to these latter, I have stumbled upon some curious facts which bear me out in my description. It appears that certain statistics were collected in 1867 as to the professions of the parents of the students at the different Scottish universities, which may be summarized as follows: Out of 882 students who in that year attended the Latin, Greek, and mathematical classes in the universities of Edinburgh, Glasgow, and St. Andrews, and the junior Latin and Greek classes in the University of Aberdeen, no less than 29 were sons of common laborers, farm-servants, and miners; 16 per cent. of the whole number belonged to that class of men who live by skilled labor and artisan work, blacksmiths, shoemakers, weavers, masons, carpenters, and the like; 125 were the sons of farmers; 111 were the sons of Presbyterian ministers; 94 of shopkeepers; and 39 of schoolmasters. This is a striking testimony to the cosmopolitan character of the Scottish universities, and goes some way to explain the proud boast of a Scottish Education Commission, that the proportion of matriculated students to the population is much higher than it is in any other country in Europe, or indeed in the world. In Scotland, they say there is one student to every 1,000 of the population, but in the whole of Germany there is one to every 2,600 of the population, while in England it is only one to every 5,800 of the population.

The balance, however, of enjoyment of life is to some extent redressed when we turn from the taught to the teachers, and compare the lives of the dons and tutors at the English universities with those of the professors at the Scottish universities. An old college tutor is one of the loneliest creatures in the universe. He has no wife or, as Isaac Casaubon called the person standing in that relation to him, no "domestic hindrance to his studies," and no children. Most of his friends have got livings in the country, or have gone to London, or have become professors in some Scottish university. He has nothing to bestow affection on except his books; no one to quarrel with except his servant; no one to scold except his under-

graduate pupils, who laugh in their sleeves at the old man's anger and make fun of him among their fellows. He has his rooms in college, his meals in Hall, and his port-wine and coffee in Common-room. But he has no peace in any of the three. His rooms may be just over a rollicking freshman who carries on convivial entertainments till all hours of the morning, or just under a musical or Ritualistic scholar with an unceasing instrument. In Hall there is the constant din of undergraduate prattle, and in Common-room a running fire of classical jokes and academic witticisms from the junior dons. He can never shake himself free of his tutorial duties. Chapel in the mornings, lectures in the forenoons, improving walks with promising pupils between lectures and dinner; essays and exercises, bad Latin prose and worthless Greek iambics, to look over and correct all night. Even his vacations he can hardly call his own. He probably remains in college during the Christmas and Easter recess, and takes a reading party with him in the long vacation. It is a forlorn, monkish, half-developed life. But, withal, it is a useful life, only in nine cases out of ten the utility of it is of the same kind as the benevolent utility of a maiden aunt. There are, of course, very many exceptions to this sort of existence both in Oxford and Cambridge—men who succeed in influencing to the best ends many generations of young Englishmen, who become prominent and useful members of society; and there are others who make names for themselves in the highest paths of literature. There are some, too, who have energy and force of character to do both these things—to do their duty unwearyingly towards their pupils and to become distinguished men themselves. And these men, no doubt, lead as happy and quite as useful lives as the happiest of the Scottish professors. And what an enviable term of learned leisure these eminent professors have! Their university terms begin in November and end in April—just the time a man wants some gentle occupation in a pleasant town like the capital of Scotland. The whole of spring, the whole of summer, and nearly the whole of autumn is their own, to do with it what they like. During all that time they are not called upon to give a thought to their professorial duties. They can go abroad or to their country-houses—and most of them have their country-houses—or to their yachts, or, if they prefer it, they can stay in their university homes, surrounded by their families, and occupy themselves upon some *magnum opus* which will make their fame. And during session, their labors are not herculean. They teach their huge classes of one hundred or one hundred and fifty raw Scottish students, or lecture to them, two hours a day, for five days in the week; and after the fatigues of the day are over, at twelve or one o'clock they return to their homes to luncheon, and are not called upon to give another thought to their students till ten o'clock next morning. No wonder that their life is envied by the English don, who cannot shake himself free of the inevitable undergraduate by day or night. There is, however, one crook in their lot—they are doomed by the exigencies of the Scottish school and university system to teach the elements of Greek and Latin and mathematics, and they have next to no endowments!

## THE ULTRAMONTANE CHECK IN BAVARIA.

October 25, 1875.

BAVARIA was the last to leave the stage of German politics this summer, and now she has been the first to reappear on it. Thanks to the tactics of the Ultramontanes, this opening of the political campaign has been of great dramatic effect; whether it is to have any material results of great importance, only the future can reveal. Some Liberal papers try to persuade themselves and the public that a decisive victory has been won; in fact, only a violent but exceedingly ill-managed attack has been repulsed.

You remember that the Ultramontanes had elected a majority of two into the Lower Chamber, 79 against 77; since then one of the Liberal delegates has died, so that at present the parties stand 79 to 76. There was from the first no doubt that, on the strength of this majority of two, the Ultramontanes would claim it as a right, which the Government was bound scrupulously to respect, that the present cabinet should be forthwith dismissed. Dr. Jörg went so far as to blame the Ministers severely for not evacuating the field as soon as the result of the elections was known. But even if Bavaria could be admitted to be a constitutional state, in the sense we are wont to attach to the word with regard to England, the model constitutional monarchy, the precedents would not fully bear out the claim of the Ultramontanes. I need not remind American readers for how long a time Pitt faced a much larger hostile majority in the House of Commons. The contest lasted from the 17th of December, 1783, to the 8th of March, 1784. In sixteen divisions the Opposition triumphed. But the "angry boy," as only a short time before Sheridan had called Pitt, stood his ground until he had reduced the majority of the coalition to a single vote in a full House, and then he dissolved Parliament, appealing to the nation, and coming out of the new elections "the greatest subject that England had seen during many generations." In this respect, therefore, the Bavarian Ultramontanes want to outdo the constitutionalism of England; while, on the other hand, they take exception to the very corner-stone of parliamentary government as understood in England. Among the great quantity of misdemeanors laid to the charge of Dr. Faeustle, the Minister of the Department of Justice, his being a member of the Lower Chamber has been so strongly emphasized that he has thought proper to subject the charge to a full and close examination, deeming it even necessary to resort to precedents for his justification. According to his accusers, a cabinet minister can hardly have the time to attend with due diligence to his duties as a delegate, and, principally, it cannot be proper for him to accept of a seat because his judgment as a delegate must be influenced by the fact of his being a cabinet minister. Have these people ever so much as heard of there being a great kingdom known by the name of Great Britain? A constitutional monarchy with a so strictly parliamentary government that a majority of two against them in the Lower Chamber should cause the cabinet to resign at once, and in which it is nevertheless highly improper for a minister to be a member of the Lower Chamber, is certainly an invention worthy to challenge the highest admiration. And the best of it is that there is not the slightest trace of constitutional law in this valiant onset for the maintenance of constitutionalism in Bavaria. Not only does the letter of the Bavarian constitution know nothing of its being the duty of the king to select the members of his cabinet in conformity to the views of the majority in the Lower Chamber, but such a fetter on the will of the sovereign is also most unquestionably against the spirit of it.

It is, of course, fully admitted on all sides that a permanent disagreement between the "Government" and the Chambers on the whole tenor and tendency of the policy to be pursued would finally result in a fatal standstill of the whole political machinery. The minority only insist that, rather than yield to the present majority, this danger should be incurred for a while, in order to try whether a favorable turn of the party scales cannot be brought about. The telegraph will have informed you that the king has adopted this view, and prorogued the Landtag for an indefinite time on the 19th inst.

The Ultramontanes had overcharged their gun, and it has burst. From the very first moment they were anxious to show in a most signal manner that they were determined to bend the king at the first onset at the risk of breaking—not him, but their own small chance, which they had secured by the utmost exertions. The "Bureau" of the Chamber was composed entirely of Ultramontanes, though it is a pretty well-established usage in our representative bodies to accord a share in it to large minorities, and though the Liberals, when they had the majority, at once offered the Opposition one seat in it. So there was no doubt left that what I ventured to predict some months ago had actually taken place: the lead had been accorded to the extremists. And yet the actual state of affairs is not quite correctly so to be described. Infallibility is evidently not confined to the Pope. If there is another instance in the parliamentary history of the world of one man exercising such a despotic sway over his party as Dr. Jörg has done in this session of the Bavarian Landtag, and of a party glorying so much in playing the part of a senseless herd, I have never heard of it. Dr. Jörg, as chairman of the committee to prepare the draught of an address to the king, obstinately refused to make known his draught to the members of the committee before the formal discussion of it. Though this was another flagrant violation of a well-established custom, the chairman was fully sustained by the majority of the committee, who—again trampling under foot all precedents—voted further to have the room cleared of all members of the House attending the debate as listeners and spectators. When the Liberals complained of unfair play, because the draught had undoubtedly been concerted in a caucus of the Ultramontanes, Dr. Jörg emphatically denied it, declaring that nobody beside himself had the slightest knowledge of it. Mr. Von Stauffenberg, the leader of the Liberals, was therefore certainly correct in declaring that he could not treat it as the draught of the majority, but only as the draught of Dr. Jörg. The committee, however, as well as the House, swallowed it whole without wincing. According to certain ultra-democratic papers, Dr. Jörg has proved himself a political tactician of a very high order, first, by carefully avoiding to proffer any specific charges against the cabinet, with the single exception of the gerrymandering of the election districts; and, secondly, by not so much as alluding to the "Culturkampf." The quarrel about the election districts can hardly be of interest to Americans. Suffice it to say that the Augsburg *Allgemeine Zeitung* has proved, in three long and very-carefully prepared articles, that,

from whichever point of view one may look at the question, there is not the shadow of a foundation for the complaints brought against the cabinet on this head. So the only specific charge falls to the ground, while the general accusations appear in such a dress that the Ultramontanes, if they themselves believed in their justness, would have shamefully failed to do their duty in not proposing at once the impeachment of the Ministers.

That this bullying tone would make an impression on the king was certain enough, but to suppose that it would have the desired effect was exceedingly naïve. The king has many peculiarities which will always be a great temptation for *Kladderadatsch*, but he is a perfect and high-toned gentleman, quick to resent the slightest attack on his royal dignity; with all his jealous watching over the sovereignty of Bavaria, a good German patriot; and not only in his romantic whims, but also in all other things, of a lofty, though eccentric turn of mind. As neither the coarse abuse of the Ministers, nor the still coarser flattery showered on himself, could produce anything but disgust in his mind, so something more than the mere not mentioning of the "Culturkampf" would have been necessary to deceive him about the plans of the Ultramontanes. Dr. Jörg, while priding himself on the fact that he is the first Ultramontane who ever took a seat in the Bavarian Landtag, passionately disclaims that the present majority of 79 are the representatives of the Ultramontane party, or, in fact, any party at all; they are nothing but "Bavarian patriots," striving to save Bavaria from being swallowed up by the Empire, and to secure once more to the country the blessings of justice, liberty, and peace. The Ministers, on the other hand, have declared, in so many words, that what these "patriots" are really aiming at is to bring the state under the yoke of Rome, and the king has refused to receive the address and has kept his cabinet, expressing in the strongest terms his full confidence in its integrity and statesmanship. And this declaration is, by royal command, to be sent to every burgomaster of the kingdom, and to be read by him to the assembled community. The historical word of his ancestor, "I will have peace with my people," of which Dr. Jörg had tried to make a stumbling-block for him, the royal hand has taken up to use as a war-club. Now the Bavarian people hear, in a manner which admits of no quibbling, what the real opinion of their king is with regard to the political manœuvres of their priests, and we shall see who has the strongest hold on their hearts—the King or the Pope. Were it indeed a master-stroke, yet without the hoped-for effect, no blame would fall on him who has dealt it. What its probable effect will be you may learn from the very best authority. The *Germania* writes: "Our party is not yet so far along that it can already attain decisive successes; we should, therefore, deem it a misfortune if a momentarily favorable constellation of circumstances should give it a victory which it could neither maintain nor sufficiently improve. The Bavarian patriots are for the present saved from this danger." But, in spite of this authoritative testimony, I repeat what I said in the beginning—no decisive victory has been won, but only an exceedingly ill-managed attack repulsed. Space and time forbid me to give to-day the reasons on which this opinion rests, but opportunities enough will be offered to throw sufficient light on them in future letters, though these may treat of subjects without any apparent connection with this question.

# Correspondence.

## CAN CONGRESS REISSUE GREENBACKS FOR EVER?

To the Editor of The Nation:

Sir: A correspondent in your No. 539 suggests the propriety of Congress passing a law to restrict legal tender to gold and silver after July 4, 1876, but he can hardly have much faith in believing that Congress will ever pass such a statute. I do not, however, think it necessary, because I believe such is the law to-day, though my faith is not very strong that the Supreme Court of the United States would so declare it.

The cases of Knox *v.* Lee and Parker *v.* Davis (12 Wallace, p. 457), which reversed Hepburn *v.* Griswold and sustained the constitutionality of the legal-tender clause, gave the war as the excuse for the legislation, and go no further than to justify the legal-tender clause during the war. The Court says, p. 553, "for the time being"; p. 560, "during the pending exigency"; p. 563, "for the time being"—afterwards, on the same page, defined to be "when the exigencies of the State rightfully absorb all subordinate considerations of private interest, convenience, or feeling," and, p. 567, "upon extraordinary and pressing occasions, such as war or other public exigencies of great gravity and importance." So the last statute authorizes the issue of greenbacks "if required by the exigencies of the public service, and for the payment of the army and navy and other creditors of the Government"; and with regard to the reissue of the notes one statute says: "From time to time, as the exigencies of the public interests (in another statute 'services') shall require." Finally, on this point the Court says, p. 567, "And should be no longer exerted than all the circumstances of the case demand"; and, p. 541, "It is urged now after the lapse of nine years, and when the emergency has passed."

It is true that the question when the exigency ceases is one which the Court declares is within the discretion of Congress, but this discretion goes only to the determination of the time when the greenbacks shall be redeemed, and unfortunately, under the decision, if not otherwise controlled, would leave Congress able, as I fear it is too willing, to neglect for ever to redeem the greenback, and thus practically make it read "this is a dollar"—a conclusion which the Supreme Court was not willing to allow, although unwilling to deny.

The greenbacks are not a legal tender to-day; first, because of the reissue of notes from the $44,000,000 which were retired, cancelled, and destroyed, and their commingling with the $356,000,000 of original notes outstanding, and the consequent destruction thereby of the possibility of proving a legal tender, since the reissue notes are not a legal tender, and their separation from the otherwise legal-tender notes cannot be made. Second, because the emergency which called the legal-tenders into existence has passed; and the notes, which are certificates of debt, and are so declared by the Supreme Court, have been, since the cessation of the exigency, all redeemed by the Government in internal-revenue receipts, and, although reissued from time to time, have been so under conditions of peace, and must be tested as to their legal-tender quality by the circumstances of the time of their reissue. The reasoning of the cases in the Supreme Court would not now justify them; and the matter is not within the discretion of Congress, since the reissue is a different thing from the redemption of the greenback. The redemption has been made, and the discretion of Congress is exhausted. The reissue is as if no such note had ever been out.

Even if the Court should extend the discretion of Congress to the reissue of the greenbacks, such extension would be limited by the language of the acts themselves to be exercised only so long as the exigencies of the public interests or services should require; and the redemption by the Government of its bonds before their maturity is too plain proof to be gainsaid that the exigencies have ceased. With their cessation has ceased also the authority given to Congress to reissue greenbacks. J.

Cincinnati, O., Oct. 30, 1875.

[J. D.'s reasoning strikes us as remarkably sound, but the misfortune is that the Supreme Court, in laying it down that Congress has the right, at its discretion, to issue irredeemable money, has thrown open the doors to a wide and arbitrary exercise of power which it cannot now control. Down to the time of the reargument of the legal-tender cases, the Court had the matter within its grasp. They might perfectly well have brought the legal-tender delusion to an end by their decision, but they were afraid to do it, and the result is that, as our correspondent points out, they have made it impossible to say what the limit of the legal-tender power is. Apparently Congress can, if it chooses to say that the "public exigencies" require it, do anything it pleases with the currency, and the vague, weak, and vacillating opinions in the legal-tender cases seem to show that little is to be hoped from the Court of last resort. The fact is that constitutional law as a protection against the paper-money madness has broken down; we have little to hope for from any system of hermeneutics that may be adopted at Washington, and we must rely now on our own exertions to restore the currency to a sound condition.—Ed. Nation]

# Notes.

Henry Holt & Co. announce as nearly ready a fifth volume of Mill's 'Dissertations and Discussions,' consisting of five papers on land tenure and various reviews; and two editions of Taine's 'Philosophy of Art in Italy.' Next year they will publish also the latter's 'Genesis of Contemporary France.'——The Misses Smith, of Glastonbury, Conn., whose struggles with the tax-collector have given them a wide notoriety, announce through the *Woman's Journal* that they are about to publish through a Hartford firm an original translation of the Bible. They make the rather

surprising statement that they have written out the Bible (*sic*) five times—twice from the Hebrew, twice from the Greek, and once from the Vulgate.——Gen. W. B. Hazen, U. S. A., has just printed at Minneapolis a small pamphlet entitled 'Some Corrections of 'Life on the Plains.'' Gen. Custer, in the work cited, had blamed Gen. Hazen for protecting at Fort Cobb the Kiowas fresh from the bloody engagement of Washita ; and Gen. Sheridan had adopted this view. Gen. Hazen puts the matter beyond dispute. Some few Kiowas, but not those by agreement under his charge at Fort Cobb, took part in the fight at Washita ; and duty not less than humanity constrained him to prevent Gen. Custer's command from slaughtering in their lodges the then peaceful and unoffending main body of the Kiowas.——G. P. Putnam's Sons have in press a Japanese romance, entitled 'Chinshingura ; or, The Loyal League,' translated by Fred. V. Dickins, with notes and an appendix containing a metrical version of the 'Ballad of Takasagi.' Fac-simile illustrations of the original Japanese text and of Japanese engravings will also distinguish the volume. Messrs. Putnam are to be the American publishers of the international 'Library of Contemporary Science,' of which three volumes—on linguistics, biology, and anthropology—are already announced.——Trübner & Co.'s fall announcements include 'Sketches of Anglo-Jewish History,' by James Picciotto ; a new edition of Greg's 'Literary and Social Judgments,' with a portrait of the author ; 'Christianity and Buddhism Compared,' by the late R. Spence Hardy ; 'Chinese Sketches,' by Herbert A. Giles ; and a collection of Chinese proverbs by William Scarborough, Wesleyan missionary at Hankow.——Among the fictions which are announced to appear in the excellent French juvenile *Magasin d'Education*, are 'Le Courrier du Czar,' by Jules Verne, one of the editors of the magazine, and translations of Mr. Aldrich's 'Story of a Bad Boy,' and Mr. Bret Harte's 'Baby Sylvester'—this last by M. Th. Bentzon, who has contributed to the *Revue d's Deux Mondes* many translations of characteristic sketches of American life and manners.

—We have received from the Historical Society of Pennsylvania their new historical map of that State. Although it is the result of more than twenty years of research on the part of the compiler, Mr. P. W. Sheafer, it is in the nature of a first proof, and is sent out for corrections and additions by the learned in such matters. So far as we are aware, no other State has ever been mapped in this way ; for New Jersey and Delaware, however, the present sheet contains a large number of details that would prove most useful to their respective cartographers. In Pennsylvania we have the physical features sufficiently indicated, along with the county and other territorial divisions ; the several purchases from the aborigines ; the Indian trails ; the sites of forts, battle-fields, and naval engagements ; the various settlements, with date affixed, etc. Especially has an effort been made to preserve the Indian names of places, rivers, and mountains. The State boundary lines at different epochs are also carefully laid down, most famous as well as most familiar being Mason and Dixon's. Across the Delaware is marked the Province line between East and West Jersey, still traceable in the western boundaries of Ocean, Monmouth, and Somerset Counties. The scale of the map is about twelve miles to the inch, and for the larger portion of the State this gives ample room for the lettering, but in the counties along the Delaware either more room was desirable or more artistic lettering. In fact, if the Society could afford it, one would feel inclined to recommend putting the present map as raw material into the hands of professional map-makers like those of Gotha, or, to go less far away from home, like Mr. Julius Bien and his assistants in this city. But it will doubtless be best to await the much-needed scientific survey of the State. Meantime, we suggest to the Society whether it be not practicable to make a series of smaller maps, of the size of the text which accompanies this one, and to be bound ultimately in the same covers, showing at convenient periods the extent of settlement in Pennsylvania and, in the manner of Gen. Walker's 'Statistical Atlas,' the density of population.

—The full report of Rohlfs's expedition in the Libyan Desert is to be published in three volumes by T. Fischer in Cassel. The first volume will constitute an independent book, and contain the leader's general report. This will be accompanied by engravings, a map, and sixteen photographs, after those of Remelé taken for the Khedive, of whose excellence and rarity we spoke in No. 514 of the *Nation*. The other two volumes are to contain details of the scientific work of the exploring party, including the results of a full examination of the collections brought back to Europe. The first volume is now appearing in monthly parts. The distinguished explorer made his first public appearance in this city before the American Geographical Society last Thursday evening.

—Professor Richard A. Proctor, in one of his recent lectures on astronomy, has been following the example of Professor Tyndall, by "abandoning all disguise" with regard to the origin of things. The New York *Tribune* thought and said that he had announced his "conversion" to the doctrine of evolution, but he writes to that journal to explain "what has really taken place." We give the account of it in his own language :

"Let the dogmatic teachings of a particular church be called A, and let the teachings of science be called B. Then either (1) A and B are consistent, or, being inconsistent, the error lies (2) with A or (3) with B. Two years ago I was satisfied with the first of these explanations. But you know what happened after the Belfast address. Theologians, who ought at least to know what their Church requires, proclaimed loudly that the views B are utterly inconsistent with the views A. They convinced me that that is so; while I remained as well satisfied as ever that views B are right in the main. My obvious inference is that some error exists in views A. Theologians who teach A assure me that I must either accept A without question or depart from among them. My choice between these alternatives could not be doubtful. Hence, simply the most marked circumstance of my change of position."

We think we can make the matter even clearer than this without the aid of a diagram or of algebraic signs. Prof. Proctor was, we believe, a Catholic. Until lately, he thought the dogmatic account given by his Church of the origin of the world was reconcilable with the teachings of science. In the year 1872, however, he learnt from certain theologians, who disapproved of Professor Tyndall's Belfast address, that he had been mistaken, and received notice from them that if he adhered to the teachings of science he must "depart from among them" ; and he has accordingly done so. Now, the only thing remarkable in all this is that Professor Proctor, although a scientific man, should have held that two views of the origin of things, one of which he now confesses he did not understand, were entirely compatible. That a gentleman who forms his opinions in this loose way should have recently had his eyes opened to the error of one of them is, or ought to be, doubtless, a gratifying circumstance to his personal friends. But it can hardly be said to have much scientific or public importance, and we think both the *Tribune* and Mr. Proctor himself have given too much attention to it. A scientific man, as such, can properly only hold that the teachings of science and those of a particular Church are consistent after a proper examination of both. If he reaches or has reached this conclusion without such examination—or, in other words, has held it unintelligently or ignorantly—his proper course is to say nothing about the matter, and politeness requires that his friends should not allude to it.

—Preparatory to a prolonged absence in Europe, a collector in this city recently sold six pictures, which have since been on exhibition at Knoedler's gallery. They are "Partie Perdue," by Meissonier ; "Molière chez Louis XIV.," by Gérôme ; "Les Contributions Indirectes," by Zamacoïs ; "La Fin de la Journée," by Jules Breton ; "Les Enfants de la Princesse Clothilde," by Alma Tadema ; and "La Halte de la Diligence," by J. G. Vibert. With the exception of Zamacoïs, the artists are all living. The price paid (reported as $50,000) was probably the largest ever given in this country at private sale for six pictures, and there seems to be little doubt that it was far less than the market-value in Paris, whither the purchaser at once shipped them for sale. Most of these paintings were originally bought in 1866, and a good profit has now been realized upon them. The Zamacoïs was the most judicious investment; it was purchased from the artist before the opening of the salon of 1866 for twenty-five hundred francs. Before it left the salon ten thousand francs was offered for it ; it has now been sold for about fifteen thousand francs, and the buyer has already refused an advance of fifteen per cent. ; he holds it for sale at twenty-five thousand francs. It is to be regretted that these pictures could not have remained in this country. The Meissonier was probably the finest specimen of the artist's work ever brought to America. The Vibert was sent over to Europe two years ago at the artist's request to be exhibited in Vienna. The "Molière chez Louis XIV." was the original ; a replica was painted in 1866 by Gérôme's pupils for the use of the engraver, which was afterwards retouched by the artist himself and sold. Molière has been introduced by M. Gérôme, this time in conjunction with Scarron, into a more recent picture exhibited in the salon of 1874, "Une Collaboration," of which there was a wood-cut in the *Art Journal* for last February.

—Before Gérôme, Ingres had painted "Molière chez Louis XIV."; and yet there would seem to be no truth in the anecdote which suggested the pictures. M. Eugène Despois, the editor of what is likely to be the standard edition of Molière, devotes to its demolition a whole chapter of his interesting volume on 'Le Théâtre Français sous Louis XIV.,' which he sarcastically entitles "La Légende de l'en-cas de nuit." Molière was an hereditary valet-de-chambre of the king, and as such assisted in the formal making of the king's bed. According to the anecdote, some of the noble valets objected

to such association with a comedian. To rebuke them, Louis XIV. ordered in the repast which was always ready in case the monarch should feel hungry in the night, and, commanding Molière to sit down, his majesty himself helped him to the wing of a chicken, in the presence of the discomfited courtiers. This is a very pretty story, and it is almost a pity that it is not true. But the evidences in its favor are so slight as to be well-nigh valueless, while the evidence against it is so strong as to be well-nigh overwhelming. In the fierce light which beat upon his throne we see the life of Louis XIV. as we can see that of but few men. Every incident of his long reign is down in black and white in the interminable memoirs and correspondence of the time. But in neither letter nor diary is there any reference to an incident which in the eyes of the courtiers would have been of unexampled importance. The story was first made public in 1823 in the memoirs of Mme. Campan, who said she had it from her father, who had it from an old physician-in-ordinary to Louis XIV. Since 1823 it has been repeated time and again. But there is positive evidence to corroborate the negative. Saint-Simon declares distinctly that except in the army the king never ate with any man, not even with the princes of the blood-royal, excepting only at the feasts he gave them at their weddings. In short, the story rests solely upon the second-hand authority of an anonymous physician. M. Despois despairs of ever weakening the popular belief in the incident.

—In No. 534 we mentioned the swindling sales of so-called American degrees carried on abroad. The subject has been ventilated again of late in the English papers, and the London *Lancet* expresses the hope that Congress may be led to do something for the regulation of medical degrees among us. The character of these bogus degrees has been so often and so fully exposed (we believe one was overhauled in a German court last winter) that one might suppose the demand would have ceased. Mr. Sparke's correspondence with the educational authorities in Washington and Pennsylvania, to which we alluded the other day, resulted in an announcement that the charter of the notorious "American University of Philadelphia" was revoked some years ago. If this mean before the autumn of 1873, it has certainly had little influence on the operations of the active agents for the sale of its diplomas abroad, though the advertisements have been less numerous this summer than for some time. We are informed that in October, 1873, "Medicus" continued to promise an "M.D." or "Ph.D." in consideration of $125. He was still distributing a little tract, dated "October, 1872," and *printed in German* for "private circulation among students and candidates [for a degree]," setting forth the innumerable privileges and facilities of the "University" as well as the eminence and literary activity of its "thirty to forty" professors (particularly of Dr. J. Buchanan), but above all calling the attention of intending foreign candidates to P. F. W. van der Vyver, Dr. jur. (?), of Jersey (Eng.), who was authorized to arrange for parchment certificates of an education in their absence. Mr. Sparke's experience shows that "Medicus" (*i.e.*, v. d. Vyver) is still active, and we learn from a Philadelphia paper that he last year extended his operations to Spain. He is not wanting in a kind of grim humor, and once informed a correspondent that his university was "a far superior establishment than the Harvard College" whose new degree in Philosophy he was asked to *purchase*. Philadelphia is not alone in the glory of this trade. A London agent recently offered to procure the LL.D. degree of the "Livingstone University" (Haddonfield, N. J.) "in consideration of a subscription to the building fund." In September, a certain (or uncertain) E. Sturman ("Packington College, 145 Packington Street, London, N.") wrote an assistant of a leading firm of London druggists: "I can influence you the diploma of A.M. and Ph.D., or B.Sc., or D.Sc., etc., from *several universities in the States* . . . if you will send the fee (£15) I will send you the document at once with the registration certificate." No names of universities were given, and the correspondence was unfortunately published without waiting for details.

—Meanwhile, the traffic still goes on in Germany. Within a few weeks one of our correspondents has been offered a degree in Medicine or Philosophy by a Berlin agent. He proposed a document from Philadelphia or Haddonfield in return for $130. The degrees were declared to be very popular, and to have been extensively sold, and to be useful "in the provinces as well as in Berlin." The Berliner knew of no choice in the "Universities," and, pressed for particulars, sent the annual announcement for 1873–4 of the "American University of Philadelphia," as advertised by "John Buchanan, M.D., Dean." It may seem superfluous to devote so much space to such a subject. If foreigners care for this sort of thing, it may be said, let them get cheated. Bogus degrees, however, are not like poor mowing-machines or bad oil: the fact of their being sold at all has reflected severely upon all our higher institutions of learning. It is not enough to reply that German universities have had a very bad name too, so bad that some years ago one of the best of those in Prussia, exasperated by frequent enquiry from England concerning the price of a degree *in absentia*, felt called upon to announce publicly that it only gave degrees upon examination. All interested in the higher education among us may be very sure that these bogus degrees have really done us harm by lessening, where possible, foreign (and particularly German) esteem for our colleges. Many an American has been abashed on being asked by educated Germans, and in earnest, too, if this Philadelphia concern (whose abode is or was 514 Pine Street) be not our first University. And perhaps none of our institutions is safe from the insult of being addressed by traffickers on the other side in letters like the following, which we are permitted to publish, and which, it will be observed, is a very late instance:

"2 Lombard Court, Grace Church Street, [altered to]
Parker, 89 Chancery Lane,
Solicitor. "London, England, 9 October, 1875.

"Sir: I have a student with me who is desirous of proceeding to the degree of B.A.* *in absentia*. I therefore beg to enquire if your University will confer it upon him, and if so, what fees shall I remit for?

"Writing you in strict confidence, I am, yours truly,
"Thomas Parker.

* Or M.A.

"To the Secretary Antioch College, Yellow Springs, Greene County, Ohio."

—The following case of "journalism" occurred in the New York *Times* of November 13 and November 15. It is curious and instructive to see the way the quotation-marks are worked in as the writer gets heated and reckless over his own errors. The Italics are ours:

(*The Nation*, *November* 12.)

The plain facts of the case are *that the Reformers solemnly called on Tammany two years ago to reform the organization and expel the bad men.* So Kelly, assisted by a few respectable men like Mr. A. S. Hewitt, did drive out Morrissey and his following, probably the worst lot of rascals by which any Christian city was ever infested.

The above, as journalized by the *Times:*

(*Times*, *November* 13.)

Then the *Nation* said that "Morrissey and his kind" *were driven out of Tammany Hall two years ago*, whereas nothing of the sort took place two years, or even one year, ago.

(*Times*, *ovember* 15.)

The *Nation*, with astonishing ignorance of all the facts, says that "*Morrissey* and his kind *were driven out of Tammany Hall two years ago.*" Morrissey was, indeed, driven out a few months ago, in consequence of a personal quarrel with Fox and Kelly—but was Fox, a much worse man in every way, driven out?

—Messrs. Head & Meek, of Wine Office Court, Fleet Street, London, have published a curious series of reprints of old English newspapers and gazettes from 1538 down to modern times. They all made their original appearance at important dates, and give the public the benefit of important news. The first of them is the *English Mercurie* (published by Authoritie. For the Prevention of false Reports), dated at Whitehall, July 23, 1588, containing the earliest intelligence of the descent upon the English coast of the Spanish *Armado*, and the naval fight between the galleons and galleasses of Duke Medina-Sidonia and the English under the Lord High Admiral as well as Sir Francis Drake, and Rear-Admirals Hawkins and Frobisher, who, about one in the afternoon, with eighty sail, came in sight of the Spanish armada "sailing in the form of a half-moon, the points whereof were seven leagues asunder." The galleons and galleasses were of a size "never seen before in our seas," and appeared like "floatinge castles." Nevertheless, "acclamations of joy resounded through the whole fleet," and the action began which ended so disastrously for the pride of "our bigotted and bloode-thirsty adversaries the Spaniards." No. 19 of the *Weekely Newes* (January 31, 1666) contains an account of the execution of Thomas Winter, Rookewood, Keyes, and "the great Devil of all, Guy Fawkes, *alias* Johnson," whose body was so weak with torture and sickness that he was "scarce able to go up the ladder, yet with much ado, by the help of the hangman, went high enough to break his neck by the fall." As we come down to modern times, we find newspapers announcing the Death of Oliver Cromwell, the Plague, the Great Fire of London, and among the files of the *Times* the news of the Battle of the Nile, of Copenhagen, of Trafalgar, the funeral of Lord Nelson, and finally, the Battle of Waterloo. Altogether, the collection is curious and interesting, though it has an illusory effect in bringing us, for perspective, almost too near the great events of the past. To journalists the collection will be very interesting, as it throws a good deal of light on the progress of the newspaper from the time when it was a sort of official bulletin issued "for the prevention of false

reports" to the present century, in which journalism has become a profession the members of which have for their chief duty not the suppression but the dissemination of reports of all sorts.

—A report from Cavallari (*Bullettino della commissione di antichità e belle arti di Sicilia*, No. 7, Parte Prima, Palermo, 1874) adds considerably to our knowledge of Selinus and its ruins. In 1872 Cavallari discovered the extensive necropolis of Selinus; in 1873 and 1874 he burrowed further, and found in all directions graves with vases. In order to complete his plan of Selinus, he undertook to find the street leading out from the city to the necropolis. Removing the masses of sand, he came upon the ruins of a smallish stone building, nearly square, and of the purest Doric, apparently of the fifth century before Christ, although in this matter of dates there is still some uncertainty. Some 800 lamps and statuettes were picked up in the building and its immediate vicinity. An inscription, of which almost the only word legible was HEKATAI, led to the conjecture that it was a temple of Hekate. But it now appears from the full plan and description that there is no cella, and, furthermore, both the east and the west ends are alike open. In all probability, therefore, it was a sort of portal or lodge to the cemetery. If so, it is the only building of the kind known. Further excavations on the acropolis of Selinus have unearthed quantities of weapons on the spot where Cavallari puts the agora. As the last stand made by the men of Selinus against the hordes of Carthaginians was, according to Diodorus, xiii. 57, in the agora, it is a strong argument in favor of Cavallari's theory of the situation of the agora, and it may well be that the arms lately found were the identical ones used in that unequal and desperate struggle.

—The excavations near the Dipylon at Athens are still going on; they have reached the lower floor of two houses, with remains of mural paintings. In one was a small collection of money, fifty-six coins of Athens and of Mithridates. Word has come to Athens that the part of the Elgin Marbles lost by shipwreck near Cerigo has been discovered by the aid of divers. A commission of the Archæological Society has gone to Cerigo to raise the sunken treasures, if possible. The survey of Athens and its neighborhood is pushed on with vigor under the direction of the Prussian engineer Kaupert, who received a furlough in March last to enable him to take charge of this very important work.

—Garibaldi's plan for improving the Roman Campagna has recently been the subject of very adverse criticism in the Augsburg *Allgemeine Zeitung*, under initials that suggest the capable editor of the *Ausland*. He has paid considerable attention to the literature of the subject, and uses Prof. Filopanti's little book as the exposition by which the plan is to be judged. His conclusion is by no means flattering to the much-lauded project, which he declares ought to satisfy no one having the real development of that part of Italy at heart. Too much stress is laid upon the regulation of the Tiber, far too little upon the improvement of the Agro Romano. The value of the proposed work at Fiumicino is much exaggerated, and the changes to be made in the river are given a totally disproportionate consequence. Any plan for improving the Campagna, says the critic, must use three important enemies of malaria: human dwellings, canals for drainage, and trees. Not only the great swamps of Ostia and Maccarese must be removed, but all standing water must be drained off. Trees must be planted in great numbers—preferably the eucalyptus, though other trees of rapid growth and abundant foliage will do. Along with these tree-plantations must go the work of colonization, a factor of prime importance in the regenerative process. To render this work practicable he proposes that a beginning be made at the lower end, where a strip of coast (usually free from malaria) would be in the rear as a protection, and the work gradually pushed forward in the less dangerous season with the south wind, and leaving only improved colonized land behind. It is, however, admitted that some considerable regulation of the Tiber will be required.

## LLOYD'S AGE OF PERICLES.*

THIS is a handsome book in two volumes, of some four hundred pages each, devoted to the history of Greece for the fifty years between 479 and 429 B.C. No one who knows that period will think this too much space for the full story of it. Mr. Lloyd's treatment is minute and elaborate, and in many respects valuable. We cannot help wishing that the plan had been somewhat different—that he had expanded the introduction so that the opening of the history itself with the evening after the battle of Salamis might have been less abrupt; that he had omitted some of the anecdotes and detailed narratives, such as that of the Corinthian and Corcyræan sea-fights, which have been well enough told before and seem to contribute nothing to his purpose, so as to gain room for more of original discussion of his proper theme; that he had not stopped so suddenly with the death of his hero, but had gone on, as even Thucydides in the same circumstances does, to consider the immediately-following years as throwing some light backwards. We notice, too, what seems disproportionate space given to Themistocles, who is really the hero of the whole first volume. Still, we welcome the book as it is, for, as a contribution to scholarship, the knowledge of what antiquity can tell us about itself and the criticism of that information, it has real value. Mr. Lloyd's criticisms are concerned mainly with minor points of chronology, the different departments of art, and the relations of art to history. One is tempted to wish that in his evidently wide reading of Greek authors he had caught something of the admirable clearness of style which marks most of those of this period. He has a habit of describing in roundabout phrase, instead of directly naming the thing he means, and another, of qualifying an expression by adding another of different or equivalent meaning, which load down his sentences. It wearies the reader needlessly to have to grasp such sentences as the following, which are not extreme examples. Speaking of state expense for public amusements, he says (I. 228), "So does the prudence at least, if not the obligation quite so readily, become in some degree recognized, of giving more unity to the system of society by a better diffusion of enjoyment, as well as comfort, than is the outcome of the vaunted, of the so often misstated and misunderstood, law of supply and demand." Again, in connection with the siege of Samos (II. 142), "It is happy that indignation should be unanimous on at least atrocities of this nature, though in truth they add but a very trifle to either the wickedness or [the] miseries that are involved, with applause no less unanimous for the actors, in what is known at this day as civilized warfare." But passing over such details, as well as some few misprints and inaccuracies, we propose to consider the more prominent features of the book.

The principal novelty in Mr. Lloyd's view of the 'Age of Pericles' consists in the connection which he endeavors to establish between art and history. This is made prominent on the title-page, and might perhaps have been anticipated from his previously published studies in art-criticism. Taking into consideration, so far as in any case may be possible, the time of a work of art, its peculiar myth or character in any respect, the position and relations of its author to other leading men, he makes out a theory from all these data as to the designed political bearing of the painting, poem, or sculpture. For, to use his own words in his preface, "at this particular time a work of art was apt to have the significance of a political incident, as its purport and vicissitudes had no unfrequent bearing on political feeling." There is no proof of this statement, and there hardly can be any except success in proving such intent in actual instances. In the single case of music, however, where we have even less knowledge of special works than in painting, he gives an outline of the general principles of Greek musical theory, and then indicates the effect upon the character of the people of the development of it in practice as a whole. The best idea of the method will be got from examples, and we take two which seem most elaborate and most satisfactory to the author.

The 'Persae' of Aeschylus was the second of a series of plays, the others, none of which is preserved, being entitled 'Phineus,' 'Glaucus Potnieus,' and 'Prometheus the fire-lighter.' It has long been a disputed question what was the purport of the plays, and how they came to stand in connection with the 'Persae,' which is a description, from the Persian point of view, of the battle of Salamis. Mr. Lloyd believes he has found the solution, as follows: The myth of Phineus turns upon his rescue from the persecuting Harpies by the winged sons of Boreas, whose daughter he had married. Now the wife of Boreas was fabled to be an Athenian nymph, and the Athenian fleet was greatly helped just before the sea-fight at Artemisium by this same north wind, on the ground, they thought, of his having an Athenian wife. So Mr. Lloyd finds in the tragedy of Phineus a reference to the battle of Artemisium. Glaucus Potnieus is by his name and in the myth connected with Potniae, on the battle-field of Plataea, so this tragedy is referred to that battle. Finally, Prometheus the fire-lighter, a satyric play, and therefore of comic or mirthful tone, represents the joyful ceremony of bringing from Delphi sacred fire to rekindle that of the altars of Plataea after the battle, and as fire is "the type and cause of all gladness, purity, and health, symbolizes the restoration of Hellas after the dispersion of the dark barbarian cloud." Thus the four plays correspond to the three great battles of 480–79 B.C. and the final repulse of the Persian invasion. The objection to this theory may be easily

* 'The Age of Pericles: a History of the Politics and Arts of Greece, from the Persian to the Peloponnesian War. By William Watkiss Lloyd.' London and New York: Macmillan & Co. 1875.

stated. It introduces a principle of combination of plays into a tetralogy by a historical link entirely outside of the myths of the plays, which is not supported either by the one extant example (the Oresteia of Aeschylus) or by any just conjecture as to the drift of lost plays whose names are preserved in connection. It supposes, what we think the Greeks would have considered a violation of artistic propriety, that the poet inserted a purely historic play between two of mythical tenor referring in a recondite way, we might almost say by a pun, to battles closely connected in time with the one described. Mr. Lloyd's idea that the 'Persae' had also the design of glorifying Themistocles in opposition to Cimon, son of Miltiades the hero of Marathon, is in conflict with that of other scholars (for instance, Paley in his notes on the play), and seems to have no real foundation. When, to support it, he speaks of the "suppression of every allusion to Marathon by Aeschylus," he forgets line 475 (Dindorf), where the name Marathon occurs, as well as several other unquestionable allusions to that battle. And when he says "the name of Themistocles is suppressed throughout," he seems to overlook the fact (as we think it to be) that no tragedy contains the name of a living Greek.

In a chapter on the 'Prometheus Chained' of Aeschylus, the attempt is made to find in that grand character a reference to Themistocles, who, at the date Mr. Lloyd assumes for the play, was in exile at Argos. The parallel rests on the following points: Prometheus is called at the opening of the play son of Themis Orthoboulos, and further on son of Gaia; Themistocles dedicated a temple to Artemis Aristoboulos, and claimed connection with the Lycomid gens at Athens who worshipped Gaia. Prometheus deserted the Titan party in the struggle in Olympus; Themistocles "may have entered politics by attaching himself to a party from which he ultimately slipped away" (this Mr. Lloyd considers "a hint for history" derivable from the poem!). Prometheus declaims against the ingratitude of Zeus; Themistocles may consistently with his character have declaimed against that of the Athenian people. Prometheus gave men fire, and taught them how to build houses and ships; Themistocles restored the hearth-fires of Athens by the victory of Salamis, built up a new city there, and created the Athenian fleet. Prometheus sympathizes with Io, the Argive heroine; Themistocles's policy brought him into close connection with Argos. Finally, the two characters are alike in sagacity, daring, versatility, confidence in the future, and craftiness. Now, it must be admitted that these points are all true, one by one, and there is ingenuity in thus combining them, but the whole thing goes off and leaves nothing behind when one reads over the play. The poet must have had a far higher idea in his mind, one so far above this that it is impossible to believe he could have written such a poem with any such secondary allusion present to his thought. It belittles play and character, in our judgment, to ascribe them to a desire to glorify Themistocles, and indeed Mr. Lloyd himself seems partly conscious of this after he has finished his parallel. We cannot share his naïve wonder that "the drama should have been so constantly read, its passion so sedulously scanned, and not have recalled the character of Themistocles." These two examples fairly represent his method of connecting art with history, and seem to prove that it is rather ingenious than trustworthy, suggesting, perhaps, interesting thoughts, but shedding no real light upon either of the connected subjects.

After all, the most important question about such a book as this is as to the general impression which it gives in regard to the man and the period under discussion. Mr. Lloyd's picture of the age is on the whole better than that of the man from whom it is named. Any student of Greek antiquity will find here something to interest him in the chapters on the painting, the sculpture, the architecture, the music, the literature, the philosophy, the tribe distinctions, the forms of government, or the politics of that period of vigorous, multifarious, original, and marvellously successful activity. Yet the multiplicity of details forbids thorough treatment of any one department, and obscures, partly by the somewhat confused arrangement, the outlines of the leading figure. The character of Pericles—the most complete and symmetrical character in Greek history—is indeed fairly and correctly set forth, but not vividly nor with full appreciation. Mr. Lloyd has not caught Grote's intelligent, sympathetic admiration of Pericles as a statesman, nor does he show the exhaustive knowledge and masterly analysis of Curtius. We regret that he did not think worthy of more than passing reference the famous criticism made by Plato in the 'Gorgias,' that Pericles cannot have been a good ruler of men, because he left the Athenian character worse than he found it, as is shown by their censure of him near the close of his career. Nor do we find any satisfactory discussion of another criticism, more difficult to meet, that he managed the state well himself, but developed such a character in the people that none but a man as able and self-controlled as he, and as favored by circumstances of external prosperity, could govern them, nor could they govern themselves wisely without such a leader.

## GIFT-BOOKS FOR CHILDREN.*

'TWO Campaigns' is scarcely to be called a child's story, and yet is hardly adapted to maturer minds. It is a sort of half-grown juvenile romance; and a youth who has liked 'In the Year '13' of Fritz Reuter, and yet is neither well informed nor acute enough to perceive the difference between that excellent little historical picture and one based upon the wildest improbabilities, may enjoy also 'Two Campaigns.' The first part of the story is told by the hero, Max Roggenfeld, now grown old. His adventures carry us through the campaign of '93, when the Austrians and Prussians entered republican France. He is nearly destroyed under an accumulation of disasters, and, after the first campaign, goes to England, not to reappear until the second, which is that of 1812–13, when he joins Napoleon's forces. At the close of the war he is left in charge of the children of a dead comrade, and the story then makes another skip of twenty years or so, bringing us to an extraordinary concatenation of circumstances. One of the orphans, who are children no longer, falls upon a chain of evidence which, being followed up at once without the slightest difficulty, results in restoring all the Alsatian estates of the principal characters, which had been confiscated in '93, to their rightful owners or heirs. There were three of them, adjoining one another, and the French gentleman who holds them, on being made acquainted with the facts, relinquishes his claims with a promptitude and politeness which, if imitated in this country, would make courts a superfluity and the pursuit of misappropriated property a pastime. Yet another twenty years elapses, during which Max and his lifelong friend, the Countess of Wildenstein, have lived happily in their old homes; and the book then closes with their death, both being octogenarians. They die hand in hand, just after having had a conversation in which Max understands for the first time in his life that the Countess has always loved him. It is, perhaps, no detriment to young readers that the author has no weak leanings toward love affairs. His treatment of all his lovers will certainly prove disheartening to those who think a "happy ending" to a novel consists in something more than a restoration of family property to the right line. But in spite of the heavy use of tragic materials—which was of course to be somewhat expected, considering the period of the story—and the presentation of characters with only grand sentiments, there is nothing whatever between the two covers to affect the callous adult to a tear. It is really entertaining to see how close the author will let the lovers come without touching, as you may say. They are hardly permitted to understand each other, much less to have a chapter or even a page of happiness together; but, like the old-fashioned stage tragedy, the character "dies" at once whenever the effective moment comes. We cannot help suspecting a writer of this turn of a rather morbid fondness for playing on the melancholy tendencies of sensitive boys and girls. If a passion for country had been substituted for the passion of love, the latter could have been reasonably subordinated to it with good effect. But the patriotism exhibited in the 'Two Campaigns' is of a very cloudy character. We find ourselves among a mixed sort of Alsatians, who are fitted out first with German and then with French sympathies. The only distinct principles laid down are—that a good soldier must have no opinions, and that he must be always loyal to his company or regiment. The general morality of the book is pure, and respect for those in authority is always inculcated.

The device of collecting a number of old picture-plates, and getting a story written to illustrate them, is made use of more and more every year, so that the sort of children's books it calls forth now almost form a class by themselves. Decidedly the best we have ever seen of the kind was 'Roundabout Rambles,' not only because the author appeared to have turned to account every possible suggestion of his picture, but more especially because each picture was the subject of a separate story. Where all the pictures have to be brought in to illustrate points in one continuous narrative, the result, though generally an evidence of great ingenuity on the part of the compiler, is apt also to show a want of coherence and aim in the work which relegates it at once to the already large ranks of ephemera that appear every Christmas—a fate from which no beauty of binding or print can save it. 'Frisk and his Flock' and the 'Doings of the Bodley Family' are two very handsome and profusely bepictured—it seems like putting the cart before the horse to say "illustrated"—books of

* 'Two Campaigns: A Tale of Old Alsace. By A. H. Engelbach, author of 'Lionel's Revenge,' etc., etc. Published under the direction of the Committee of General Literature and Education appointed by the Society for Promoting Christian Knowledge.' London: Society for Promoting Christian Knowledge; New York: Pott, Young & Co.

'Frisk and his Flock. By Mrs. D. P. Sanford, author of 'Pussy Tiptoe's Family,' 'The Rosedale Books,' etc.' New York: E. P. Dutton & Co.

this species. The latter is indeed especially elegant in make-up. 'Frisk' is for little children, and is an innocent, pretty, wandering sort of history, including among its secular chat frequent texts from Scripture, which have the merit of being sensibly selected and pleasingly used.

The 'Bodley Family' is more important. "Phippy" is quite a character, and her brother and sister are also natural and well-drawn children. Their "doings" are of the usual country sort, but are conducted with sufficient freshness and fun to save them from the wearisomeness of the hackneyed egg-hunting and haymaking legends. A feature of the book is the introduction of poems recited by one or other of the characters. We commend the insertion of Browning's "Pied Piper," "John Gilpin," and the "Heir of Linne." Children will appreciate an odd classic or two given in this way who would not have looked at them otherwise ; and the same could be said of "Chevy Chace" if the language were not quite so difficult. It is rather bloody, too, for the nurseries of these humaner days. The other poetry is not so much to our taste. The "Little Rid Hin" is the best, but its "Irish" is shocking. The fairy pieces have charming vignettes, which were really made for them, but, as in the cases of "Harry O'Hum," "Bumble Bee and Bumble Bug," etc., while the manner is tinkling and taking, the thought is rather thin. The story of "Gran'ther Scupper and 'Lishy" is good till one comes to the disagreeable point of it ; and the love affair between the doll and the boy's head on the kite is silly as it is witless.

'Jolly Good Times' not only deserves its title, but the further praise of being pronounced a jolly good book. We took it up without much expectation of reward, because country life has been a hard-worked theme, and many of the stories about it have had nothing whatever to recommend them beyond the natural attraction of the subject for city children. On this occasion, however, the author has something definite to tell. The Kendall children and their neighbors and playmates live in the Connecticut Valley, not far from Deerfield, and we are given a sketch of their life during one period from the breaking-up of winter till the appearance of snow just after Thanksgiving. The merit of the story lies in its evident biographical truth. It is very plain that "P. Thorne" writes from memory and observation, and not pure fancy. The result is a charming local picture, quite worth the attention of English boys and girls, as showing what New England life is in a respectable farmer's family—plain folks, who do their own work, but entirely free from the low-comic variety of Yankee talk and manners too often considered essential to the success of a New England story. To be sure, Aaron, the free-born American hired man—whom it would be almost a misnomer to call a servant—tells his delightful Indian stories to the children in Yankee dialect, and other characters use it appropriately, but that is not what we refer to. When the admirers of the 'William Henry' series remark the absence of "smartness" among the Kendalls, they will have touched on the element we are happy to miss. 'Jolly Good Times' has one defect of style which may well be remedied in any future volume : we mean the interpolation of descriptive phrases or adjectives in a sort of "reportorial" slang, retarding the action and sounding affected to juvenile ears. Millie does something "expressive of rapture" ; or Ralph says something with a "superior air," "his literary tastes being decidedly bloodthirsty." They are in every case superfluous, and one who reads aloud to children will find himself instinctively skipping them.

'Nine Little Goslings' answers to nine different stories, each with a Mother-Goose title for a remote suggestion or "starter," as it were. For instance, "Lady Queen Anne" is a little girl who is happy under all circumstances ; "Ride a Cock-horse," a child circus-rider ; "Little Bo-peep," a girl who peeps into a forbidden chest, etc. The stories would amuse, probably absorb, most girls and some boys in their second seven years. They are full of invention and fancy and variety, but the prosaic impedimenta of probabilities are not always permitted to interfere with telling effects. Here is the plan of "Goosey, Goosey, Gander." One June evening little Dick is put to bed too early by a sister impatient to go out. His bedroom is under the roof, and there is an open scuttle through which he can look at the sky. Unable to go to sleep, the infant—who is apparently quite alone in the house—decides to get up. He climbs the ladder, gets out on the roof, walks across other roofs, and goes down somebody else's scuttle into a deserted garret. Here he amuses himself with rocking on an old rocking-horse. The sound of it makes an old man below start and say "Harry's horse ! but no"—or words to that effect. Then little Dick proceeds to another room, which is a deserted girl's-nursery, all the dolls and things having been kept where they were left, and being now covered with dust. In the opposite room the old man reads the letter of a penitent daughter, once the little girl owning the dolls, who now writes that her husband is dead and begs to be taken back home. A fair and a dark angel stand either side of him, one counselling forgiveness, the other hard-heartedness. They speak in alternate paragraphs a good while. Just as the old gentleman has decided for the dark angel, baby Dick strays in, the stern parent shrieks, totters forward, tumbles down-stairs, but isn't killed, Ellen is sent for, and all is right.

There is not oftener a handsomer Christmas book published than 'The Catskill Fairies.' The illustrations are uncommonly attractive, the designs being full of imagination and the drawing most careful and delicate. The title will perhaps prove a little misleading, as most readers are likely to expect from it something specially connected with the Catskills, possibly legends after the manner of Rip Van Winkle. They will be justly disappointed on finding nothing of the kind, but merely a series of ordinary fairy tales—pretty, fanciful, elaborate, but no wise unusual—which might as well have been associated with the Rocky Mountains, or the Alps, or any other "rising ground." The little Indian girl introduced in one story does not alter the case ; she might as easily have done what she did and been called a German peasant. The plan of the book, too, with such a wide range as the title implies, is singularly commonplace. Little Job, with his opportunities in the backwoods, might have met dozens of sprites and good-men face to face, whereas he is made to dream everything as any other child may do any night he chooses to combine a modern fairy-book and mince-pie before retiring. The same want of originality has made the stories themselves seem like the now too familiar class of current fairy literature. All the niceties are attended to ; the fairies are beautifully dressed in fresh designs of petals and flies' wings, etc. ; and all the other properties, though vamped up for the new season, are as easily recognized by us gaping and tired old folks. We must get our pleasure, therefore, from watching the delight which it can be safely predicted children will take in 'Catskill Fairies' in spite of our cynical exposure of it.

The last book on our list is designed for children of a somewhat larger growth than those who would appreciate the foregoing. The age at which they can be profitably instructed in wood-carving will vary, of course, with the mechanical aptitude in each case. What recommends this little manual beyond its clear and minute directions for the special operations of which it treats, is the incidental aid it gives to common carpentry. Not only does it abound throughout with ingenious suggestions which even the adult workman need not despise, but it gives in chap. viii. a narrative of Oriental achievement in turning in the open air "with a basket of tools and no lathe" which alone is worth the price of the book to a receptive young mind. The author dedicates his work to the "Boys of England," but he points out in the course of it that wood-carving is a very pretty and entirely practicable employment for girls as well as boys, and for young women as well as young men. In particular, as regards fret cutting and perforated carving, it "can be carried into the drawing-room. Numbers of ladies practise this beautiful art, and are really most skilful at it. One lady of my acquaintance is carving a set of chairs for her dining-room ; and a lady of my own family, at her first trial, fret-cut a bracket of a very complicated pattern, and executed it as well as if she had practised the art for years." Personally, Sir Thomas will be found a very pleasant acquaintance.

*India and its Native Princes:* Travels in Central India and in the Presidencies of Bombay and Bengal. By Louis Rousselet. Translated by Lieut.-Col. Buckle. (New York : Scribner, Armstrong & Co. 1876.)—Subscribers to the *Tour du Monde* three or four years ago congratulated themselves on the treasure which they had secured in the illustrations to M. Rousselet's 'L'Inde des Rajahs.' Not that the text was insignificant, but that, as often happens in the case of this periodical, it was overshadowed by the high quality of the engravings, as well as by the peculiar interest which the natural scenery, the temples, and the races of India must ever have for the Western mind. The translated work is, of course, of English manufacture, and is sumptuously printed and bound, making a quarto volume of 579 pages. M. Rousselet's journeying began in 1864, and was accomplished by all the prevailing modes of conveyance, including railway carriage, oddest of all being his experience with the Rajah of Punnah, with whom he "set out on a tiger and panther hunt in one of the wildest regions of India," drawn along by a road locomotive over a stuccoed sort of high-

'Doings of the Bodley Family in Town and Country, by the author of 'Stories from my Attic,' 'Dream Children,' and 'Seven Little People and their Friends.' With seventy-seven illustrations.' New York : Hurd & Houghton.

'Jolly Good Times ; or, Child Life on a Farm. By P. Thorne.' Boston : Roberts Bros. 1875.

'Nine Little Goslings. By Susan Coolidge.' Boston : Roberts Bros. 1875.

'The Catskill Fairies. By Virginia W. Johnson. Illustrated by Alfred Fredericks.' New York : Harper & Bros. 1876.

way made expressly for it. He had introductions to the first native circles, and was entertained with great magnificence at the court of the Guicowar of Baroda, not, as we make out, the corrupt and profligate ruler accused last year of an attempt to poison the British Resident, but the predecessor and very "moral" of him. M. Rousselet devotes a great many pages to the Guicowar's barbaric displays and barbarous amusements, his gladiatorial combats, etc., and is evidently under some constraint as a guest not to speak his mind about this Mahratta Cæsar. The title, by the way, of "Guicowar," on which the princes pride themselves, means, according to M. Rousselet, the "keeper of cows." Of dancing-girls and jugglers our traveller saw not a few, and of the latter he says that some of their most marvellous tricks—like the boy stabbed through and through under a basket, or the growing of a complete plant from a seed under a cloth—are explainable to Europeans, but he does not appear to have been initiated himself. A fakir whom he encountered had, besides a withered arm extended upwards (a result not accomplished by simple will-power), what was still more curious—a small myrtle-bush growing out of the hollow of his hand, which had been filled with earth.

After all and above all, one returns to the illustrations so profusely scattered through this elegant volume. M. Rousselet was a photographer, and by far the greater number of the engravings are made directly from views taken by himself. This gives an especial value to the figuring of architectural subjects and of the native inhabitants, whether of high or low degree. Nothing more admirable or more authentic has ever been done for India.

---

*The Border-lands of Insanity, and other allied Papers.* By Andrew Wynter, M.D., etc. (New York : G. P. Putnam's Sons. 1875.)—Dr. Wynter's essays, mainly occupied with reflections and anecdotes destined to show "how fine is the line which separates sanity from insanity," are (with the exception of one point) rather light in matter for a collection of reprints, though they doubtless did good service as articles in the reviews in which they appeared. The author writes an excellent style, and, although he offers little that is novel to those familiar with the literature of morbid psychology, his book may well serve to lure young readers into that more appetizing than satisfying field. The one point we excepted above from our accusation of lightness is Dr. Wynter's attack upon the present overgrown asylum system. We are convinced that reform is nowhere more called for, and we therefore gladly welcome any critic whose attacks are as well and forcibly directed as his. It is the harmless chronic lunatics "who now choke up the public asylums throughout the land, converting them from houses of cure into mere prisons."

"As the asylums are spreading in size, the very atmosphere within the walls may be said to be saturated with lunacy. They are becoming centres for the condensation and aggravation of the malady rather than places of cure, just as the crowding a fever hospital makes the type of disease more malignant. We are convinced that this is an evil that has been too much overlooked. The insane not only require more physical support than the sane to keep them from going back, but also more healthy mental stimulus; they cannot lean upon themselves without deteriorating. Hence the true principle of cure for the curable, and of support for the incurable, *is an association with healthy minds.*"

The author's remedy lies in *dissemination* of the chronic patients. As the whole matter is largely a question of public economy, for which it is necessary to enlist the interest of laymen in their quality of taxpayers, we do not scruple to express the hope that Dr. Wynter's little work will be widely read. He has little faith that the present generation of asylum officers, bred in a vicious tradition, will do much to help reform in England ; we wish we could feel more sanguine about the profession in this country.

---

*Deutsche Lyrik:* Selected and Arranged, with Notes and Literary Introduction, by C. A. Buchheim, Ph.D. (London and New York : Macmillan & Co. 1875.)—The present volume, which serves as a pendant to the well-known Clarendon Press Series of German Classics, can only confirm Professor Buchheim's reputation for scholarship and good taste. Like the wise householder spoken of in Scripture, the editor has brought forth from his treasury things new and old, and all of them good. An introduction of ten pages, temperate in tone, gives a suggestive résumé of German lyric poetry from Luther to the present day. The literary and grammatical notes at the end are extremely good, and cannot fail to be a decided help to both teacher and reader. Two alphabet indexes, one of the authors, the other of the separate pieces arranged by the initial lines, will facilitate reference. Concerning the character of the selection, we can scarcely venture upon a criticism. The reader may perhaps miss some old friends, but their places, he must admit, are taken by very acceptable strangers, who bid fair to become old friends in turn. The editor gives nothing weak or ignoble because it happens to be new, and is true to his title by keeping within the strict limits of *lyric* poetry. We have said that the grammatical notes are extremely good, but this will not debar us from saying that there are some which we believe might be made better. Thus, Luther's lines (in the first poem of all) :

"Für allen Freuden auf Erden
Kann niemand kein feiner werden,"

are simply translated : "Of all joys upon earth none can be more exquisite." This is no explanation ; no account is taken of *für* for *vor*, of the use of the double negation, or of the significance of *werden*. *Gesellen gut* (in the same piece) we do not regard as a mere "poetical inversion for *gute Gesellen*," but rather as a reminiscence of the mediæval syntax (M. H. G.), where the post-positive adjective had emphatic force. Much less can we regard *böser Mörd'* as dependent for its case upon the verb *verhindern*. This verb, it is true, occasionally governed in archaic construction the genitive ; but in the present instance the word *Mörd'* is evidently governed by *viel*. It rather surprises us that the editor, in giving Schlegel's lines on the structure of the sonnet, p. 119, should not have added those by Schiller on the so-called elegiac verse used so extensively by Goethe. The selections from Goethe, while they are all good, labor under one defect—they are too one-sided, most of them being love-songs. Now, although it is perfectly true that no poet, ancient or modern, ever sang of love in a more loving or more lovable strain than Goethe, this is far from being all. Goethe sang of many other things equally well. We regret that Professor Buchheim has not given more specimens of Goethe's satirical and reflective vein, for we fear that the reader may gain from the present collection an imperfect impression of the wonderful range of Goethe's faculties.

---

*Lincoln, Stanton, and Grant.* Historical Sketches by Major Evan Rowland Jones, United States Consul, Newcastle-upon-Tyne. (London : Frederic Warne & Co. New York : Scribner, Welford & Armstrong.)—It is not a very bold statement that one should speak respectfully of a respectable book, but, in these days of bookmaking without end, a reviewer may find growing upon him an impatience which makes it difficult for him to speak thus and only thus. After reading with attention the lives of Stanton and of Grant, which together make up more than three-quarters of Major Jones's book, we are forced to declare that it has no reason for existence, and to wonder that it found a publisher. Not that it is a bad book. In the first place, it is very handsome. Its large print, good paper, and liberal margins make it very tempting. It is fairly well written, its tone is good, and its creditable though not absolute accuracy shows that its author has been diligent in his collection of material, and painstaking in his use of it. But the fault of the book is that it adds literally nothing to what was known before upon the subjects of which it treats. After some reflection, we reach the conclusion that it came into being from the accident of its author's holding a consular position in England. There may be a demand for such a book in England, but there is no place for it here. It is without value for the American student, and not likely, in our judgment, to attract the general reader.

# The Nation.

*NEW YORK, THURSDAY, NOVEMBER 25, 1875.*

## The Week.

THE third-term project has made sufficient impression on the public mind to produce great sensitiveness with regard to all rumors pointing to contingencies which might make General Grant again a necessity to the Republican party, and turn away popular attention from the scandals of our internal administration. Accordingly, a remonstrance addressed to Spain about the treatment of American citizens in Cuba by Spanish courts-martial, was sufficient, in the early part of last week, to make a small sensation as an indication of possible trouble with Spain. In Europe, where the traditions of the slavery period of American foreign policy still survive, and where the American Government is still supposed to be constantly hankering for war with a view of "influencing votes," the news seems to have produced a genuine sensation. One of its oddest results was an offer from Don Carlos, by a formal despatch to his cousin, to suspend hostilities during the prospective conflict with the United States, and to join forces against the common enemy; the Carlists not only to charge themselves with the defence of a certain portion of the coast, but with the fitting out of privateers to operate on American commerce. The arrangement would have been a very convenient one for the Pretender, as it would have enabled him to withdraw with a show of credit from his present enterprise, which is, by the last accounts, in a hopeless condition. Nearly all his principal officers have retired into France or been killed, and the remnant of his forces is hardly likely to hold together through the winter. What the United States Government has demanded is, it appears, the proper execution of the Treaty of 1795, the seventh article of which provides that in all cases of the trial of the subjects of one party for offences committed within the jurisdiction of the other, the accused shall be allowed to employ such counsel as he pleases, and have free intercourse with him. The stipulation has been disregarded time and again by the Spaniards ever since the Cuban troubles began, and notably in the *Virginius* case.

The death of Mr. Wilson can hardly be called a surprise, for he had been notoriously broken-down in health for a number of years. The moral drawn from his career by the newspapers is generally the obvious one of the success which may be attained in the United States by assiduity and earnestness. Mr. Wilson, who began life as a cobbler, died a Vice-President of one of the most powerful countries of modern times, and this, too, not merely in spite of his obscure origin, but in defiance, too, of the traditional maxim of prudence which enjoins upon all who follow a trade to stick to it. Going to the Senate nearly at the same time with Mr. Sumner, and sent there by the same political forces, it is natural to attempt a parallel between the two careers, but beyond their both being anti-slavery senators absolutely devoted to the promotion of equal rights, there was hardly anything in common between them. The part Mr. Wilson played at Washington was that of a quiet, hard-working legislator, while Mr. Sumner's forte was obstruction and classic oratory. During the war Mr. Wilson earned the gratitude, we may say, of every soldier in the country by the warm interest he took in their welfare and comfort, at a time when politicians of the baser sort were doing what they could to make money out of the relations of the Government to the army. He was an indefatigable worker, and probably killed himself by overwork. He was of course no statesman, and, as in the case of many of the other leaders of the anti-slavery struggle, Fate has probably been kind in removing him from a field of active life in which questions had become prominent which he was unfitted either by taste or training to solve. His death makes the wide gulf between the old anti-slavery politics and those of the present period of economical and administrative discussion, of scandals and rings and reform movements, seem for the moment to gape wider than ever, as if to emphasize the impossibility of any ordinary politician bridging it over.

The removal of Mr. Grinnell, chief clerk in the Patent Office, by Mr. Zachariah Chandler, has caused quite a sensation at Washington and among the patent lawyers. Mr. Grinnell has been chief examiner for a number of years, and has filled the office—which is one of responsibility, and requires experience and education for the performance of its duties—with credit. He had, in fact, the reputation of being one of the most capable and exact officials in any department at Washington, and rose gradually to the position of chief clerk by his thorough knowledge of all the machinery of the Patent Office. He was one of those men of superior abilities and attainments and long standing in office whom it is surprising to find in the subordinate service of the Government, and who are kept there simply because their knowledge and experience are absolutely needed to keep the machinery from going to rack and ruin. He had, however, declined to pay political assessments, and the new Secretary of the Interior at once descended upon him. Ordinarily, a clerk not dismissed for bad conduct is entitled to resign, and has a month's leave of absence, but in this case Mr. Grinnell has been removed summarily, the Department treating a refusal to pay assessments as an offence against the Government or malfeasance in office. The man who is put in his place knows nothing about the business of the office, or, in other words, his only qualification is that he is willing to pay tribute.

It is speaking within bounds to say that this case justifies all that has been said and much more that has been imagined with regard to Chandler's appointment. The *World* has recently been making up the "record" of the President with regard to the civil service since he first came into office, and it is bad enough without this last bit of evidence, but with it it is almost startling. He first (1870) gives notice to the country that he is going to reform the civil service, and begs Congress to assist him; he next announces (1872) that "political assessments, as they are called, have been forbidden within the various departments"; in 1872, he is re-elected President. In 1874, he announces that, unless Congress provides some "positive legislation" on the subject, he will "abandon" the reform. Congress does not provide any positive legislation, but, a scandal in the Indian Department revealing for the fortieth time the rotten condition of the service, the President makes a "new deal," and puts into the office of Secretary a man who is the most notorious defender of the old system. This man's first act is to turn out his best subordinate as a punishment for not contributing money for "political assessments," and to make him, by the contemptuous manner in which the act is done, a "terrible example" to everybody in the employment of the Government. There may be no connection between this defiance to public opinion, decency, and consistency and the fact that a Republican convention, largely consisting of office-holders, will meet in a few months to nominate a President, or that General Grant is talked of by some of his friends as a candidate; but if there is not, there ought to be, and the public will believe, too, that there is, no matter what is told them.

The Internal Revenue report shows that of a total revenue of $288,000,000 the Government last year drew $110,000,000 from spirits and tobacco alone, and it is believed that the better enforcement of the law against illicit distillation will this year bring the yield of the whiskey-tax alone from $52,000,000 up to $60,000,000. We presume an improvement, though by no means so great a one, might be brought about in most other branches. There is certainly

not one in which the character and discipline of the collecting officers might not be changed for the better. There has been a steady falling-off in the customs duties since 1872, and they will probably not improve until better times have fully set in; but here, again, the expenses of collection might doubtless be decreased by greater efficiency and by the appearance of a President with nerve enough to compel the Custom-House officials to abstain from local politics.

The Whiskey Ring prosecutions seem to be going on swimmingly, the proceedings against McDonald having already resulted in his conviction. The evidence is, or ought to be to the right-minded, very melancholy reading, which even the impudence of the convicted scarcely serves to lighten. In this way nothing could surpass the speech of Joyce, which has been going the rounds of the papers. Joyce, being convicted, obtained permission to say something in exculpation, and immediately proceeded to make a stump-speech of the most flowery kind, denying his guilt, denouncing his enemies, comparing the reform movement to an "epidemic" which has "risen like the mist of a mighty flood," and is speeding onward to "the gulf of punishment"; declaring that "the good and bad suffer alike," and that "many young oaks and tall sycamores on the banks are loosened from their firm foundation and dashed into the river of destruction"; but comforting his hearers with the reflection that "the flood even now is settling into its former bed, where the crystal waters shall again reflect the green foliage, the oak, and the sycamore, and the gentle breezes and birds of spring shall make merry music in the cathedral aisles of a generous nation." He also compared his case to those of Galileo, Columbus, Tasso, and Napoleon, and on sitting down was sentenced by the judge to three years and a half in the Missouri penitentiary. One witness, by the way, swore that Joyce told him he had bribed Mr. Wm. M. Grosvenor, the editor of the *Democrat*, to "let up" on somebody. Mr. Grosvenor denies this, and says that the transaction was simply a loan. The charge shows, nevertheless, how dangerous it is for reformers to have financial transactions with members of rings or "whiskey thieves" or "canal thieves," or any other kind of thieves.

The latest judicial scandal is the most curious of any. Judge Van Brunt, an able and respected member of the New York Court of Common Pleas, was some time ago fascinated on a trip to Europe by a lady, with whom he subsequently travelled and came to like so well that he returned home disgusted with his lawful wife, whom he persuaded into procuring a collusive divorce, the evidence for which he himself supplied. The divorce was granted, with the usual prohibition in the decree against his marrying again in his wife's lifetime, he being the guilty party. He thereupon returned to Europe, rejoined his new flame, and, it is now reported, has married her, in contempt of his court. The validity of this second marriage in this State raises, we believe, some nice points of law, on which we shall not touch. The most interesting feature of the case to the general public is the illustration it supplies of the need of a provision such as exists in the English Divorce Act, charging a Government lawyer (the Queen's Proctor was his old title) with the duty of keeping a lookout for all signs of collusion between the parties, and intervening if he has reason to suspect it. Without some such machinery, the law as at present administered in this State practically provides for divorce in all cases in which either party is willing to admit the commission of one of the requisite offences, and allows a wife to be coerced into divorcing herself for reasons which she would be only too glad to overlook, or in the existence of which she does not believe. It now appears that Judge Van Brunt has no present intention of returning to this country, and is willing to abandon his seat on the bench. The case is, we presume, without exact precedent, and supplies one more example, and a conspicuous and striking one, of the explosive force of the sexual passion, and of the dangers with which it constantly menaces society, even under the most powerful restraints. The amount of misery and demoralization, and the loss of confidence in character, which even one such escapade as this diffuses, is simply incalculable. It does not appear in the courts or newspapers, but wise men think of it.

General trade during the week has been of fair volume and good for the season. Demand loans continue easily obtainable at 4 to 5 per cent. The New York banks still have resting with them large balances belonging, for the most part, to the pork-packing trade, which is restricted this season by reason of the high price of corn and the consequent high price of hogs. All the currency wanted from here to pay farmers in the West for grain has been sent. More may be needed by the cotton States, the movement of cotton continuing active. The gold and foreign exchange markets have been higher than during the preceding week—gold less from commercial than political reasons. The belief that the talk about war with Spain was for the purpose of promoting a speculation in gold has appeared plausible to those who have closely watched the gold market. In London there has been a further advance in the price of such unquestioned securities as British consols and United States bonds; the Bank of England on Thursday reduced its discount rate to 3 per cent., and the "open market" has fallen to 2½ per cent. The same lack of confidence which has been the chief characteristic of our markets here for the past two years shows itself in London, and "money is easy" chiefly on this account. At the Stock Exchange here speculation has been tame, notwithstanding which prices have slightly advanced. Greenbacks during the week have ranged (for $100) between $86 95 and $87 62 gold.

The *Anglo-American Times*, a very good paper published in London, has in the number received by the last mail an article, almost ecstatical in its tone, entitled "Colonel John W. Forney and the United States Centennial Exhibition," in which the writer gives way to the most extraordinary rejoicings over the appearance of the Colonel in England as American "International Commissioner to Europe." We wish we had space to quote some of his dithyrambs over this auspicious event. They would greatly amuse some of our readers. We are sorry, however, to have to make known the fact to the *Anglo-American Times*, and to our English readers, that the despatching of the Colonel in an official character is looked upon by the best portion of this country as an unpardonable indiscretion on the part of the Centennial Commissioners, and as a striking illustration of the disregard even of appearances which familiarity with corruption has bred even in men who are themselves honest. Twenty-five thousand dollars of the Pacific Mail corruption fund were traced to the Colonel's capacious pockets in the Congressional investigation last winter, but he has never given himself the trouble to notice the charge, and his failure to meet it ought of course to have disqualified him for any place of dignity or emolument, and, above all, for that of an International Commissioner. Nor is this the first case of the kind in which the Colonel has been implicated and exposed; in fact, we believe it is the third. He certainly got $4,000 of the money of the Georgia Ring, headed by Bullock, when they were trying to get Congress to set aside the State constitution, in order to enable them to continue their game of fraud, before Bullock's flight from justice. It is, indeed, almost a matter of public notoriety that the Colonel has had a hand in most of the great Washington jobs, and his European mission is therefore a national disgrace for which the Centennial Commissioners owe an apology, not only to the public but even to the Indian Ring. When the Colonel lifted up his tuneful voice in London, a few weeks ago, in "vindication" of General Schenck, many honest Americans laughed through their tears, because there is a point at which rascality becomes funny.

One or two stormy meetings of the Emma Mine stockholders have been held in London, and some of the accounts of the concern have been published. The solicitors of the company seem to have gone to work thoroughly, and the secretary reports that the information conveyed in the accounts "has been obtained from each individual on oath and from the signed depositions of each party

referred to." The figures bear out all that has been said of the way that the shares were put on to the London market. It appears that each of the original English directors received qualifying shares from Baron Grant. Grant himself or the firm of Grant Brothers received £100,000 from Park, and nearly £100,000 more were paid to various persons to float the company or to keep it up after it showed signs of sinking. Brydges Williams, who was sent out here to visit the mine, and who made a flourishing report on the subject, and who, it is said—and indeed the facts pretty conclusively prove—knows nothing about mining, got for his trouble £5,000, and General Schenck was lent £10,000 by Park to enable him to purchase shares, he receiving from Park a secret written guarantee of eighteen per cent. This information was received by the stockholders with great delight, and all the directors were immediately "allowed" to resign. The announcement of the determination to prosecute both Park and Grant and "several others" was received with great applause.

The Berlin correspondent of the London *Times* draws a somewhat dismal picture of the commercial outlook in Prussia during the coming winter. Prices are high, business dull and declining, failures numerous, and money under the new banking law very tight, and the number of the unemployed large and increasing. As this comes close on the receipt of $400,000,000 in hard cash from France, it furnishes one of the happiest illustrations on record of one of the truths which sensible men are just now trying to hammer into the heads of the inflationists, viz., that supplies of money which are not drawn to a country by the legitimate demands of trade are sure, sooner or later, to work mischief. The money of the world has been well compared to a great ocean, with the various civilized nations lying along its borders, and with tides which ebb and flow in any particular place under the influence of an increase or diminution of business. If a particular community wishes greatly to sell, in it rushes to enable them to do so; if they greatly wish to buy, off it goes to the place where they desire to make their purchases; and the whole process, if not interfered with by crazy legislation, goes on with as much certainty as the rise and fall of the sea under the attraction of the moon. But the minute, through any agency whatever, money is forced on a community in which trade has not called for it, or in greater quantity than trade has called for it—whether it be gold or silver or greenbacks or three-sixty-fives—a state of disease is established which sooner or later brings on a collapse. When an inflationist therefore says that specie has not prevented trouble in Prussia, he furnishes a new proof of his folly or ignorance; but he is very angry when you call him foolish or ignorant, just as the Chinaman is if you laugh when he is beating a gong to get the dragon to stop eclipsing the sun. When you tell the Chinaman that he can't interfere with an eclipse, he replies, as the inflationist does, that this is *your* opinion, but that many thinkers of his acquaintance hold a different one; that there are astronomers in China as well as in Europe or America; that a little more modesty would well become you; and that your arrogance is intolerable; your astronomical notions have probably been put into your head by persons anxious to injure the gong business; and that there is not a province in the country in which the people would not give heavy majorities in favor of the gong theory of eclipses.

Russia is just passing through her first commercial panic, and the mere fact that she is capable of such an experience shows a great advance in material civilization, as it proves the growth and existence of credit. It has been begun by the failure of a noted German speculator named Dr. Strousberg, a man of the Jay Cooke or Jay Gould type—we do not exactly know to which he approaches more closely—who had enormous estates in Germany, Poland, and Bohemia, besides iron-works and car-factories in which he employed thousands of men. His liabilities are estimated in all at about $10,000,000, and his assets consist of $40 in cash and some household furniture, showing what would be considered over here unusual want of consideration for his creditors. He owed the Commerce and Loan Bank of Moscow so large a sum that his failure caused it to stop payment, and this caused a run on the other Russian banks—that on the Bank of Azov-Don in Taganrog and on the Moscow Merchants' Bank being, we are told, "on the American model." The Government has, however, arrested the panic by promising help by an issue of "the reserve," which we trust is not in irredeemable paper; but the crisis, as the London *Economist* points out, is serious, owing to the fact that the Russian banks are not over ten or twelve years old, and the whole system of credit which they create is therefore new to the country and imperfectly understood, and there is danger that the people, having once learnt the great American art of "making a run" on a moneyed corporation, may resort to it too frequently. How rapid the growth of the Russian banking business has been may be inferred from the fact that the total capital of the banks already exceeds $60,000,000. The Strousberg failure falls most heavily on Germany, where he owes over $5,000,000.

The Turkish bondholders, both of the earliest borrowing period and of 1858 and 1871, have waited on Lord Derby to solicit the help of the Government, but he has given them no hope of anything whatever except a good word whenever it shall seem to the Government it may be spoken judiciously; and as it now begins to be somewhat clear that even the other half of the coupons will not be paid in January, the situation seems desperate. It is aggravated, if aggravation be possible, by a sudden change of attitude on the part of Russia, brought about apparently by the repudiation; the official organs at St. Petersburg having abandoned their position of neutrality and abstention on the Herzegovina matter, and returned to the old one of active sympathy with the Christian population. They doubt the possibility of any reform being carried out, while giving the Sultan credit for good intentions, and use language which evidently points to the setting up of some form of purely Christian government in the disturbed provinces, and the renewal of the old policy of pressing the Turks back towards Asia. What Austria and Prussia will do is not yet known, but there is every likelihood that the non-payment of the January coupons will be followed by some decisive step, and it is increased by the news, probably true, of insurgent successes.

The drift in Turkish affairs points more clearly than ever towards intervention in some form. Russia seems to be really bent on bringing it about, and has it in her power to force joint intervention by threatening to interfere alone. Public opinion in England seems to be preparing for an Austrian protectorate of Herzegovina, at least, and, if there is any more positive step taken, to put the whole Ottoman Empire into the hands of trustees for the occupation of Egypt as a matter of safety with regard to India. Things are likely to be brought to a crisis as far as England is concerned by the financial situation. England and France jointly guaranteed a Turkish loan of $25,000,000 in 1854, which was to be secured by the whole revenues of the empire and by whatever remained of the Egyptian tribute after paying the interest on another loan previously contracted the same year. No default has as yet been made on the former loan, but there appears every reason to expect one; and in the new financial scheme of the Grand Vizier, no priority is assigned to this over any other item in the debt as a lien on the revenues. Whenever he fails to pay the interest, therefore, the English taxpayer will be called on for half of it, and then assuredly there will be a great outcry, and he will demand "something to show for his money." The financial circulars of the Turkish Government, in the meantime, continue to be very entertaining, owing to their tone of rigid commercial prudence and probity. They point out to the creditors in austere language the terrible consequences that would have resulted from paying the full interest any longer, and, while ignoring the outlay on palaces and iron-clads, talk of the existing embarrassments as if they were the result of a hail-storm or a bad harvest.

## THE BARBARISM AT ST. LOUIS.

THERE could hardly be more instructive reading at the present moment than the evidence in the whiskey trials at St. Louis. We do not propose to analyze it or comment on it in detail. Indeed, there is very little that is interesting in the cases of the individual defendants. There is nothing surprising or even impressive in their career. Neither they nor the distillers they preyed upon supply a single great moral catastrophe. One of the party, the ex-Supervisor McDonald, who has just been convicted, had so bad a character before his appointment that the two senators from Missouri, Messrs. Drake and Schurz, went to Mr. Boutwell to remonstrate or protest, as the case might require. He received their communications with calmness, and was not prepared to deny their truth, but declared that the nomination was inevitable, and apparently threw the responsibility on a higher power than himself. What followed has, therefore, no great moral lesson in it. The Government officers not only did not repress illicit distillation, but they made arrangements for it on a great scale. They stimulated the production of illicit whiskey by every means in their power, and collected princely revenues for themselves in the way of bribes. The honest distillers, finding they could not compete with the manufacturers of "crooked whiskey," were one by one either driven out of the market or forced to engage in the game of fraud. The gang had their confederates in Washington, who gave them early notice of the occurrence of anything likely to lead to their detection. As usual, too, the need of "the folks in Washington" for campaign funds furnished a frequent excuse for increasing the amounts of money extorted from the distillers, and the whole process was marked, of course, by every variety of fraud and falsehood at every step. A more shocking picture of morals and manners than that painted by the evidence, among men occupying positions of at least commercial prominence, could hardly be laid before the public. But then its lesson is political mainly. The immediate gain the Government is likely to make by these proceedings is estimated, at the outside, at about $1,200,000 a year, or about a single day's total revenue, which is doing very well; but it cannot be said that the pecuniary result of the attack on the Ring is likely to be very valuable. Indeed, if its pecuniary results were the only ones, few people would say it was worth making. We doubt very much indeed whether, if it is not to lead to very permanent reform, the money will compensate us for the publication of a scandal reflecting so much discredit on our institutions. But to secure through it any permanent reform, its lessons must be understood and laid to heart by the community.

It will not do to ascribe what has occurred in St. Louis to any peculiar baseness on the part of either the revenue officers or the distillers engaged in the frauds. They are, as regards character, probably quite up to the average of men in similar positions throughout the country. The distillers probably had the average morality of business men, and the revenue officers are persons of the sort ordinarily selected for their duties, and they were selected by the same process and under the same guarantees as to fitness as revenue officers in other parts of the country. The frauds have been due rather to the peculiar temptations of the whiskey manufacture than to any particular moral weakness on the part of those engaged in them. The civil service broke down more disgracefully at St. Louis than elsewhere, not because it was weaker there, but because it was exposed to a greater strain. The attack on the Ring alone, therefore, will not strengthen the service: it will simply temporarily remove the pressure on it at that particular point. The temptation will remain the same; and when new men are exposed to it, and the terror inspired by the present suits has passed away, they too will probably succumb, though perhaps with less recklessness. If, therefore, the success of the present "raid" should in any way increase the indifference of the public to the need of a thorough change in the mode of selecting and employing revenue officers, it will do harm and not good.

It must be observed, also, that the present vigor of the Government does not point to any permanent change in its methods of discipline. It is, on the contrary, largely the result of an accident. It is an accident, for instance, that a newspaper editor watched the conspirators and informed on them. It was also an accident that a man like Mr. Bristow was in the Treasury. He was not selected for that place on any fixed principle. He fills it because the President happened to take a fancy to him. Luckily, he is a good man for the place—a man who, though not an experienced financier, brings an excellent mind to questions of finance, and who, though not an experienced administrator, brings to the work of administration great vigor and perfect courage and integrity. When, therefore, he was put on the track of these frauds, he followed them up with remorseless severity; but it is safe to say that neither of his predecessors would have done so, and we have no good reason for expecting, with any great confidence, that his successors would do so. The Treasury was the fountain-head of some very bad frauds and abuses under both Mr. Boutwell and Mr. Richardson, but neither of these gentlemen felt called on to pursue them. On the contrary, the exposures were made by Congress, and the Secretaries had so little stomach or capacity for the work of reform that they had to abandon their posts. With the present civil service, therefore, the presence even of an unusually able and upright Secretary promises us no permanent safeguard against even gross corruption. If Mr. Bristow were to resign to-morrow, the old evils might spring up with renewed activity. How little sense of personal security we can derive from the possession of a good officer at the head of a department is well shown by the appointment of Mr. Chandler as the successor of Mr. Delano. Appointments which are the result of personal fancy, indeed, remind one of the methods of Oriental despots. The divan of Solyman or Haroun-al-Raschid was filled with the monarch's personal favorites, and when the Vizier was dismissed, or had his head cut off, the court-barber had as good a chance of the vacant place as the oldest statesman in the empire. Let us say, too, in all seriousness, that the purification of the civil service by "raids" and "assaults" is a thoroughly Oriental process. It has always been the custom of Eastern monarchies to bestow the offices of the government as evidences of the ruler's personal gratitude or affection, and not of his zeal for the welfare of the taxpayers; and then, when the abuses bred by this system in any particular district had become unbearable, to send down emissaries to despatch the chief offender with the sword or the bowstring. The proceedings at St. Louis are an exact copy of this method, with the modifications introduced by the greater mildness of our manners. Instead of strangling our peculators, we send them to the penitentiary. A curious illustration of a sort of subconsciousness of the Oriental analogy is furnished by our adoption of the phrase "decapitation" as a synonym for dismissal from office.

The civilized and scientific mode of maintaining the efficiency of a government service is so different both from the Oriental despotic mode and from ours, that the failure of the most progressive of Western communities to insist on its adoption, and to refuse to rely wholly on "raids" and "decapitation," is perhaps one of the most curious facts of the hundredth year of the national existence. It actually shows that in the work of administration, which is one of the prominent tests of civilization, we have retrograded towards barbarism, and are gradually getting back to a level with Turkey and Afghanistan. The modern scientific method, which is in use in all other first-class Christian states, is to organize the civil service on principles of human nature, and secure honesty and efficiency by diminishing temptation and stimulating hope, instead of relying, in Oriental fashion, on the brute terror caused by occasional applications of the halter and the knife. That is to say, they recognize the value of character, and employ men who, by having behaved well under observation for a long time, show that they are likely to behave well in future; they recognize the weakness of the best men by shielding them as much as possible against temptation, by the provision of careful checks, by the payment of good salaries, or giving the equivalent of good salaries in the shape of security of tenure or social consideration.

In other words, they conduct their business as civilized merchants and bankers conduct it and know that it is necessary to conduct it in order to avoid bankruptcy. If, therefore, public opinion were in a healthy state on this subject, the St. Louis affair would fill us all with shame instead of rejoicing, and the newspapers, instead of congratulating Mr. Bristow, would be filled with expressions of sympathy and regret at seeing him—an able and enlightened modern gentleman—compelled to use in the performance of his duty the machinery which was employed by Tamerlane and Jenghis Khan, and which has long ago been discarded by Christian statesmen.

## THE CUBAN SCARE AND THE PRESS.

THE discussion in the English and American papers of the supposed "note" addressed by the United States to Spain on the Cuban question, will not be likely to strengthen the hands of those who believe we are about entering upon an era of "government by newspaper." It is, for instance, impossible to read the articles which have appeared in London on the subject, dwelling as they do on the unwonted insolence of the demands made on Spain, the tone of haughty arrogance displayed by the "note," the traditional pride of Spain, etc., etc., without noticing a kind of exultation in the prospect of a "difficulty" between Spain and the United States which sadly mars the general tone of the journalistic verdict. We know, of course, on this side of the Atlantic what this feeling really is; every American journalist knows what anxiety is from time to time caused in his own mind by the dread of a "general European war," and how strenuously he endeavors from week to week, and from month to month, to arouse Europe to the dangers which beset her tottering principalities from the military ambition of France, the "earth-hunger" of Germany, or the "manifest destiny" of Russia, and how willingly he unmasks from time to time the combinations and alliances which the unprincipled kings and emperors are getting up among themselves with a view to war. There is an old story, which is supposed to burlesque their philanthropic efforts, of a leading newspaper whose managing editor reserves as one of his standing topics for weekly editorial discussion the "prospect of a general war in Europe," and we believe most people who have noticed the complete manner in which some of the best-laid plans of Bismarck, Thiers, and Gortchakoff for "internecine warfare" have been exposed and foiled by the efforts of the press of this city, will agree with us that there is not much burlesque in the story. We cannot, therefore, complain of the English newspapers for doing their utmost, too, to avert bloodshed in the New World by exposing from time to time the dangers of a "war with Spain." Indeed, the horror of bloodshed displayed by the English press during our Rebellion, and its manly efforts to prevent the catastrophe of a war with Spain, may fairly be set off against our own sadness and gloom at the prospect of a general war on the other side.

The Cuban scare is really a renewed illustration of the duty of journalistic calmness in a time of excitement. The prevailing theory is, we are aware, quite the opposite. According to this, it is the duty of the editor, as soon as he hears of a "crisis" or an "exciting" or "disquieting" rumor of any kind, first to excite and disquiet himself as much as possible, and then to proceed, by means of sensational head-lines and leads, to excite and disquiet his fellow-citizens as much as possible. Now, there is no branch of politics in which he can do this with less safety than in that of foreign relations, and no country whose foreign relations it is less safe to make the attempt with than the United States. We have had sad and mortifying proofs of this before now, in the *Trent* affair and the *Virginius* case. In the former, there can be little question that if it had led to a war with England the press would have been morally responsible for the result; for in the critical condition of the public mind with regard to the surrender of Mason and Slidell, the burden of responsibility fell upon those who undertook to advise the public as to its rights and duties, and this is the function undertaken by the press in civilized countries. Instead of examining the question in a calm and judicial spirit, the press refused to discuss it at all, and did its best to hound the Government into a suicidal war with England. Again, in the case of the *Virginius*, a well-known Cuban vessel—engaged, according to common opinion, in violating the law of the United States, and keeping up a system of piratical descents upon a friendly state from our shores—was captured, and it turned out that she had at the time been fraudulently flying the American flag. The newspapers immediately declared that the American flag had been insulted, demanded the surrender of the vessel, and threatened Spain with a bloody revenge. A few months later it was ascertained that the vessel had no right to an American register, and that we should have to dispense with the salute we had stipulated for as an amends to our wounded honor. The present Cuban scare is even more remarkable than the *Virginius* embroglio, for in that case there were at least some very high-handed proceedings on the part of the Spanish authorities to complain of; but on this occasion the scare has been managed from beginning to end as a strictly journalistic matter. Neither Spain nor the United States seems to have taken part in it, and the whole thing grew out of a letter of instructions given to Mr. Caleb Cushing by Mr. Fish, printed and discussed a year ago by all the newspapers. The only question which Spain and the United States have been discussing has apparently been the right, under the Treaty of 1795, of American citizens, tried by Spanish tribunals, to have counsel—a question the settlement of which, no doubt, was made necessary by the *Virginius* case.

There is one thing that the English press in all its discussions of Spanish-American relations seems determined to overlook, and that is the radical distinction between the relations of powers like the United States to a power like Spain and those existing between first-class European powers. It generally assumes that these relations are the same as between two first-class European powers—Germany and England, for instance, or Austria and France. They are, therefore, always surprised and alarmed at the tone taken by the Government of the United States towards Spain, and generally take pains to intimate that the United States would not address language of this sort to England unless it was ready to go to war. When they find Mr. Fish saying, as he did in his note published a year ago, that "the desire of independence on the part of the Cubans is a natural and legitimate aspiration," inasmuch as they are Americans and not Spaniards; reminding Mr. Cushing that it has long been seen that Cuba must become one of the family of American republics—that the independence of the island is "the manifest exigency of the political interests of the Cubans themselves," and "equally so that of the rest of America, including the United States"; declaring it impossible to doubt that "the ultimate issue of events in Cuba will be its independence, however that issue may be produced, whether by means of negotiation, or as the result of military operations, or of one of those unexpected events which so frequently determine the fate of nations"; and assuring Mr. Cushing that the policy of the United States with reference to Cuba is merely one of "expectancy," but "with positive and fixed convictions as to the duty of the United States when the time or emergency of action shall arise"—when they read these minatory prophecies, they are startled at the openness of the threats, and warn both countries to prepare at once for a bloody struggle. The papers are particularly fond of reminding us of the "haughty pride of the hidalgo," and the unfamiliarity of his ears with intimidating sounds. The fact is, however, that the hidalgo, however haughty he may be, has been accustomed to this sort of intimidation from the days of the Ostend Manifesto down to the present time; and when Mr. Fish talks to him of the attitude of the United States being one of "expectancy," and the destiny of Cuba being to form one of the great body of American republics, he hears what he has always heard for a generation, and is quite accustomed to putting up with. There cannot be said either to be anything very shocking or wrong in it. The reason why the blustering language formerly used to Spain by the United States in the old Democratic days was

disapproved by the majority of mankind, was not because it treated Spain as an inferior power, but because the great majority of civilized people disapproved of the object for which it was used—the annexation of Cuba as a slave State. The legitimate objects of the Government now, and the only objects for which diplomatic pressure has been brought to bear, have been either the protection of American citizens or the cessation of a perfectly barbarous and wasteful guerilla warfare—if warfare it can be called—both praiseworthy objects, provided they are honestly adhered to, and not made use of for electioneering purposes. The only question remaining, then, is whether the United States is entitled, in furthering these objects, to use such language as we have quoted from Mr. Fish's circular or not. There is no abstract international etiquette laid down by Wheaton or Grotius as to the proper language to be used in diplomatic intercourse, except between states which are really equals; and in the case of states really equal, no such language as we have been in the habit of using would ever have been allowed or possible. But Spain is not in the position of an equal, and there would be neither sense nor kindness in being too polite to her. Spain is a bankrupt, semi-civilized, superstitious, and stationary country, unable to govern itself, and devoured by civil war. No European power treats Spain, in fact, with punctilio, and even the language used in our diplomacy cannot compare with the proposal openly made by Germany a few years since, to police Spanish waters with the German navy.

There is really, in the circumstances of the case, so little reason for any Administration at the present time to have the faintest desire to go to war with Spain, that the suggestion looks on its face like a poor joke. Annexation ceased to be a possible policy with the destruction of slavery. A protectorate would involve us in needless expense, and must end in annexation. The island is Spain's most valuable possession, and would not be likely to be given away; and there is probably less military ambition in the American people at the present time, less desire for an "extension of the area of freedom," than for any previous time in the last fifty years. The only strictly military class ever produced in this country, outside the army and navy, were the old "fire-eaters" and filibusters, and they were produced by slavery. Finally, the Administration is not warlike, and, even if it were, it could, in the face of a bitterly hostile House of Representatives, do nothing. A "war with Spain" would therefore be an impossibility were it not for one thing—the fondness of the press for sensations and scares; and the ludicrous termination of the present discussion of the Spanish "note" will not, we hope, blind us to the danger of journalistic enterprise in matters of this kind. It is a gratifying sign of the improvement in the tone of newspaper discussion in this country that on this occasion the "scare" has been foreign rather than domestic.

## THE ARRANGEMENT OF GREAT EXHIBITIONS.

DR. H. SCHWARZ, professor of chemical technology at Gratz, in Styria, has submitted to our consideration certain rules and principles which should govern the subdivision of space and grouping of objects at future exhibitions. His views, evidently based upon careful observations made at Vienna, are characterized by a spirit of fairness and by the desire to bring the educational *moment* of such exhibitions into its rightful prominence. We shall endeavor to reproduce them with as much fulness as our limited space will permit, giving at the same time the reasons which lead us to withhold our assent.

The conclusions at which Dr. Schwarz has arrived are three in number: one is of a negative nature, two are positive. The negative conclusion is that the practice of subdividing space according to nationalities should be abandoned altogether. The progress has been hitherto from municipal to provincial, from provincial to national, from national to international exhibitions. It is now time, our author thinks, to take one more step by instituting what he calls an "anational" exhibition—that is to say, such an exhibition as shall afford to the individual man an opportunity of perceiving what mankind at large, irrespective of territorial distinctions, has effected in utilizing the materials and forces of nature. This substitution of the anational for the international idea will not only facilitate scientific study, but will also, it is thought, help to put an end to the bickerings and jealousies that are apt to arise among detached international commissions. The two positive conclusions are: first, that the space allowed to each class of objects, and to each nation in that class, should be measured by the value which that class and nation represent in the trade of the world; second, that the classes of objects should be grouped in sectors of a circle.

The significance of the first conclusion can be made evident by a concrete example. Let us assume—for the purposes of illustration—that the total area of an exhibition is 2,000,000 square feet; that the total value of the yearly products of the world's industry is $20,000,000,000; and that in this total the iron industry is represented by $1,000,000,000. It results from this that the space to be assigned to the exhibition of iron is 100,000 square feet. Proceeding in the computation, let us assume that the total of $1,000,000,000 for the iron trade is made up of $300,000,000 for England, $150,000,000 for France, Germany, and the United States each, and $250,000,000 for the rest of the world. England, then, would have as her share of space for her iron trade 30,000 square feet, Germany, France, and the United States would have each 15,000, and the remaining 25,000 square feet would be divided among the other nations. Dr. Schwarz maintains that the adoption of some such principle as that embodied in the above example is the only way of doing justice to exhibitors. Heretofore the assignment of space has been, to say the least, arbitrary. One exhibitor who happened to put in his claim before another, or who could bring more influence to bear in his favor, received the lion's share and the best position. This evil was too glaring at Vienna to escape the attention even of the most unobservant. One might perceive there a petty dealer in meerschaum pipes or Russia-leather portemonnaies occupying a far more conspicuous position than a manufacturer representing millions of capital and hundreds of workmen.

Dr. Schwarz's method of arrangement also needs fuller explanation. The centre or core of the circle is to be assigned to the department of education, because this is the basis and starting-point of all man's power over the material world. From this centre radiate the several sectors. Each sector is to comprise some one of the great groups of materials upon which man exercises his powers. Thus, one sector for minerals, another for ores, a third for salts, a fourth for fuels, a fifth for foods, a sixth for articles of clothing, etc. In each sector the objects are to be arranged in progressive order, the raw materials being nearer the core, the more finished products towards the circumference. If around the circle thus subdivided we draw a still larger circle, this outer ring will afford the room for machinery.

We have given little more than the bare outlines of a plan which Dr. Schwarz has elaborated quite in detail. Still, even these outlines will reveal sufficiently his purpose and the motive by which he has been governed. The object is indeed praiseworthy, and if we could only bring ourselves to believe that it was attainable we should not hesitate to give it our countenance. But the doubts that immediately suggest themselves are too numerous and too strong to be suppressed.

In the first place, we fear that Dr. Schwarz has overlooked one potent factor in all exhibitions, to wit, the motive that prompts the individual exhibitor to send his goods. This motive is not patriotism, much less the unselfish desire to instruct mankind in general. To be as brief and explicit as possible, we assert that the motive is the very selfish and ignoble desire to make money. The manufacturer of iron or sugar, the wool-spinner, the dealer in silks or bronzes, sends his iron or sugar, his woollens, silks, or bronzes, not that the tourist and man of science may make comparative studies, but that he, the manufacturer, may sell his goods or at least obtain orders. The key-note of all exhibitions, whether provincial, national, or international, whether at London, Paris, or Vienna, has been business. It is the expectation of increasing his business that induces the manufacturer or trader to go to the expense and annoyance of sending his goods hundreds and thousands of miles. To eliminate this element of money-making, to intimate in advance to exhibitors that their demands for space and their employment of handsome show-cases and other attractions must be squared to the ideal of a lesson in science, would be nipping the enterprise in the bud.

In the next place, we think that Dr. Schwarz sets an erroneous value upon this scientific teaching itself. Not that we regard a *coup d'œil* of the world's industry, properly classified and proportioned, as a thing of little value. On the contrary, were it a demonstrated possibility, we should welcome it as one of the greatest lessons of life. But the time has not come, and probably never will come, when a world's-fair can be used as the stage for such a *coup d'œil*. A world's-fair is only a vanity-fair, a jumble of good and bad, of wisdom and folly. Those who go to it are for the most part sight-seers. For one who visited Paris or Vienna with the steadfast purpose of study, one hundred came with no object in view beyond the gratification

of their curiosity, no expectation save that of making a stray bargain. Yet it is the hundred aimless tourists, in distinction from the one student, who support the exhibition, and it is for them, for their convenience and pleasure, that the exhibition must be planned. They do not look for a strictly scientific arrangement; in fact, they would be rather disconcerted and puzzled by it. Their chief concern is that the several objects and show-cases shall be easy of access, and that each case shall have its showman, ready to sell or to give information. In this very matter of showmen, the Germans at Vienna made, we think, a serious and to them costly blunder. Their arrangement was, in general, excellent—far better than that of most other nations. Articles of the same kind were carefully grouped, not infrequently in joint cases. There was more method, more science, if the reader will, in their department than in that of the French. Yet the French sold two or three times as much. The result was due in part, doubtless, to the attractiveness of the French goods, but it was also due largely to the circumstance that the French exerted themselves to sell, while the Germans did not. The Germans seemed to be "organized" out of all sense of individual enterprise. Case after case bore the placard: "For information, apply to the Office of the German Commission, No. —." We doubt if one in ten of the visitors who really wished to buy or to obtain information took the trouble of walking a quarter or half a mile to the German Commission's office.

Besides, it is not altogether evident to us that a grouping by nationalities is undesirable. The so-called geographical arrangement adopted at Vienna was unquestionably a failure. It was, in both the English and the German sense of the term, "fatal" to the last degree. Each nation stood by itself, and the great exhibition was little else than a string of little exhibitions. One who wished to compare English and Japanese porcelain, for instance, was compelled to walk the entire length of a building over three thousand feet long, because the English department was at one end and the Japanese at the other. But the "anational" arrangement advocated by Dr. Schwarz seems to us a move to the opposite extreme. We do not believe that mankind is ready yet to be denationalized. Even if the several governments entering into an international exhibition could be led to waive their claims for separate representation, such a denationalization would be attended with assuredly one evil consequence. Each visitor brings with him a certain amount of national preferences and prejudices. If he does not succeed in shaking them off and learning to look at the efforts of other nations in a more liberal and enlightened spirit, he fails to learn the first and perhaps the only lesson that an international exhibition can give him. Yet he undoubtedly will fail to learn it unless it be made easy for him, unless he be enabled to take in at a glance the entirety of products exhibited by his own country and compare it with the entirety of some other country. Such a comparison, crude and superficial as it may be, is still a gain, and a gain which every one can make for himself. Whereas the anational plan, by arranging all the products of the world according to certain principles familiar only to the professed technologist, would deprive the layman of his only basis and object of comparison. Now, as we have stated before, there are one hundred laymen for one technologist, and each one of these hundred laymen would like to see how his country as a whole, not in its iron industry alone or in its woollen industry, but as a nation among nations, will compare with its neighbors. Unless he can see this much at least, he will come away disappointed.

Each international exhibition has been the child of circumstances, not to say of adversity. The Paris Exposition of 1867 made the nearest approach to symmetry and completeness of arrangement. Yet it was only an approach, although it was the supreme effort of the most enlightened and proficient despotic bureaucracy that the world has probably ever seen. The other exhibitions all outgrew the ideas and capacity of those who projected them. To speak paradoxically, they succeeded too well, inasmuch as they succeeded in exhausting the resources of their managers. Such is to be the case, we apprehend, at Philadelphia. So far as Dr. Schwarz's theory may have been intended for the Centennial, we have only to say that it comes too late, and even if it had come in season it could not have been adopted by the Centennial Commission. That Commission is anything but a bureau of scientists. It is only a committee of business men, whose hands have been tied from the start, who have labored under disadvantages of every sort, who have done the best they could under the circumstances, and who are perfectly aware of their shortcomings. For a long while the very existence of the Centennial was an open question. Debarred from national subsidies, dependent upon State and municipal aid, it is only within the past six months that the Commission have convinced themselves and the world at large that the Centennial would in truth come into being. Now, by a revulsion of opinion which is common to all such enterprises, there is, perhaps, a trifle too much zeal for the Centennial, too much alacrity to participate in its benefits. The representatives of more than one European government have demanded an increase of space, and even Russia, which this time last year gratified an old grudge by snubbing the invitation extended to it, has reconsidered its action and decided to accept. It is self-evident that amid this conflict of hope and fear, doubt, delay, and hurry, the demands of pure science must give way to considerations of a more practical nature. The arrangement adopted by the Commission seems to us to be the only feasible one. It does not admit of such delicate adjustment of details as that which was carried out at Paris, but it promises to be far more satisfactory than the "herring-bone" at Vienna. The area of the Main Pavilion, a rectangular building, is to be divided into longitudinal and transverse zones, the former serving for the grouping of articles by departments, the latter by countries. This is not ideal perfection; there will be overlapping here, and crowding there. But it is a tolerable working plan. It will enable the visitor to compare his own country with another, it will also enable him to study different classes of products without too much fatigue and loss of time. It should satisfy both tourist and technologist, provided they do not make demands which it is beyond the power of an international exhibition to meet.

As to Dr. Schwarz's method of ensuring a juster apportionment of space among exhibitors we have also misgivings. In theory it may be possible to devise a formula for apportioning space according to the percentage of value which a certain article has in the trade of the world. But in practice the case is quite different. A world's-fair is not a government institution for the instruction of the people. It is a business enterprise, and like other business enterprises it is dependent for its success upon the observance of the usual business principles. In one sense it is not justice, abstract justice, that the heavy manufacturer should have to content himself with a few square feet in an odd corner, while the dealer in patent medicines or stove-polish has a commodious stand in the central aisle But if we go into the origin of the difference we may find that there is no injustice after all. The dealer may have had faith in the exhibition from the moment it was proposed, and put in his demand for space accordingly; whereas the heavy manufacturer, mistrustful and cautious, may have held back until the last moment. Experience warrants us in regarding this supposition as more than a supposition—as, indeed, an actual fact. We believe that in general the dealers, those who expect to sell on the spot, are more ready to take part in an exhibition than the manufacturers, who look upon their returns as less immediate and certain. This is only human nature; however much we may regret it, we cannot change or ignore it. So long as the managers of an exhibition are not the agents of a government strong enough and despotic enough to compel its citizens to exhibit in the way it deems best, just so long will they remain what they are—business men who have to act upon the old-fashioned rule of first come, best served. We must be satisfied if they only do apply the rule, and are not governed by considerations of an improper nature.

Dr. Schwarz's plan is perhaps feasible upon a narrower field than that of an international exhibition. If the government of some compact and thoroughly organized country—the German Empire, for instance—should resolve upon making a complete and scientifically arranged display of all its resources and industry, it might succeed. The Berlin Bureau of Statistics could sum up with accuracy the total value of the trade and manufactures of the Empire and calculate to a nicety the relative value of each branch. The Imperial Government, having at its command a host of perfectly trained officials familiar with the minutest detail of public and private activity, could bring a powerful pressure to bear upon each individual producer. This pressure, if wisely and persistently exerted, could scarcely fail of its aim. The country would not only respond, but it would submit to the regulations and restrictions imposed by the Government. But from such a national exhibition, even if it succeeded perfectly, to an international exhibition on like principles, is a long step. We doubt if even the German Government would be willing to undertake it.

## THE TRIPLE ALLIANCE ON THE EASTERN QUESTION.

PARIS, Nov. 5, 1875.

THERE is every indication that the Eastern question is reopened, and it will take for a time the first place in the preoccupations of Europe. The Herzegovina match has been touched to a fire which will never again be extinguished. The great feature of the situation in Europe is the alliance of the three Emperors of Germany, of Austria, and of Russia; and there can be no doubt now that the principal objective, to use a military term, of the alliance has been the solution of the Eastern question. It has been decided

between the Chancellors of the three courts (and time will show whether they have assumed or not an impossible task) that the Eastern question must be solved without war, that it must be solved without the interference of France and over the head of England; not that England will be excluded from the final settlement, but her influence in the solution of the question will not be allowed to be predominant.

It is a great mistake to have ever supposed that Prussia did not desire the aggrandizement of Russia. Prince Bismarck is too acute, too far-seeing to hope to keep Russia chained, like a polar bear, within its actual limits. It is the interest of Germany that the ambition and activity of the Russians should find an outlet in the possessions of the Sultan rather than in the possessions of Germany and of Austria. If the Russians find their way to Constantinople, if they claim their right to have a free access to the Mediterranean Sea, the Germans will be encouraged in their hope of getting a larger share in the possession of the coast of the Northern Sea. Nothing could be easier than to bring about an understanding between Russia and Prussia on the Eastern question. Prince Bismarck could give *carte blanche* to Prince Gortchakoff in the East without compromising in the slightest manner the interests of Germany which are confided to him. The difficulty could only begin with Austria; and as it suited both Germany and Russia that the Eastern question should receive a pacific solution, it became necessary to satisfy Austria, or, at any rate, not to drive her to any desperate action. But what could Austria do in the face of Prussia allied to Russia? She has been so humbled that her old spirit is quite destroyed. The Emperor, who has lost his Italian provinces, who has lost the leadership of the German confederation, has become shy, timid, and nervous; his only desire is to live from day to day; and Bismarck does not wish to humble him any more; on the contrary, it suits him not to see Austria, a semi-German empire, too much degraded. He has adopted the old theory of the *Allgemeine Zeitung:* Austria has a providential mission in the valley of the Danube; she imports civilization from Germany proper, and exports it among the many races which are living in the eastern part of her empire, and in the provinces which are now dependencies of Turkey.

It would be impossible to give the details of the agreement which has been made between Prussia, Austria, and Russia on the many questions connected with the settlement of the Eastern question. But it is impossible not to see that there is a plan; the insurrection of the Herzegovina was the opening of the drama. The Great Powers did not give any direct encouragement to the insurrection; on the contrary, it was left to Austria to discourage the Servians, the Montenegrins, and all the populations which could easily be induced to revolt against the Sultan. At the same time, an impression was produced: it became apparent that Turkey was living only as it were on sufferance in Europe, and that it was always in the power either of Austria or of Russia to bring its life to an end. The curtain was lifted from the bed of the sick man, and he was shown to the world. It was not enough to prove to the world that the Turkish rule was threatened on all sides by the Christian populations; it was necessary to precipitate the bankruptcy of Turkey. England and France had, since the Crimean war, supported the fallen empire of Constantinople; loans had been contracted year after year in London and in Paris; great reforms had always been promised, but these promises had never been executed; the contractors of these loans made great fortunes; new palaces were erected on the Bosphorus; the choicest diamonds in the world found their way to the harems of Constantinople; but the empire was falling into an abyss of misery; the pashas exacted by force from the impoverished populations taxes which they could only pay with the greatest difficulty. The sham civilization which had been introduced into the country of Islam was only a theatre-curtain, which covered the abominable corruption of a few men and the wretched poverty of the many. The soldiers received no pay; the functionaries were paid with paper which they had to discount.

The end has come. General Ignatieff went to the Sultan and showed him one of the bonds of the Turkish debt. "How much did you receive for this from your English and French money-lenders? The nominal value of this bond is 100; you did not receive more than 50, on the average." The Sultan called for the Grand Vizier, and said to him: "My ministers have been very foolish; the Christians only gave me half the capital which I must reimburse to them; it is wrong; pay only from this day half the interest which was first agreed." And so Turkey became half bankrupt, and the shock which her finances has received is so severe that many men ask themselves whether it will be possible for her to pay the half of the interest of her debt. The object of the great courts was obtained. The only losers in the affair were the English and French investors, who had hoped to prop up the rotten edifice of the Turkish Empire. Turkey had fallen in the estimation of the world; she had no money and had lost her credit; and the promises which Turkey made to the investors whom she had disappointed still gave them an interest in a pacific and quiet settlement of the Eastern question. If the Russians entered Constantinople by sea they might throw the innumerable bonds of the Turkish debt into the Bosphorus; but if Turkey, humbled, ruined, and despised, was forced to come to some agreement with the three courts, perhaps her debt might be partly recognized. Turkey from this day has ceased to be a power of the first order; she has sunk to the place where the Christians ought always to have kept her. The great Sultan stands in the position of a foolish young man, who has lost everything, and who goes to some relation who must put everything in order and give him a pittance.

What the pittance will be is probably only known by very few men. There may be a sort of confederacy formed in the East, in which the Sultan, confined to one province, would only rank like the prince who rules now in Roumania or the Prince of Servia. Russia might accept the protectorate of this new confederacy. The Sultan may be forced to leave Europe and to remain in one of his pashaliks in Asia. The divisions and rivalries of the races in the East make this settlement very difficult. Among these races, the Slaves form the most numerous and fanatical nucleus; even in Austria they have often become very troublesome; the hatred of the Croatians against the Hungarians was the principal cause of the failure of Kossuth's attempt in 1849. The protectorate of Russia would be hailed with joy by all the Slavic populations of the East. What will be done with Egypt in the new combinations which have been planned? England has so long assumed a sort of protectorate of the Ottoman Empire that she can hardly witness a sort of partition of this empire without either asking for a part of the spoils or without going to war. The second would be the proudest, the first the most easy, mode of action. How is England to go to war against a coalition of three powers like Prussia, Austria, and Russia? France, whom she abandoned in 1870, for whom she did not even utter a diplomatic protest when old provinces were torn from her territory—France can do nothing for her in the East. France needs no possessions in Asia or Africa, she does not care any more about the East; it is indifferent to her how the mantle of the great Sultan may be cut in pieces. There is and there will long be but one question for her: the question of Alsace-Lorraine. France has become the nation of one idea. She has no right to compromise her influence, her financial prosperity, her new army, in distant adventures.

England may therefore be left quite alone in the cold at the moment when the "sick man" comes to die. Great armies will march on the Danube from the north and from the west, and what will she do? She may call for a congress or conference: there she will find herself in a minority. No party in England desires a war; the material interests of the nation would suffer too great a shock from any long struggle with Europe. The English press is already preparing the country for a pacific solution of the Eastern question. "Since the Suez Isthmus has been cut," say the leaders of opinion, "England need not care so much about Constantinople; all she requires is a free road to India. Egypt must be kept free." Such are the words you now hear falling from the mouths of English statesmen.

Will Russia consent to see the Khedive become a vassel of England instead of a vassal of the Sultan? Will England ask for a neutralization of Egypt and of the Isthmus? How are the Powers to deal with M. de Lesseps and the French shareholders of the Canal? These are questions which will probably soon arise. The Khedive is already invited on many sides to make himself completely independent of the Porte; the English financiers would be quite pleased if he sent the annual tribute which he owes to the Sultan to the Bank of England. Practically, the Khedive is a sovereign prince; he has, unfortunately for himself, plunged into debt, and his financial embarrassments place him in the hands of the City of London. It is a new feature of the time to see financial questions intermingled so closely with political questions. England will have to abandon the long-cherished theory of the integrity of the Ottoman Empire; she will witness a partition, in some form or other, of this Empire; she will herself probably only make a stand on this question of Egypt and the Isthmus. If Egypt has been promised to her, the Eastern question may be solved with the greatest ease; if England, as I incline to believe, has received no guarantee of any kind, we may expect to enter on a phase of long and difficult complications.

# Correspondence.

## ODIUM PHILOLOGICUM.

To the Editor of The Nation:

Sir: In your issue of Oct. 21 there is a paragraph, at p. 261, with reference to a part of which I confidently appeal to your sense of justice.

Coupling Mr. R. G. White with myself, you remark that, in the controversy between us, "the abuse became so foul that one of the disputants was obliged to veil his epithets in the obscurity of a dead language." The foulness of abuse, as you deem it, which reached this pitch, was not on my part, and I think you should have made it plain that I am not the offender whom you point at.

Adverting to some comments which you made nearly two years ago, you repeat your opinion, "that the explanation of the fury which is apt to mark philological discussions is to be found in the fact that 'a man's speech is apt to be, or to be considered, an indication of the manner in which he has been bred, and of the character of the company he keeps.'"

Your article in which this passage occurs, headed "Odium Philologicum," appears to take for granted that I, equally with Mr. White, have drawn, from such considerations as a man's pronunciation, choice of language, etc., the inferences which you specify. I would be allowed to deny that I have done so. Of your "fact," as a general position, I have nothing to say.

As to the most approved pronunciation, I am satisfied, towards ascertaining it, with the decisions of the latest and most accredited English lexicographers. Further, in numerous cases where an expression, or a given sense of an expression, has been impugned as vulgar or the like, my argument, if I conclude it to be otherwise, consists in simply adducing printed proof to the contrary. In support of my conviction that any particular thing in our language is polite, or even allowable, I never take my stand on what I have heard with my own ears. Free intercourse, almost uninterrupted, with highly-educated Englishmen for nearly thirty years, might warrant me in being less exclusive as to the grounds of my philological judgments; but it is to grounds which any one may verify that I prefer to restrict myself.

This rule of procedure I am not aware that I have ever violated. Lest, however, I should see repeated for the twentieth time, and once more urged against me, a passage contained in pp. 50, 51 of my 'Recent Exemplifications of False Philology,' I hope you will permit me a brief explanation.

Mr. White lays down that to sound as in *father* the *a* of *glass*, *last*, and *pastor*, "is the surest indication, in speech, of social culture which began at the cradle." These words, thus sounded, I have told Mr. White, "come perilously near being vulgarisms"; and I have added: "The gossips that haunted his cradle must have been miserably underbred."

This style of pronunciation, Mr. White likewise says, "indicates breeding rather than education"; and no one can question that it is his own style. While, however, he gives no authority for it, save the chilling pronouncements just quoted, I have stated that, in the words above mentioned, the "*a*, according to all the orthoëpists that I know of, is exactly that in *an* and *at*." These orthoëpists I take to be trustworthy exponents of the pronunciation enjoined by "breeding," or the well-bred; and hence, having accepted concessively the standing-point which Mr. White assumes in the matter, I surely committed no very serious trespass in rating less highly than he rates the sympathizing neighboresses who moulded his loquiscential utterances.

The late Bishop Wilberforce was reckoned a perfect model as regarded orthoëpy, and his *after*, *alas*, *master*, *pass*, *staff*, etc., etc., had the sound of *a* in *fat*. It is nothing that I often noticed this myself. Will any one who recollects his oratory testify contrarily?

Finally, as to the view that such an exorbitance as "fury" has ever marked any of my "philological discussions," I have only to express my surprise (which is always of the very mildest type) that my hostile critics should fail to recognize in its true character the mere earnestness of a patient seeker after truth, when he finds himself face to face with a deficiency of the scientific in practice and in principle.

Your obedient servant, FITZEDWARD HALL.

HILL HOUSE, MARLESFORD, WICKHAM MARKET, Nov. 4, 1875.

---

[We thought we had sufficiently indicated in the article on the "Odium Philologicum," by our quotations from Mr. Grant White, that, in the case in question, we considered him the principal, if not the only, offender. We ought perhaps also to have mentioned in our recent "note" on the same subject that it was he who had to veil in the obscurity of the Latin tongue some of his observations on Dr. Hall. We admit, too, freely, that it is Mr. White's method—viz., the following up of a hostile philologist to his mother's knee—which begets most of the excesses of language by which these controversies are marked. But having said this and expressed our regret for doing Dr. Hall even seeming injustice, we must repeat our belief that anybody who "locks horns," as the late Horace Greeley used to say, either with Mr. White or any other word-critic on questions of grammar or usage or pronunciation, must expect the encounter to be marked by atrocities of which he will inevitably have to bear a portion of the blame. The public sees the dust and hears the clash of the weapons and the shouts of the combatants, but which is most responsible for the disturbance it does not take the trouble to decide. —ED. NATION.]

## SHERIDAN'S DEATH-BED.

TO THE EDITOR OF THE NATION:

SIR: It seems to me that the writer of the notice of 'Personal Reminiscences' in No. 535 of the *Nation* is much too swift in denying the truth of the picture drawn by M. Taine of Sheridan's death-bed. M. Taine states substantially that the dying man was arrested on his death-bed by a bailiff, and would have been taken off in his blankets had it not been for the doctor's declaration that the sick man would die on the road; that a newspaper appeal shamed the great lords into leaving their cards at his door as he was breathing his last; and that he had lords at his funeral, and bailiffs at his death-bed. Your reviewer says that Taine has "taken the popular tradition as to the circumstances of Sheridan's death," and that "Michael Kelly, fifty years ago, had published a flat contradiction of the popular stories on the subject." I do not know what the "popular stories" or "tradition" are, but the above account by M. Taine is fully confirmed by Moore in his 'Life of Sheridan,' published in the same year with Kelly's book, 1825, and it is not contradicted by any of your reviewer's quotations from Kelly, which state only that Sheridan was not in want of the common necessaries of life, that he returned a gift of £200, and that "his own man" said that Sheridan wanted for nothing, and that all contrary stories were false. Your critic admits the truth of the story of the "death-bed *capias*," but comforts us with the remark that "*capiases* were an everyday affair in Sheridan's life, and they had long ceased to have any terrors for him." Moore, however, gives rather a different view. Pp. 442–4 of Volume II. (2d ed.), he says: "One of the most humiliating trials of his [Sheridan's] life was yet to come. In the spring of this year [a year before his death], he was arrested and carried to a spunging-house, where he remained two or three days. . . . On his return home, all his fortitude forsook him, and he burst into a long and passionate fit of weeping at the profanation, as he termed it, which his person had suffered." In his last sickness, shortly before the arrest mentioned by Taine, Sheridan writes to Mr. Rogers, pp. 454–5: "I am absolutely undone and broken-hearted. . . . They are going to put the carpets out of window, and break into Mrs. S.'s room and *take me*" (the italics are his own); "for God's sake, let me see you." Mr. Rogers went and saw him, and by paying £150 saved him *that* time. As to the desertion of his death-bed, which you say "was made out of whole cloth," Moore says, p. 461, "This is a subject on which it is difficult to speak with patience," and he relates at length the facts given by M. Taine; and, after enumerating the king's brothers, the peers, and great men who carried the pall, and whose carriages swelled the funeral pageant, he says it was not a little interesting to see, walking humbly side by side in the procession, "the only two men whose friendship had not waited for the call of vanity to display itself—Dr. Bain and Mr. Rogers."

Very respectfully yours, S.

BOSTON, October 31, 1875.

---

[We had no intention, as our correspondent seems to suppose, of representing the death-bed of Sheridan as an enviable one, or of intimating that because *capiases* were an everyday affair with him, he had contracted a liking for sheriffs' officers. But there is a direct contradiction between Moore (whom Taine evidently followed blindly) when he speaks of the "only two men whose friendship had not waited for the call of vanity to display itself" as being Dr. Bain and Mr. Rogers, and Kelly. The latter took the pains to investigate Sheridan's pecuniary condition at the time, and found, 1st, that there was nothing he could do for his friend, and, 2d, that people of distinction and wealth (the £200 seems to have come from some relative of the king) were interesting themselves in him. If our correspondent will compare Taine's account with Kelly's, he will see that the former has wholly overlooked or slurred over the contemporary controversy as to Sheridan's death-bed, which was of sufficient importance to his friends to induce them to take an active part in it.—ED. NATION.]

# Notes.

DODD & MEAD have nearly ready 'The Relations of Civil Law to Ecclesiastical Polity and Property and Discipline,' by Justice Strong, of the U. S. Supreme Court.——A 'Dictionary of Cookery' is announced by Cassell, Petter & Galpin.——J. W. Bouton will publish 'Etchings from the National Gallery.'——The fourth volume of Max Müller's 'Chips' is announced by Scribner, Armstrong & Co.——'Our Place among the Infinities,' by Richard A. Proctor; and 'The Five Senses of Man,' by Prof. Bernstein, of Halle, are in the press of D. Appleton & Co.——Macmillan & Co.'s fall list includes the following works not already mentioned by us: 'The Makers of Florence,' by Mrs. Oliphant, uniform with 'Holland House'; 'The History of Eton College,' by H. C. Maxwell Lyte, illustrated, and uniform with the foregoing; 'Political and Military Episodes during the First Half of the Reign of George III.,' by E. B. Fonblanque; 'The Ecclesiastical History of Ireland, from the Earliest Date,' by W. D. Killen, D.D.; 'Shakespeare's Plutarch's Lives,' by the Rev. W. W. Skeat; 'The Austrian Arctic Expedition,' by Lieut. Payer; and 'Angola and the River Congo,' by Joachim Monteiro.——F. B. Patterson will shortly republish in book-form Mr. Geo. A. Baker, jr.'s series of essays on the 'Bad Habits of Good Society.'——Jansen, McClurg & Co., Chicago, announce 'Graziella,' an episode in the life of Lamartine, translated by James B. Runnion.——Jas. R. Osgood & Co. announce 'Essays,' by John Fiske.——'The Life and Works of Count Rumford' will be published by Estes & Lauriat.——Roberts Bros. have in preparation 'Eastern Life, Past and Present,' by Harriet Martineau; and 'Protection for Majorities,' by Josiah P. Quincy.——Robert Clarke & Co. announce the 'Poems of George D. Prentice,' edited by J. J. Piatt.——Students of the history of the present century will be glad to learn of a very valuable compendium just about to appear in England, 'The 'Map of Europe' by Treaty, 1814–1875.' This work is in three volumes royal 8vo, pp. xxxvi.–2,400, and is designed to show the political and territorial changes which have taken place since the general peace of 1814. It therefore contains declarations of war, treaties of peace and boundary, decrees annexing territory, protests, reports of European conferences, etc., etc., illustrated by numerous notes and colored maps, and accompanied by a copious index. The editor is Mr. Edward Hertslet, librarian and keeper of the papers, Foreign Office.

—We lately noticed the publication, by August Auerbach, Stuttgart, of a German translation of Prof. C. K. Adams's 'Democracy and Monarchy in France.' It appears that this was the beginning of a "line" which the enterprising publisher has undertaken with a view to making known to German readers the productions of contemporary American writers—in each case by special arrangement with them. We hear of Mr. Bigelow's 'Autobiography of Franklin' as in preparation, and in the meantime Herr Auerbach sends us Bayard Taylor's 'Geschichte von Deutschland' and Francis Parkman's 'Die Pioniere Frankreichs in der neuen Welt.' That Mr. Taylor's school-history of Germany should not be coals to Newcastle is certainly complimentary to the author. The translation has been made by his wife (*née* Marie Hansen), and its exactness is consequently assured. The work is provided with eight historical maps. The translator of Mr. Parkman's 'Pioneers of France' is not named, nor is it stated on the title-page that only the second part of the original, relating to Champlain and his associates, is here reproduced. This is, however, not overlooked in the Introduction by Dr. Friedrich Kapp, the reason for the omission being that the Huguenot settlements in Brazil and Florida had no real connection with the founding of New France. The German version is noticeably closer and, with the above exception, fuller than the French of the Countess Clermont-Tonnerre which Didier published last year. Dr. Kapp gives a sketch of Mr. Parkman's life based on that of the Abbé Casgrain (Quebec, 1872), and considers the value of his works for German readers to lie in the picture they give of that French absolutism from which the German people suffered so much—directly from the wars and devastations of the two Louises, and indirectly from the aping of French manners and immorality and the senseless copying of the French political system (*Staatswesen*). He announces that the kindred work on 'The Old Régime in Canada' will next be put forth, and if these volumes meet with favor the rest of Mr. Parkman's works will follow in due time. We would call the attention both of teachers and of students of the modern languages to this German-American series of Herr Auerbach's, as furnishing a capital means of exercise in translating from one tongue into the other. It would, we think, have been wise to give a uniform size to the volumes.

—A correspondent writes us from London, under date of November 6: "Mr. Henry Irving's *Macbeth*, which, on the actor's first appearance in the part in London some six weeks ago, produced not a little disappointment in the general public, seems to have been accepted as an interesting if not a triumphant attempt, and is exhibited to audiences numerous if not overflowing, and deferential if not enthusiastic. Considering the actor's reputation, indeed, the very undemonstrative attitude of the spectators at the Lyceum is most noticeable. Mr. Irving's acting is, to my mind, not of a kind to provoke enthusiasm, and I can best describe it by saying that it strikes me as the acting of a very superior amateur. If Mr. Irving were somewhat younger, and if there existed in England any such school of dramatic training as the Conservatoire of Paris, any such exemplary stage as the Théâtre Français, a discriminating critic might say of him: 'Here is an aspirant with the instincts of an artist, and who, with proper instruction, may become an actor.' But, thanks to the absence of a school and of any formidable competition, success has come easily to Mr. Irving, and he has remained, as the first tragic actor in England, decidedly incomplete and amateurish. His personal gifts—face, figure, voice, enunciation—are rather meagre; his strong points are intellectual. He is ingenious, intelligent, and fanciful; imaginative he can hardly be called, for he signally fails to give their great imaginative value to many of the superb speeches he has to utter. In declamation he is decidedly flat; his voice is without charm, and his utterance without subtlety. But he has thought out his part, after a fashion of his own, very carefully, and the interest of his rendering of it lies in seeing a spare, refined man, of an unhistrionic—of a rather sedentary—aspect, and with a thick, unmodulated voice, but with a decided sense of the picturesque, grappling in a deliberate and conscientious manner with a series of great tragic points. This hardly gives an impression of strength, of authority, and it is not for force and natural magic that Mr. Irving's acting is remarkable. He has been much criticised for his conception of his part—for making *Macbeth* so spiritless a plotter before his crime, and so arrant a coward afterward. But in the text, as he seeks to emphasize it, there is fair warrant for the line he follows. Mr. Irving has great skill in the representation of terror, and it is quite open to him to have thrown into relief this side of his part. His best moment is his rendering of the scene with the bloody daggers—though it must be confessed that this stupendous scene always does much toward acting itself. Mr. Irving, however, is here altogether admirable, and his representation of a nature trembling and quaking to its innermost spiritual recesses really excites the imagination. Only a trifle less powerful is his scene with Banquo's ghost at the feast, and the movement with which, exhausted with vain bravado, he muffles his head in his mantle and collapses beside the throne. Mr. Irving has several points in common with Edwin Booth, and belongs to the same general type of actor; but I may say that if, to my thinking, Edwin Booth comes nearer being a man of genius, I find Mr. Irving more comfortable to see. Of Miss Bateman, who does *Lady Macbeth*, the less said the better. She has goodwill and a certain superficial discretion; but a piece of acting and declaiming of equal pretensions, more charmless in an artistic way, it has not been my fortune to behold."

—It is estimated that about one person in eleven hundred in the United States is mentally deranged. These figures, although more favorable than those for many other countries, give a motive for careful study by the laity, as well as by physicians, of the outline of the modern treatment of the insane, especially as four-fifths of our institutions for their care belong to the public. Dr. Charles F. Folsom, of Boston, Secretary to the Massachusetts Board of Health, has introduced in some interesting letters from Europe (*Boston Medical and Surgical Journal*, Vol. XCIII., Nos. 7, 9, 11, 16) observations on this subject made abroad which merit a more general circulation than a strictly professional journal commands. These show that the treatment by confidence, as it may be called—that is, not only the abolition of direct mechanical restraint, but the absence of indirect confinement, as by locked doors or barred windows, or even by walls at the boundaries of the grounds—can be successfully used in a very large proportion of unselected cases. That "the more you trust, the more you may" could be possible in any enlarged sense with the insane, is an outgrowth of the teachings and the practice of Dr. Batty Tuke, by whom this open-door system was introduced less than five years ago at Cupar-Fife, Scotland. "Restraint is neglect" is a maxim with the best alienists, and inattention is equally neglect. This disuse of barriers would be inattention were there not enough competent attendants, and were not other agencies invoked. Congenial and constant employment, cheerful surroundings, and the perpetual cultivation of self-respect and self-control, are powerful aids in the care and in the cure of the insane. At Munich, it is claimed that the in-

fluence of the beautiful in the rooms and grounds for the most demented has reduced that very troublesome class, "the filthy," seventy-five per cent. The medicinal treatment of the insane does not concern us as laymen, nor are the methods alluded to all novel in this country; in fact, the increase of liberty and comfort was once known as the American system. But the description of what Dr. Folsom has seen, and especially a letter from Dr. John Fraser, of Scotland, which he reproduces, deserve the attention of philanthropists as the latest and most advanced experience in this interesting province.

—If Mr. Freeman has any sense of humor—and we believe his friends claim it for him—he will be amused with an article in the last number of the *International Review*, written by a gentleman who outherods Herod in his development of one of the hobbies of the historian. Mr. Freeman, as our readers know, is the protagonist of that school of students of English history who shake the dust off their feet when they leave the houses of those who talk of "Anglo-Saxon" literature or recognize any historical people as "Anglo-Saxons" England is the only name they are willing to give the island, and English the only name they are willing to give to the language of the inhabitants, at whatever date. According to this theory, as we understand it, the tribes which migrated to England from that part of the continent now called Schleswig-Holstein, either on their way across, or immediately on their arrival, began to talk, not Anglo-Saxon, but "the common language of Shakspere and Milton," and from that day to this the language of the people has been and remained English. We have always thought it would be strange if some traces of this tie between the Schleswig-Holsteiners on the continent and that branch of the tribe now governed by Queen Victoria were not apparent, and it seems from the article to which we refer, on Ernst Curtius, Müller, and Mommsen, by Robert P. Keep (late U. S. consul at Athens), that it is plainly visible and probably even audible. In the summer of 1873 Mr. Keep visited, he tells us, Schleswig-Holstein, the cradle of the race, as we may call it, and "had the privilege of spending some hours in the society of Professor Jansen, of the Gymnasium at Kiel." He was received hospitably, but noticed from the first that there was something strangely familiar about everything he saw and everybody he met, and shortly found out that what struck him was "something English in the physique and physiognomy of many of those whom he met"; on entering the Professor's house he "not only found what seemed like an English home," but was surprised to find that the Holsteiners took "what may be called the English point of view." At last he cried out: "Why, what does this mean? I have seemed to see about me in the streets English faces and English forms, and now on entering your house I discover an ability on your part to enter into my views, and a sympathy on my part with yours such as is usually found only in those of the same race and language." To this the Professor replied without hesitation that such a state of affairs was natural enough, inasmuch as this was the very ground from which the English came, and since, in fact, "we [the Schleswig-Holsteiners] *are* English," or rather "the English are the descendants of our fathers." It seems from this that the sort of feelings which Americans often say they have on going for the first time to England—a feeling of return to one's real country—must be closely akin to that which the British feel on going back to the parent "lodge" on the Continent. A more striking and touching instance of blood being thicker than water we have rarely met with than in this recognition (after a race-separation during all these years) by Mr. Keep, on setting foot in Jutland, that he had really got back to the "old home" again.

—The success of the Austrian Expedition promises to revive the waning interest in Polar discovery. Thus far, the English national and private parties have been the principal tangible result of this enthusiasm. In Germany, the Government invited a number of gentlemen to examine the whole matter and give an opinion upon the desirableness of an expedition. This commission, under the presidency of Privy-Councillor V. Möller, contained Prof. Dove, Dr. W. Siemens, and Baron v. Richthofen (President of the Geographical Society) of Berlin; the astronomers Winnecke, Rumker, H. Karsten, and Prof. Bruhns, of Strassburg, Hamburg, Rostock, and Leipzig respectively; Prof. Neumayer of the Admiralty; Prof. Zittel, Munich; Grisebach, Göttingen; Prof. v. Quenstedt, Tübingen; Prof. Karslen, Kiel; and Prof. Schimper, Strassburg. They have just finished their labors, and have reported adversely to further exploration, on the ground that we have as yet too little experience to render such expeditions profitable. They recommend, however, the establishment of stations in high latitudes, both at the North and South Poles, for meteorological observations, and that, to this end, the co-operation of other nations should be invited as far as practicable. This, we suppose, renders any German exploring party an impossibility for the present, as private enterprise is hardly likely to get out ships suitable to this end unaided by the Government. This reminds us that at the recent (the forty-eighth annual) meeting of the German Scientific Association in Gratz, Lieut. Weyprecht read a little paper on the objects of Polar expeditions. He believes their real value consists in the opportunity offered for studying physical and biological problems under very exceptional conditions, and that, in the future, physics, botany, and zoölogy must take the precedence of mere geographical discovery in the more limited sense. The purpose of an Arctic journey, he says, must be something more than the nomenclature of several newly-discovered bays or bits of land, deeply buried in ice, or the attainment of high latitudes. This is very true, and a good view for the closet and scientific circles; but, as Petermann said last winter, it is extremely "fortunate for science that the North Pole is yet unreached, the source of the Nile still undiscovered, and other noted problems not yet solved," and that all progress will be made slowly.

—The *Galaxy* for December contains an article by Mr. H. James, jr., on Balzac which we believe is a real contribution to the literature of the subject. Mr. James notices the fact of the extremely inadequate discussion which Balzac had received, not merely at the hands of English critics, but also in France, and attempts to supply the defect by an analysis of his writings. The conclusion which he reaches would probably be supported by nine out of ten readers—that Balzac's strength lay in his wonderfully minute description and portraiture of the life in France which he knew best, and which we could perhaps best make into English by calling boarding-house life—a term which, at any rate, has the merit of suggesting to English or American readers just the sort of unpleasant associations, though in an infinitely less degree, that crowd Balzac's pages. As to aristocratic life, Mr. James thinks that Balzac drew upon his imagination for his facts, and that consequently the pictures he drew of high life are exaggerations or caricatures. We are willing to confess to an insufficient familiarity with the works of Balzac—a writer much more talked about than read, we fancy, either in or outside of France—to speak *ex cathedrâ* of the various points raised by Mr. James; but we have found ourselves generally agreeing with him throughout. It must candidly be admitted that Balzac is an author of whom an immense amount might be lost with no little advantage to the world and relief to the tedium of life; and that the world itself is gradually coming to the same conclusion, and proceeding to carry it into effect in the ways so well known to itself, is highly probable.

—As a good specimen of the best kind of contemporary English low comedy, we have not seen a better piece of acting for a long time than that of Mr. George Honey as *Eccles* in "Caste," at Wallack's. The part is a somewhat burlesque part, the relations of the broken-down, maudlin father to his daughters being decidedly overdrawn for real effectiveness, and the apparently intended pathos of the situation frequently turning out, in obedience to that sort of dramatic "Grimm's law" which is so often noticed to be in operation on the stage, to be nothing more nor less than sheer bathos. Nevertheless, as a strictly comic part, within the limitations prescribed for him by the author, it would be difficult to conceive anything better done than Mr. Honey's impersonation of the drunken old "workingman," with his by-gone self-respect converted into shambling impudence, his ragged, disreputable make-up, and his masterly oratorical domestic efforts on behalf of "the poor and lowly." The type he represents is that of the laboring-man broken down by his own faults, who revenges himself upon society by undertaking the communistic rôle. It is a type familiar enough to everybody, either in real life or from the newspapers; and though probably not so well developed in the atmosphere of the "American bar" as in the patriarchal English pot-house, is still easily recognized and welcomed by an American audience. Mr. Honey is an actor who has the great merits of thorough seriousness (which, by the way, is just as important, though not commonly felt to be so, in a part like *Eccles* as in any other), a perfect command of his voice, a clear enunciation, and a great power of mobile expression. Of his class he is probably now much the best actor in this country, if we except Mr. Florence (any attempt to compare the two would be a failure, owing to the widely different range of their parts), and perhaps is more nearly on a level with Mr. Toole, many of whose characters were drawn from the same sort of London life which evolves and perfects *Eccleses*. Mr. Honey deserves all the more credit for what he is able to do with the part, because "Caste," like many if not all of Mr. Robertson's other plays, is nearly devoid of action, and its success depends entirely upon the manner in which the parts are brought out. As put on the stage at Wallack's, it would stand the suppression of any of the parts better than that of *Eccles*.

—The exasperation of the French scholars and literary men against

everything German has at any rate the effect of leading them to close intellectual relations with those peoples on the east who also feel themselves crowded, or in danger of being crowded, by victorious Teutonism. The latest manifestation of this philo-Slavic tendency is the 'Études Slaves' of M. Louis Leger, a moderate duodecimo, which, he says, may in a sense be regarded as a sequel to 'Le Monde Slave,' published two years ago. The various writings of this author in this field belong to the past ten years, and he announces a history of 'Autriche-Hongrie' in further continuation of them. The present volume is for the most part an interesting account of life and journeying in Russia; but the two closing chapters upon Bohemia—the country in which the contest of Teuton and Slave is at present most vigorously carried on—are the most significant portion of the work. One of these chapters is devoted to the present aspect of politics and public opinion in Bohemia, the other to an account of the political writings and views of the venerable historian Palacky, the most eminent of the champions of Bohemian nationality against the Germanizing movement. The Bohemians are not unnaturally indignant that while Hungary has received an independent government, their kingdom, equal in antiquity and in rights, should be left a mere province of Cisleithania. As to Panslavism, it is maintained that Russia is far from desiring any further extension of its already unwieldy empire towards the west; while Bohemia looks upon herself as the natural leader of the Slavic peoples. Russia, says Palacky, has as its basis "not the Slavic principles, but an amalgam of German and Mongol." The chapter on the Southern Slaves is very timely and instructive in the present complications. The author evidently believes in their future.

## BOYNTON'S REVIEW OF SHERMAN.*

I.

WE began to read this book with the expectation of finding evidence that Gen. Sherman, in his 'Memoirs,' had fallen into serious and important errors of fact, and had been betrayed by an untrustworthy memory into misstatements of events and unjust judgments of men. We lay it down with the conviction that the General's narrative is, on the whole, more accurate and his judgment fairer than we had supposed. We will try to show how this conviction is produced.

The author of the Review before us served through three years of the war with honorable distinction, as Major and Lieutenant-Colonel of an Ohio regiment, in the Army of the Cumberland, and was brevetted a Brigadier as a recognition of his merits. Since that time he has been the Washington correspondent of the Cincinnati *Gazette*, and has proved himself an indefatigable worker and a fearless and vigorous investigator of many matters which the public needed to have unearthed and exposed. His training, therefore, in both the military and the newspaper service fitted him to do very thoroughly the work he has here undertaken to perform—namely, to collate from the War-Office files the written evidence of the incorrectness and injustice of Gen. Sherman's 'Memoirs.' He says: "This book is a criticism upon Sherman as a general, only so far as the official records presented furnish such criticism. There is no attempt to contradict his statements except as the records contradict them" (p. 3). Testing the Review by this standard, we say broadly that, in nearly every matter of importance it discusses, the "records" cited do not "contradict" the General, nor do they convict him of "grave injustice both to the living and to the dead."

Sherman's Memoirs, like all such personal reminiscences, take some tinge of color from the feelings, the natural pride in his own great deeds, and the instinctive wish to present himself well to the eyes of posterity, which belong to the most candid and honorable mind. Absolute impartiality in judging of one's own career is not to be looked for in human nature; but we think Gen. Boynton's review will go far to convince candid and intelligent readers that Sherman is franker, fairer, and more considerate of others than most men in his place would be. This, however, is quite consistent with minor slips of memory, and with the capacity, in common with most Christians, to entertain some prejudices. More than this is certainly not proved in the volume before us. The Review dwells largely upon the fact that since the war Gen. Sherman has had "uninterrupted access to the official records," and, no doubt, this would be an aggravation of his offence if he should appear to have been reckless or unprincipled in his statements. If he does not so appear, the question of the extent of his search of the War Department files is of small account—nay, it gives critics like Gen. Boynton the better chance to test his memory and to help us do it. We may wish that Sherman had written a formal history, like the Comte de Paris, but he has not. Whether press of other work or indolence prevented him is of small account to us. We are glad to get what we have, and the only question is whether the personal recollections he has written are accurate and his opinions of men reasonably fair. Gen. Boynton says that Sherman's work, when "judged by the official record," is "intensely egotistical, unreliable, and cruelly unjust to nearly all his distinguished associates" (p. 8). We have read the evidence produced, and say that in no single instance does it justify such a judgment.

The Review is divided into chapters which may be called the counts of the indictment. The first of these is intended to support the charge that Sherman gave to Halleck the credit of planning the movement up the Cumberland and Tennessee Rivers in 1862, though he knew, or ought to have known, that it was Grant's conception. The evidence on the first part of the proposition is certainly conclusive. Sherman does say it was Halleck's plan, and tells a most interesting anecdote of Halleck sitting in his room in St. Louis and catechising Gen. Cullum and himself as to the plan of campaign, drawing pencil lines on the map to show the rebel positions, and, having thus made a diagram of their line, asking, "Where is the proper place to break it?" The natural answer was, the centre. Halleck drew the line perpendicular to the centre; it coincided with the general course of the Tennessee River, and he remarked, "That's the true line of operations." It would certainly be hard to state a plan more plainly, or to demonstrate it more nicely by diagram than Halleck did, and Halleck was then Grant's commander, and this was before Grant moved up the Cumberland and Tennessee Rivers under his orders. How, then, could it be shown by the "record" that Sherman is unjust to Grant? Plainly, first, by showing that Grant had previously submitted the same plan to Halleck; or, second, by showing that Sherman has told an imaginary story. The latter is not even suggested, and we must examine the "record" evidence which Gen. Boynton offers as to the former. This consists, first, of a letter to McClellan from Halleck, dated January 20, 1862, in which he opposes the idea of a campaign down the Mississippi, and says: "A much more feasible plan is to move up the Cumberland and Tennessee, making Nashville the present objective point. This would threaten Columbus and force the abandonment of Bowling Green," and he calls this "the great central line of the Western theatre of war" (p. 12). So far from having any contradiction of Sherman here, we have the most explicit corroboration. But what says the "record" as to a prior suggestion by Grant? Not a single word. The only data from the files which are quoted are telegraphic despatches from Grant and Commodore Foote to Halleck, dated January 28, in which they offer to take Fort Henry on the Tennessee, and there is neither intimation nor suggestion that they or either of them made any previous communication of the kind to Halleck.

On the evidence, then, that Grant and Foote proposed to move against Fort Henry eight days after Halleck had written his plan to McClellan, and no one knows how long after he had explained it to Sherman and Cullum, Sherman is charged with unjustly denying the credit of the conception to Grant. On this charge we think there should be no hesitation in acquitting Sherman.

The Review quotes also a letter from General Buell to Halleck, under date of January 6, which Gen. Boynton says sets forth "most of the ideas which Halleck afterwards submitted as his own to McClellan." Buell's letter distinctly proposes "a combined attack on its [the enemy's] centre and flanks" (p. 15), whereas Halleck was planning a decisive move on the centre alone to "break" the line—two things as different in strategy as day from night; and Halleck accordingly answers (p. 16) that Buell's is "a plain case of exterior lines," "which, unless each of the exterior columns is superior to the enemy, leads to disaster ninety-nine times in a hundred." But one is tempted to ask whether Sherman would have been guilty of cruel injustice to Grant, in Gen. Boynton's opinion, if he had given the credit of the plan to Buell, and what the friends of Admiral Foote might have said if he had given it either to Buell or to Grant? Grant and Foote indisputably deserve the great credit of courage and enterprise in carrying out the plan proposed; but if there were any doubt before, Gen. Boynton's compilation "from the files" makes it equally indisputable that the plan was Halleck's, and that Sherman was generous as well as just in giving it to him, in view of the subsequent breach of friendship between them.

The second charge is that Sherman was "mainly responsible" for a surprise of the Union army at Shiloh. This involves two points—first, that there was a "surprise," and, second, that Sherman was "mainly responsible" for it. As to the first point, it must be borne in mind that in military parlance a surprise does not mean simply an unexpected attack. It means

* 'Sherman's Historical Raid. The 'Memoirs' in the Light of the Record. A Review Based upon Compilations from the Files of the War Office. By H. V. Boynton, Washington Correspondent of the Cincinnati Gazette.' Cincinnati: Wilstach, Baldwin & Co.

more—viz., that the attack must be both unexpected and not provided against by the usual precautions as to timely notice. If pickets and vedettes are properly posted, so that there is time for an army to form for battle after the notice of a hostile advance is given by the outposts, it is no surprise. An enemy never sends notice of a purpose to attack at a given day and hour. No military authority would call it a surprise when an attack is made upon the proper front of an army which is covered by outposts and sentinels, from whom, in fact, such notice is received that the brigades or divisions in advance have time to form their line of battle. It is admitted that Sherman's division occupied the front of Grant's army at Shiloh. He says, in the 'Memoirs,' that his front was covered by outposts and pickets "*well out* on the roads," and that "one of our picket guards, composed of an officer and seven men, posted a *couple of miles* out on the Corinth road," was captured by a dash of the enemy's cavalry on the 4th of April, two days before the battle. Sherman's assertion in the 'Memoirs,' therefore, is that the line of outposts and vedettes was where it should be. On this point Gen. Boynton quotes "from the files" Sherman's testimony at a court-martial for trial of a colonel, which is still more explicit, for he gives the ground allotted to each brigade, and says "pickets, one company to a regiment, were thrown forward a mile and a half to the front, vedettes a mile further, making a chain of sentinels" (p. 29). Unless this statement can be proved untrue, it must be admitted that the camp was properly and fully covered by both the regular grand guards and sentinels. Gen. Boynton says, as to the pickets (p. 34), that "it is noticeable that Gen. Sherman fixes them much further from camp than all the other officers who have given testimony," etc. But as he has promised not to contradict Sherman without producing the "record," we look for the proof, and find not a single word on the subject from any officer of the Union army. We must, therefore, hold it proved that there was no fault in this respect. The quotations given by Gen. Boynton from reports of brigade commanders of Sherman's division all fully corroborate Sherman's statement, that after the alarm at the outposts, his troops had plenty of time to form, and, in fact, formed and advanced in line to meet the enemy; Buckland says thirty to forty rods, Hildebrand says three hundred yards (p. 33). The outposts had been sufficient, therefore, by the crucial test of having given the line time to form after a rapidly advancing hostile army drove in the sentinels. The "record" proves, then, that there was no surprise of Sherman's division, at least.

With the failure to prove the principal fact, the second part of the charge, viz., Sherman's responsibility, falls also; but we must notice the fact that the evidence adduced in the Review would have proved that if blame were to rest upon any one, it would have been upon Grant, the actual commander of the army. Gen. Boynton says Grant's headquarters were twelve miles away, and that Sherman, "while not technically in command of the entire camp, was constantly treated, trusted, and consulted by Gen. Grant as if he were the senior officer at the front" (p. 26). And again (p. 27), "Sherman was the senior officer on the main front." These assertions are intended to lead to the conclusion that if there were faults in the position of the divisions other than Sherman's, he was responsible for it, and, "holding steadily to the last, and against all evidence, to the belief that no immediate attack was probable, by impressing his convictions upon Gen. Grant, misled the latter as to the real condition of affairs along the front" (p. 26). As Sherman says, in a passage of the 'Memoirs' quoted on p. 27, "I was only responsible for my own division," and Gen. Boynton has promised only to contradict him by the "record," we look for the evidence on which the charges are based which we have referred to above; but we again look in vain. There is no evidence that Sherman was the senior officer present; and if there were it would make no difference, for Grant was in command in person, and there is no order or suggestion of an order from him to the other division commanders to report to Sherman for directions. He had ordered Sherman to superintend the disbarking of his own and Hurlbut's divisions, but nothing more. Indeed, Gen. Boynton himself says, "Other divisions as they arrived selected camps to suit themselves." This was on the 18th and 19th of March and the following days, the battle not being fought till the 6th of April. To assert, therefore, that Sherman and not Grant was responsible for the position of the cocqual division commanders, must, in the light of the "record," be held to be a contradiction of it as well as of Sherman.

As to Grant's relying upon Sherman's opinion, he would not, as commander, be absolved from responsibility by relying on any one's opinion; and there is no evidence that any peculiar closeness of relations had yet arisen between him and Sherman, as this was the very first movement in which the latter had served as his subordinate. But Gen. Boynton himself furnishes the evidence that Grant did not rely on Sherman's judgment in regard to the position and intentions of the enemy, for he quotes (p 32) Col. Buckland's report of the battle, in which that officer states that he learned from Sherman that his (Col. B.'s) report of the reconnoissance of the enemy's position on the 4th had been sent by Sherman to Grant the same night; and the language of Grant's report to Halleck on the 5th bears internal evidence of his receiving as the truth Buckland's report of the enemy being in force with all arms. If, then, the commander of the army was in as full possession of the facts on the 4th as Sherman himself was (for such is the evidence of the "record"), the assertion that the latter was responsible on the 6th for the position of divisions in no sense under his command, or for their state of preparation for combat, is shown to be wholly untenable, and, in view of Grant's well-known characteristics, the suggestion that he was mentally or morally under Sherman's controlling influence can only excite a smile.

The charge that Sherman did not do justice to Buell and his army at Shiloh appears to be limited in the body of the present Review to Sherman's failure to recognize the service they performed on the evening of the first day's fight, though in the summing up at the end of the volume it is treated as if he had failed to give them any credit whatever. In our original notice of Sherman's 'Memoirs' we referred to his cordial and generous recognition of their services on the second day, and the hearty praise he gives their division and brigade commanders by name. In failing to make this distinction clearly, Gen. Boynton is in danger of appearing to intend an injustice to Sherman. As to the first day, it is admitted on all hands that no part of Buell's army was on the field till after five o'clock in the afternoon, an hour so near dark at that season of the year that it cannot be alleged that much could have been done (p. 39). Gen. Buell's report of the battle says that when he saw Grant in person, before his own troops had come up, some persons were killed by the enemy's artillery and musketry "on the bank at the very landing"; that Nelson coming up with Ammen's brigade at the opportune moment, it was posted with a battery that was there to meet this attack, and, with the aid of the gunboats, repulsed it; "the attack on that point was not renewed, night having come on, and the firing ceased" (p. 42). Grant's report explains (p. 41) that this was at his extreme left, where he had thought the ravine which covered his flank and the protection of the gunboats made him safe, so that he had posted no force there but some artillery with a small infantry support. Hence the attack there did not show that the main line was not still far to the front where Sherman was, and he cannot be charged with unfairness in omitting a minor episode which did not occur under his own eye and which does not appear, under the light of the whole "record," to have any great significance. The charge of injustice to Buell and his army fails like those preceding it.

## DRAPER'S SCIENCE AND RELIGION.*

SOME twelve years ago, Dr. Draper published a bulky volume entitled 'A History of the Intellectual Development of Europe,' in which his professed purpose was to show that nations or races pass through certain definable epochs of development, analogous to the periods of infancy, childhood, youth, manhood, and old age in individuals. But while announced with due formality, the carrying out of the argument was left for the most part to the headings and running-titles of the several chapters, while in the text the author peacefully meandered along down the stream of time, giving us a succession of pleasant though somewhat threadbare anecdotes, as well as a superabundance of detached and fragmentary opinions on divers historical events, having apparently quite forgotten that he had started with a thesis to prove. In the arrangement of his "running heads," some points were sufficiently curious to require a word of explanation, as, for example, when the early ages of Christianity were at one time labelled as an epoch of progress and at another time as an epoch of decrepitude. But the argument and the contents never got so far *en rapport* with each other as to clear up such points as this. On the contrary, each kept on the even tenor of its way without much regard to the other. From the titles of the chapters one was led to expect some comprehensive theory of European civilization continuously expounded. But the text merely showed a great quantity of superficial and second-hand information, serving to illustrate the mental idiosyncrasies of the author. Among these idiosyncrasies might be noted a total incapacity to understand the part played by Rome in the work of civilization, a singular lack of appreciation of the political and philosophical achievements of Greece under Athenian leadership, a strong hostility to the Catholic Church, a curious disposition to overrate semi-barbarous or abortive civilizations, such as those of the old Asiatic

* 'History of the Conflict between Religion and Science. By John William Draper, M.D., LL.D.' Fourth edition. New York: D. Appleton & Co. 1875. 12mo, pp. xxii., 373. (International Scientific Series, XII.)

and Native American communities, at the expense of Europe, and, above all, an undiscriminating admiration for everything, great or small, that has ever worn the garb of Islam or been associated with the career of the Saracens. The discovery that in some respects the Mussulmans of the Middle Ages were more highly cultivated than their Christian contemporaries, has made such an impression on Dr. Draper's mind that it seems to be as hard for him to get rid of it as it was for Mr. Dick to keep the execution of Charles I. out of his 'Memorial.' Even in an essay on the 'Civil Policy of America,' the turbaned sage figures quite prominently; and it is needless to add that he reappears, as large as life, when the subject of discussion is the attitude of science toward religion.

Speaking briefly with regard to this matter, we may freely admit that the work done by the Arabs, in scientific enquiry as well as in the making of events, was very considerable. It was a work, too, the value of which is not commonly appreciated in the accounts of European history written for the general reader, and we have no disposition to find fault with Dr. Draper for describing it with enthusiasm. The philosophers of Bagdad and Cordova did excellent service in keeping alive the traditions of Greek physical enquiry at a time when Christian thinkers were too exclusively occupied with transcendental speculations in theology and logic. In some departments, as in chemistry and astronomy, they made original discoveries of considerable value; and, if we turn from abstract knowledge to the arts of life, it cannot be denied that the mediæval Mussulmans had reached a higher plane of material comfort than their Christian contemporaries. In short, the work of all kinds done by these people would furnish the judicious advocate of the claims of the Semitic race with materials for a pleasing and instructive picture. Dr. Draper, however, errs, though no doubt unintentionally, by so presenting the case as to leave upon the reader's mind the impression that all this scientific and practical achievement was the work of Islamism, and that the Mohammedan civilization was of a higher type than the Christian. It is with an apparent feeling of regret that he looks upon the ousting of the Moors from dominion in Spain; but this is a mistaken view. As regards the first point, it is a patent fact that scientific enquiry was conducted at the cost of as much theological obloquy in the Mohammedan as in the Christian world. It is true there was more actual tolerance of heresy on the part of Moslem governments than was customary in Europe in those days, but this is a superficial fact, which does not indicate any superiority in Moslem popular sentiment. The caliphate or emirate was a truly absolute despotism, such as the Papacy has never been, and the conduct of a sceptical emir in encouraging scientific enquiry goes but little way toward proving anything like a general prevalence of tolerance or of free-thinking. And this brings us to the second point—that Mohammedan civilization was, on the whole, rather a skin-deep affair. It was superficial because of that extreme severance between government and people which has never existed in European nations within historic times, but which has always existed among the principal races that have professed Moslemism. Nowhere in the Mohammedan world has there ever been what we call a national life, and nowhere do we find in its records any trace of such an intellectual impulse, thrilling through every fibre of the people and begetting prodigious achievements in art, poetry, and philosophy, as was awakened in Europe in the thirteenth century and again in the fifteenth. Under the peculiar form of unlimited material and spiritual despotism exemplified in the caliphate, a few men may discover gases or comment on Aristotle, but no general movement toward political progress or philosophical enquiry is possible. Such a society is rigid and inorganic at bottom, whatever scanty signs of flexibility and life it may show at the surface. There is no better illustration of this, when well considered, than the fact that Moorish civilization remained, politically and intellectually, a mere excrescence in Spain, after having been fastened down over half the country for nearly eight centuries.

But we are in danger of forgetting our main theme, as Dr. Draper seems to do, while we linger with him over these interesting wayside topics. We may perhaps be excused, however, if we have not yet made any very explicit allusion to the 'Conflict between Religion and Science,' because this work seems to be in the main a repetition *en petit* of the 'Intellectual Development of Europe,' and what we have said will apply as well to one as to the other. In the little book, as in the big one, we hear a great deal about the Arabs, and something about Columbus and Galileo, who made men accept sundry truths in the teeth of clerical opposition; and, as before, we float gently down the current of history without being over well-informed as to the precise didactic purpose of our voyage. Here, indeed, even our headings and running-titles do not materially help us, for though we are supposed to be witnessing, or mayhap assisting in, a perennial conflict between "science" and "religion," we are nowhere enlightened as to what the cause or character of this conflict is, nor are we enabled to get a good look at either of the parties to the strife. With regard to "religion" especially are we left in the dark. What this dreadful thing is towards which "science" is always playing the part of Herakles towards the Lernæan Hydra, we are left to gather from the course of the narrative. Yet, in a book with any valid claim to clearsightedness, one would think such a point as this ought to receive very explicit preliminary treatment.

The course of the narrative, however, leaves us in little doubt as to what Dr. Draper means by a conflict between science and religion. When he enlarges on the trite story of Galileo and alludes to the more modern quarrel between the Church and the geologists, and does this in the belief that he is thereby illustrating an antagonism between religion and science, it is obvious that he identifies the cause of the anti-geologists and the persecutors of Galileo with the cause of religion. The word "religion" is to him a symbol which stands for unenlightened bigotry or narrow-minded unwillingness to look facts in the face. Such a conception of religion is common enough, and unhappily a great deal has been done to strengthen it by the very persons to whom the interests of religion are presumed to be a professional care. It is nevertheless a very superficial conception, and no book which is vitiated by it can have much philosophic value. It is simply the crude impression which, in minds unaccustomed to analysis, is left by the fact that theologians and other persons interested in religion are usually alarmed at new scientific truths, and resist them with emotions so highly wrought that they are not only incapable of estimating evidence, but often also have their moral sense impaired, and fight with foul means when fair ones fail. If we reflect carefully on this class of phenomena, we shall see that something besides mere pride of opinion is involved in the struggle. At the bottom of changing theological beliefs there lies something which men perennially value, and for the sake of which they cling to the beliefs as long as possible. That which they value is not itself a matter of belief, but it is a matter of conduct; it is the searching after goodness—after a higher life than the mere satisfaction of individual desires. All animals seek for fulness of life; but in civilized man this craving has acquired a moral significance, and has become a spiritual aspiration; and this emotional tendency, more or less strong in the human race, we call religious feeling or religion. Viewed in this light, religion is not only something that mankind is never likely to get rid of, but it is incomparably the most noble as well as the most useful attribute of humanity.

Now, this emotional prompting toward completeness of life requires, of course, that conduct should be guided, as far as possible, in accordance with a true theory of the relations of man to the world in which he lives. Hence, at any given era the religious feeling will always be found enlisted in behalf of some theory of the universe. At any time, whatever may be their shortcomings in practice, religious men will aim at doing right according to their conceptions of the order of the world. If men's conceptions of the order of nature remained constant, no apparent conflict between their religious feelings and their knowledge need ever arise. But with the first advance in our knowledge of nature the case is altered. New and strange theories are naturally regarded with fear and dislike by persons who have always been accustomed to find the sanction and justification of their emotional prompting towards righteousness in old familiar theories which the new ones are seeking to supplant. Such persons oppose the new doctrine because their engrained mental habits compel them to believe that its establishment will in some way lower men's standard of life, and make them less careful of their spiritual welfare. This is the case, at all events, when theologians oppose scientific conclusions on religious grounds, and not simply from mental dulness or rigidity. And, in so far as it is religious feeling which thus prompts resistance to scientific innovation, it may be said, with some appearance of truth, that there is a conflict between religion and science.

But there must always be two parties to a quarrel, and our statement has to be modified as soon as we consider what the scientific innovator impugns. It is not the emotional prompting towards righteousness, it is not the yearning to live *im Guten, Ganzen, Wahren*, that he seeks to weaken; quite likely he has all this as much at heart as the theologian who vituperates him. Nor is it true that his discoveries, in spite of him, tend to destroy this all-important mental attitude. It would be ridiculous to say that the fate of religious feeling is really involved in the fate of grotesque cosmogonies and theosophies framed in the infancy of men's knowledge of nature; for history shows us quite the contrary. Religious feeling has survived the heliocentric theory and the discoveries of geologists; and it will be none the worse for the establishment of Darwinism. It is the merest truism to say that religion strikes its roots deeper down into human nature than speculative opinion, and is accordingly independent of any

particular set of beliefs. Since, then, the scientific innovator does not, either voluntarily or involuntarily, attack religion, it follows that there can be no such "conflict" as that of which Dr. Draper has undertaken to write the history. The real contest is between one phase of science and another; between the more crude knowledge of yesterday and the less crude knowledge of to-day. The contest, indeed, as presented in history, is simply the measure of the difficulty which men find in exchanging old views for new ones. All along, the practical question has been, whether we should passively acquiesce in the crude generalizations of our ancestors or venture actively to revise them. But as for the religious sentiment, the perennial struggle in which it has been engaged has not been with scientific enquiry, but with the selfish propensities whose tendency is to make men lead the lives of brutes.

The time is at hand when the interests of religion can no longer be supposed to be subserved by obstinate adherence to crude speculations bequeathed to us from pre-scientific antiquity. One good result of the doctrine of evolution, which is now gaining sway in all departments of thought, is the lesson that all our opinions must be held subject to continual revision, and that with none of them can our religious interests be regarded as irretrievably implicated. To any one who has once learned this lesson, a book like Dr. Draper's can be neither interesting nor useful. He who has not learned it can derive little benefit from a work which in its very title keeps open an old and baneful source of error and confusion.

---

*Nero:* an Historical Play. By W. W. Story. (Edinburgh and London: Blackwood & Sons. 1875.)—Mr. Story here offers us another proof of his remarkable versatility and facility. This would be a clever production for any one, but it is especially clever for a man who has found so much besides to do with his imagination. And yet, after all, this long drama is the work of a man who has made a specialty of the picturesque; if Mr. Story were not a distinguished sculptor, we should say it was the work of a painter. It is the picture in his subject that has most taken his fancy, and if a poet is always made up of a painter and a moralist, it is quite the painter that is predominant here. The history of Nero is certainly a subject to fix the attention of a dramatist, overcharged as it is with tragic incident—horror outstripping horror, and deepening, as it does, to an extraordinarily dramatic catastrophe. If, too, the dramatist has lived long in Rome, and has formed the habit of peopling mentally the old scenes with the old figures, and seeing imperial ghosts in the sunny stillness of the Palatine, it is easy to conceive that the figures of Nero and Agrippina, of Poppæa and Tigellinus, may have come to haunt and importune him. Mr. Story has breathed for many a year that densely-weighted Roman air; he has read and re-read his Tacitus and his Suetonius; he has lingered often among the portentous Roman busts in the Vatican and the Capitol, and at last the images of writer and sculptor have become vividly real to him, and he has reproduced them with conviction and energy. He has crowded his stage, laid his hand upon every incident and detail that seemed characteristic, and painted a goodly picture. He has painted a picture, in fact, rather than written a play; and indeed we think that, to the dramatist's second thought, there was no play here to write. The subject, especially as Mr. Story presents it, is too complete a monotony of horror. There is little contrast, little complexity or development, though indeed there is a constant progression—the progression from bad to worse, from one atrocity to another. But it is all bad and all hideous, and there is no dramatic pivot, as it were, on which the story may turn and show us its diverse faces. If Mr. Browning, for instance, had written the play, we should have probably had certain scenes in which Nero would have been made to show us not only the fine fellow (this indeed Mr. Story in some degree represents) but the altogether high-toned and superior gentleman which the pedantic young butcher presumably considered himself to be. Mr. Story has attempted contrast in some of the accompanying figures—in Octavia, Poppæa, and Seneca—in Poppæa very happily; but we think that the dramatic instinct of Racine was the true one when he decided that, in his 'Britannicus,' a single episode of Nero's history was an available subject, but not the whole career. In that masterpiece of the formal and harmonious style there is a certain mixture of elements—a struggle, a conflict. We see the young man passing from good to bad and back again, and the interest of the drama lies in our curiosity as to which side the catastrophe will deposit him on.

Mr. Story has given us rather a panorama of the whole reign—a rolling chronicle. His play is Tacitus and Suetonius piece by piece, in verse and dialogue. He has great precedent for this in Shakspere's dramatizations of Plutarch. 'Antony and Cleopatra' is apparently none the worse play because it takes everything that Plutarch gives it. Of course it takes a great many things besides, and so also does Mr. Story in his 'Nero.' He has not been afraid of giving himself a great deal to do, and he moves easily and gracefully among his multitudinous figures. He has desired to be as complete as, in such a case, poetry can be, and in one or two instances he has not shrunk from a formidable realism. He has gone as far as Tacitus beckoned. He has represented Agrippina, in one scene, striving to regain her lost dominion over her son by the exercise of those charms which she had found potent in cases of an altogether different kind—a scene such as, to the best of our knowledge, no modern dramatist has attempted, and which must look for its mate among the early audacities of the Elizabethans. In his picture of Nero he has been forcible and abundant in color rather than especially subtle—as Nero, compounded of numerous elements, and with his strange jumble of brutality and æsthetics, of the ferocious and the maudlin, might have offered the poet a chance to be. But Mr. Story has wished simply, we take it, to give an effective picture of prodigious, grotesque, fantastic vanity and cruelty, gorging themselves, as it were, upon impurity, and his picture is decidedly effective. Even more so is the portrait of Agrippina—a dramatic interpretation of one of those formidable imperial female busts, the hard, superb great Roman lady, low-browed, inexorable, and insatiable. Mr. Story's phrase is easily vivid and picturesque—it is naturally that of an artist; but we think it is sometimes too diffuse, and that the whole work would have gained by compression and by occasional cancellings on a final revision. The dramatic point is sometimes diluted. For instance, when Nero makes the unsuccessful attempt to put an end to his mother's life by the disaster to her galley off Baiæ, he is shown us waiting on shore for news of the result of his plot. The galley has gone to pieces, but the empress has been rescued. A messenger arrives with this information, and relates that he has seen Agrippina:

> "To you, great Cæsar, her first thought was given.
> 'Go, Agerinus, go,' she said, 'and bear
> This message to my son—His mother lives;
> But bid him calm his fears,—I am not hurt,'" etc.

It would have been much better here, surely, that the message should have simply been, "His mother lives." It would, in the situation, have been more eloquent and portentous. The lines which follow weaken the effect.

---

*Historical Collections of Louisiana and Florida.* By B. F. French. Second Series: Historical Memoirs and Narratives, 1527-1702. (New York: Albert Mason. 1875.)—We have been long in reaching this book, which appeared some months ago, and now that we have examined it we regret that we cannot praise it without reserve. In spite of its defects, every one who already possesses Mr. French's former series bearing the same title (New York: J. Sabin & Sons, 1869), will wish to own this volume also; and Mr. Francis Parkman's many admirers will be glad to have in this shape, sometimes translated and sometimes in the original French or Spanish, documents on which he has relied in writing the history of the French in America. Thus, for what concerns La Salle, Mr. French gives versions of the memoir which the explorer addressed to Monseigneur de Seignelay on his discoveries in 1678, and of the *procès-verbal* relating to his taking possession of Louisiana at the mouth of the Mississippi in April, 1682. We have also, for the first time in English and in print, the narrative of Iberville's colonizing expeditions to Louisiana, with sundry companion-pieces. The rest, rather more than half the book, pertains to Florida, and is mainly occupied with the romantic episode of the attempted Huguenot settlement of Jean de Ribault. The narrative of his first voyage is followed by a memoir of the fatal expedition of Menendez, and another (in the old French) of the brave Captain Gourgues, who answered the Spanish butcher's "I do not this as unto Frenchmen, but as unto Lutherans" with "Je ne faicts cecy comme à Espaignolz, n'y comme à Marannes; mais comme à traistres, volleurs et meurtriers"—or, as Hakluyt has phrased it: "I do not this as unto Spaniards, nor as unto mariners [*qu.* sons of Moors?], but as unto traitors, robbers, and murtherers."

As a translator, Mr. French is in no danger of becoming a classic like Hakluyt. His style is slovenly in the extreme. In a foot-note, on p. 45, we read: "Father Anastasius Douay Recollect—we know but little of his history previous to his coming to Louisiana with M. de la Salle in 1684, and who (*sic*) returned to France with M. Joutel, the historian of that expedition, after the tragical death of Sieur de la Salle." Here we miss the point of punctuation after Douay—a serious omission, since Recollect is printed in small capitals, as if a proper name—and are perplexed by the extraordinary "and who," which is a characteristic construction with Mr. French, and occurs constantly. We cite a second instance where the sense is hopelessly obscured by it (note, p. 13):

"The English assert that Colonel Wood, of Virginia, spent at different times, from 1654 to 1664, several years in the discovery of the Mississippi

River, which is not improbable, as Daniel Cox, in his account of Louisiana, *and who* sent an expedition there of two ships-of-war to take possession, in 1698, which he claimed as a grant from the English Government, and described in his work on Louisiana, from memoirs and journals kept by persons who had been sent there, which is not improbable."

Sometimes a bracketing-out of Mr. French's relative pronouns restores the true connection of his involved sentences, as (p. 119) :

"By a secret treaty of Nov. 3, 1762, signed the same day on which the preliminaries of peace between Great Britain, France, and Spain were signed, [in which] France ceded to Spain 'all the country known under the name of Louisiana, as also New Orleans and the island on which it is situated'—that is, so much of Louisiana as had not been agreed to be transferred by France to Great Britain."

On p. 124 (note), we are told of the Normans that they planted themselves "in Northeastern America, where . . . . " they "became for many years more influential than all their rivals ; and, for a long time, was (*sic*) the battle-ground for the conflicting claims of France and England." In this case the relative adverb was doubtless felt to be the proper subject of *was*. We might cite other examples of this writer's carelessness, which is certainly without excuse. A corresponding want of clearness is manifest in the arrangement of his pieces, and for this he makes no compensation in an index. Even the table of contents is put at the end. Externally, the typography is neat and tasteful.

---

*Antonio Allegri da Correggio.* From the German of Dr. Julius Meyer, Director of the Royal Gallery, Berlin. Edited and with an Introduction by Mrs. Charles Heaton. (New York : Macmillan & Co.)—This handsome volume, uniform with the Albrecht Dürer and Leonardo of the same editor, will not be overlooked by possessors of those biographies ; like them it has a seasonable attractiveness. The critical value of the work here done into English (by Miss Spencer) is what least entitles it to preservation ; it embodies all of the wonderfully scanty results of research into the life and technical training of Correggio, and it enumerates and describes the works known to be his or attributed to him. Mrs. Heaton does comparatively little to reinforce Dr. Meyer either in his criticism or his facts, and her Introduction would perhaps hardly be missed, but her notes are worth having, as they supplement or correct the original. By the way, we notice on page xix. that Mrs. Heaton speaks of Leonardo's influence as "paramount at the beginning of the *fifteenth* century"—he was born in 1452. The illustrations which she brings together are mostly photographs from line-engravings after Correggio, with the shadows intensified by we know not what process, as if to imitate the chiaroscuro of the canvas ; and this is measurably successful when the print is not held too near the eye. The other illustrations are carbon facsimiles of drawings in English collections. Though there is no authentic portrait of Correggio, a supposed portrait is reproduced, for what reason it would be difficult to say.

# Fine Arts.

## VON BÜLOW.

DR. VON BÜLOW'S way in this country was well prepared before him—discreetly, without exaggeration, but with enough exaltation to excite the curiosity of such musical people as were not familiar with his reputation ; so that when he appeared in Boston his audience knew that he was a person to be listened to with deferential attention. This was wise ; for neither his person nor his manner is commanding ; and his style of playing is not such as to impress itself strongly upon an average audience. The folk of Modern Athens decided that nothing too much had been told of him ; and they were right, as they not unfrequently are. Von Bülow is not merely a dexterous and finished pianoforte player ; he is a musician of distinguished ability, a thoughtful and highly cultivated man, whose special means of self-manifestation is the pianoforte. He would have made his mark in any department of music to which he might have devoted himself, and it is safe to say that he would have attained a more than respectable position in any other profession which was at all suited to his personal tastes and peculiar powers. In this he is singular among musicians, and particularly among musicians who are only artists ; for these are generally, if not always, limited by their art ; they live *for* music as well as by music. Von Bülow is a fine example of that rare creature, the intellectual musician. He shows this in every way : in his face, in his personal bearing, in conversation, as well as at his instrument. His style indicates thought rather than emotion ; it is the exponent of discipline rather than of impulse. The impression that he produces is that of completeness, of plan and conscious purpose ; of a focus of well-directed means in a bright and beaming end.

Von Bülow's performance—we mean more than his style—is the result of discipline. Discipline appears in it from beginning to end. And by discipline we do not mean merely practice. Of thoroughly practised pianists we have heard not a few ; men who had literally at their fingers' ends all the resources of the instrument ; to whom the complete mastery of the key-board had become a second nature, and to whom the perfect execution of any music possible to the instrument was as much a matter of course as walking or breathing. But all this is possible without the discipline that appears in every performance of Von Bülow, let it be of the lightest possible character. His performance indicates something like this style of preparation: the composition is taken, studied as a whole, then divided into grand divisions, the relation of which to each other is determined ; these divisions are again divided, and the relation of the new parts as to importance and signification is determined ; these again are resolved into phrases, the phrases into groups, the groups into single notes ; and each division, each phrase, each group, and last, we may literally say each note, is assigned its peculiar and exact weight and prominence. To the working out and exposition of this appreciation, at once large and minute, the performer then brings his powers of perfect and finished execution. The result is a thoroughness and completeness which place the hearer simply in a receptive position. We have only to listen and to accept ; and it is not until after the performance is over that we can question with ourselves whether we are satisfied or not, and whether our pleasure was equal to our admiration. This style of discipline, this analytical thoroughness, is almost distinctively German. It pervades all German work of modern days. Von Bülow owes his distinctive eminence to the same spirit and the same purpose which have made Germany the leading nation of the present day in science and in literature, as well as in arms and in statesmanship ; and that spirit and purpose we expressed in the one word, discipline. The Germans have taken their present position because they are the most thoroughly disciplined people in the world.

As to Von Bülow's execution, there is little to be said about it, for the reason that it is as nearly perfect as anything can be in a world in which nothing is absolutely perfect. In appreciating an artist of Von Bülow's grade, one does not go into the question of scales and double octaves and clear articulation. All that may be assumed. In the matter of intonation a pianist is free ; that is cared for by the pianoforte-maker and the tuner ; and if his keys and hammers work well he is sure of his notes. But his touch is his own. That marvellous and inexplicable expression of the individual man—more easily comprehended where the finger actually touches the string or the lip the mouthpiece, but which even in the pianoforte is transmitted by a wooden lever to a loosely-playing hammer—is something that cannot be acquired. It may be improved by practice, but it cannot be imparted by teaching, and all the discipline in the world cannot make it better or worse. It is a gift of nature. And here, with all the richness of his gifts and his acquirements, Von Bülow leaves something to be desired. His touch has all the qualities that we could ask for but one. It is clear, firm, delicate, of a liquid clearness which, at times, is like the dropping of water in a well, always nervous, vigorous enough upon demand and yet as light as the sweep of a swallow's wing. But it lacks sweetness, fulness, and, above all, it lacks that quality which makes the tone vibrate in the heart of the hearer, and for which there is no other word than sympathetic. We are lost in admiration, but we sit unmoved. We are startled into applause by a perfection of conception and execution which rise into a blaze of splendor, but it is a blaze without warmth, and we turn away untouched. The depths of our souls lie untroubled ; we do not pay the great homage of silence. In a word, Von Bülow's style is cold—that is, as cold as a style so

nervous can be. It is not a coldness which proceeds from his lack of feeling, but from his lack of an adequate means of expression—a sympathetic touch; although, again, it *is* somewhat dependent upon the attitude which he assumes towards his music. His performance is intellectual, not emotional. It is not merely a perfect and admirable mechanical performance, like that of most cold pianists. It is far above that. But it seems as if the very discipline of which it is the result—the clear, precise, predetermined, and almost preordained relation of phrase to phrase and note to note—were incompatible with that expression of feeling which, after all, is the one thing needful to the highest enjoyment of music.

Apart from this, however, Von Bülow leaves nothing to be desired. Whether he plays Beethoven or Bach, or flashes through the somewhat unmeaning intricacies of Henselt or of Liszt, he leaves us nothing to say but to express our admiration of his perfect conception and perfect rendering of the intention of the composer. The simplicity of his manner is in itself most admirable. He comes before us in his precise way, with his crush-hat and his decoration, and, bowing precisely, he sits down and at once begins to play; and as he plays he spends no time or force and diverts no attention by unmeaning flourishes. He makes no "damnable faces," but begins, and as he begins he goes on, seeking only to convey to us the meaning of the composition that he carries in his intellectual head. There is no waste of power or of nervous energy in superfluous motion; all his energy is directed to one object. He has no grand airs or imposing gestures, and he plays as anybody might play, like a simple gentleman, an amateur; and at times, in a very amateurish way, he does not disdain to seem to be picking out with his eyes as well as with his fingers the keys which he must strike with just that predetermined force that will produce the exact quantity and quality of tone that his study of the passage has satisfied him is required to express the composer's intention. And with it all we are so sure of him. We acknowledge, and, more, we feel, his perfect mastery of his instrument, and of his music, and of himself. We have no fear that he will for a moment be beside himself, and, snatching at a grace beyond the reach of art, perhaps fail in its attainment. For this reason, and because of his great acquirement as a musician, and his perfect accomplishment as an executant, it is difficult to say in what style of music he most excels. For in all there is manifested the same clear conception of the requirement of his music, and the same ability to meet those requirements, however great they may be. His audiences, composed largely of amateur pianists, may find their greatest satisfaction in his performance of Liszt's music and the like; but those who go to hear music merely for music's sake will find their highest pleasure in his performance of Beethoven's concertos and sonatas, or in his marvellously clear delivery of Bach's fugues.

This series of Von Bülow concerts must be regarded as a musical event of no small importance. They certainly cannot fail to have a very refining and elevating effect upon the taste of our multitude of amateur pianists, who could not have a finer model placed before them than this eminent German master of their instrument. Nor would a notice of these concerts be justly closed without a recognition of the ability which that highly-accomplished musician and violinist, Dr. Damrosch, has shown in the quick gathering and training and conducting of the orchestra, whose part in them is hardly inferior to that of Von Bülow himself.

As the Warrior's Weapon and the Wizard's Wand. As Stay, as Stimulus, and as Scourge. Translated and adapted from the French of Anthony Real (Fernand Michel). 1 vol. square 16mo, extra cloth, $1 50.

"Wrought for a Staff, wrought for a Rod."
—SWINBURNE *Atalanta in Calydon.*

The above work condenses in a lively narrative form a most astonishing mass of curious and recondite information in regard to the subject of which it treats. From the bludgeon of Cain to the truncheon of the Marshals of France, from the budding rod of Aaron to the blazing cane of M. de Balzac, the stick in all its relations with man, since first he meddled with the Tree of Knowledge of Good and Evil, is shown here to have played a far greater part in history than is commonly imagined. If it has been the instrument of justice, it has been the tool also of luxury. It has ministered to man, its maker, pleasure as well as pain, and has served for his support as well as for his subjugation. The mysteries in which it has figured are some of them revealed and others of them hinted in these most entertaining and instructive pages, for between the days of the Society of the Assassins in the East, and those of the Society of the Aphrodites in the West, the stick has been made the pivot of many secret associations, all of them interesting to the student of human morals, but not all of them wisely to be treated of before the general public. The late Mr. Buckle especially collected on this subject some most astounding particulars of social history, which he did not live to handle in his own inimitable way, but of which an adequate inkling is here afforded to the serious and intelligent reader.

LECTURES

*Delivered in America*

BY CHARLES KINGSLEY,

Late Canon of Westminster, etc.

*Edited by Mrs. Kingsley.* 12mo, *toned paper, cloth, price* $1 25.

CONTENTS: Westminster Abbey—The Stage as it Once Was—The First Discovery of America—The Servant of the Lord—Ancient Civilization.

These lectures, delivered here so short a time before the author's death, possess an unusual interest. Those to whom they are entirely fresh have the assurance of the pleasure that Canon Kingsley's writing always gives; while to those privileged to hear the words from the author's own lips, they will be doubly welcome from their associations as well. The subjects are of wide and lasting interest.

". . . This is the outward dress of the lecture which the reader will find below, and reading it he will see no cause to wonder how the audience bound by the spell of the eloquent thought and tender feeling, listened all the time, and could have listened twice as long."—*N. Y. Tribune's Report of one of the lectures.*

"The first attempt at a full and connected history of the whole war."—*The Nation, N. Y.*

HISTORY

OF THE

*Civil War in America.*

BY THE COMTE DE PARIS.

Translated with the approval of the author by Louis F. Tasistro. Edited by Henry Coppée, LL.D. Volume I (embracing without abridgment the first two volumes of the French edition). With Maps faithfully engraved from the originals, and printed in three colors. 8vo, cloth, $3 50; sheep, library style, $4 50; half-Turkey morocco, $6.

To be followed shortly by Volume II., and the others as they issue in France. To be completed in four volumes.

"If those which are to succeed it are composed in the same clear and comprehensive manner, we shall undoubtedly have the best history yet written of the military operations of the war. The list of kindred works is still meagre. . . . Far above all these (Pollard's, General Johnston's, Swinton's, Badeau's, De Trobriand's, Headley's, Greeley's, Draper's, Col. Fletcher's, Col Hamley's, Col. Chesney's)—in pretension, and so far in accomplishment, stands the work of the Comte de Paris, the first attempt at a full and connected military history of the whole war."—*The Nation.*

"It will not be likely to disappoint the American public. It is the production of an intelligent European, of clear and comprehensive views, familiar with the details of the military profession, with uncommon facility of language and power of description, free from all personal and partisan biases, and with the habit of philosophic calmness and impartiality."—*N. Y. Tribune.*

"It becomes continually clearer that this is destined to be the generally-received history of the war. It will be deservedly so, for the author, by virtue of being a foreigner, has an impartiality which it would be hard for one of us to acquire; he has a satisfactory knowledge of both the great principles and the *minutiæ* of the great struggle, and he spares no pains in search of thoroughness and accuracy. More than this, he is so completely master of his subject that he makes clear the most complicated campaigns, and he tells his story in the most lucid way."—*Atlantic Monthly.*

"The most finished careful, and dispassionate review of the whole contest which has yet appeared, or which is likely to appear, in this generation. . . . He has done for us in war what De Tocqueville did for us in peace."—*Springfield Republican.*

J. H. COATES & CO., Publishers,

PHILADELPHIA.

*Messrs. Roberts Brothers*

PUBLISH THIS WEEK:

*THE ÆNEIDS OF VIRGIL.* Done into English Verse by William Morris, author of 'The Earthly Paradise.' Crown 8vo, cloth, gilt top, price $3 50.

*DANTE AND HIS CIRCLE:* With the Italian Poets preceding him: 1100–1200–1300. A Collection of Lyrics. Edited and translated in the Original Metres by Dante Gabriel Rossetti. Crown 8vo, cloth, gilt top, price $3 50.

*THE SYLVAN YEAR.* Leaves from the Note-Book of Raoul Dubois. By Philip Gilbert Hamerton. With Twenty Etchings by the Author and Other Artists. Small quarto, beautifully bound in illuminated cloth, gilt edges, price $6.

THE JEAN INGELOW HOLIDAY BOOK.

*The Shepherd Lady*

By Jean Ingelow. With other poems not included in her poetical works. 'The Shepherd Lady' is a poem symbolical of the Christian Church. The drawings to illustrate it were made by Arthur Hughes, of London, under Miss Ingelow's supervision. Other designs by Miss Hallock, Darley, Sol Fytinge, Mitchell, Shepherd, Perkins, with a steel-engraved likeness of Miss Ingelow, combine to make one of the most artistic and beautiful of Presentation Books. One royal 8vo with red line border, bound in cloth, black and gilt lettered, price $4 50.

*AUTOBIOGRAPHY OF MRS.* Fletcher. With Letters and other Family Memorials. Edited by the Survivor of her Family. One handsome 8vo, with steel engraved portraits of Mrs. Fletcher at the ages of fifteen and eighty. Price $2 50.

*From the Literary World.*

"Such books as this refresh one's confidence in human nature, cast a new fragrance about youth, and work rosy and alluring colors into the sunset landscape that confronts us all. It is the story of a long, beautiful, and useful life—of a woman who found her own happiness in making others happy, who lived the idol of all who knew her and died, leaving to those who mourned for her the precious legacy of a lovely example. A more beautiful character we have never known in real life or in fiction. Her autobiography is well worthy to rank with Mrs. Somerville's 'Memoirs,' a compliment that few books deserve."

Sold everywhere by all booksellers. Mailed, post-paid, by the publishers,

ROBERTS BROTHERS, BOSTON.

*Ginn Brothers, Boston.*

*WHITON'S SELECT ORATIONS* of Lysias. Comprising the Defence of Mantitheus, the Oration against Eratosthenes, the Reply to "The Overthrow of the Democracy," and the Oration on account of the Olive-Trunk; with Introductions, Notes, and References to Goodwin's and Hadley's Greek Grammars, and Goodwin's Greek Moods and Tenses. By James Morris Whiton, Ph.D.

*SELECTIONS FROM BURKE,* Bacon, Webster. By Dr. Hudson.

*ALLEN & GREENOUGH'S LATIN* Series.

*R. E. MOORE,*

ART ROOMS,

31 Union Square, New York.

Gallery of American Paintings, by S. R. Gifford McEntee, Cropsey, E. Johnson, Bierstadt, Bellows, Brown, Wyant, Wm. Hart, Casilear, Inness, Moran, Lambdin, Kensett, De Haas, and Jas. Hart, for sale.

*Protestant Episcopal Church.*

Full and authentic information in regard to this Church (and the Church of England), together with its representative and best thought, and much valuable literary and general reading, can be found in the CHURCHMAN, a 32-page weekly, now in its thirty-first year. Single copy, ten cents; three months, $1; one year, $4. To Clergymen, $3.

Address 713 Broadway, New York, or Hartford, Conn.

# The Nation.

*NEW YORK, THURSDAY, DECEMBER 2, 1875.*

## The Week.

THE publication of General Schenck's testimony in the Emma Mine suit and his contract with Park shows that the character of the transaction has not been at all misrepresented. The facts are simply these: He was one day introduced to Park, of whom he knew nothing before. Park immediately begged him to become a stockholder and director of the Emma Mine, about which he knew even less than he did about Park. Schenck had himself no money to invest. Park immediately produced his own purse, and lent Mr. Schenck the sum of $50,000 (or lent him stock which could have been sold for more than that sum). Even this was not enough, for Park added a guarantee of dividends at eighteen per cent., and, to make all secure, an engagement to take the stock off Schenck's hands at par, provided that a tender of the par value of the stock should, whether accepted or not, release Park from his agreement as to dividends. Schenck now says that he has lost a great deal of money by the operation, and still has the stock on his hands. But this fact makes no difference. He had a contract with Park which would have made him, had he so chosen, absolutely safe. He was entitled to the eighteen per cent. without any risk to his property whatever, for he put no property whatever into the concern, and by taking the par value of the stock when Park actually offered it he would have merely made a nice little sum of money without any risk. His case is, indeed, a solitary instance of a mining investment which was so arranged as to have no dependence whatever on the character or product of the mine. Now, people like Park do not make such bargains for nothing. He did not lend General Schenck $50,000, and at the same time agree that he should get eighteen per cent. on the money, without an equivalent which, in his opinion, was worth what he gave. The equivalent was the name of the Minister, and any other explanation is not only impossible, but shows the most astonishing impudence or ignorance in any one who advances it.

---

There are two versions afloat now of the nature of Mr. Chandler's changes in the Department of the Interior. According to one, to which we have inclined ourselves, he is doing what the politicians call "reorganizing the party," by dismissing all persons who are not likely to be useful in the great struggle in defence of "equal rights for all" which he thinks will take place next year. According to the other, he is simply breaking up the rings of corrupt fellows which were formed in the Department under Mr. Delano, the accounts of whose operations, as published by Mr. Chandler's friends, are really shocking. But then we have the authority of the very highest officer in the Government for saying that Mr. Delano's administration was in all respects pure and efficient, and that the charges made against it were newspaper stories, got up to gratify the malice of venal scribblers, so that the good citizen is placed on the horns of a dilemma. Either Chandler is a "bad man," or the Presidential letter to Delano was no better than a "newsy paragraph" in a "breezy little sheet." However, we think, in spite of the generally low opinion entertained of Mr. Chandler, there will be no disposition in any quarter to deny him credit for any good he does, and there is a strong disposition to believe that a great many removals were called for in the Department for better reasons than the good of the party.

---

The Comptroller of the Currency reports a decrease in bank-note circulation since January 14 (the date of the passage of the Resumption Bill) of $6,274,548, and the amount of legal-tender notes "permanently retired" under the act as $8,763,756—the act having thus far worked as a measure of contraction. The large amount of currency retired is, we believe, explained by the fact that the Secretary of the Treasury has construed the act as compelling him to withdraw greenbacks as he issues bank-notes in the proportion of 4 to 5, independently of the question whether banks are returning their circulation to the Treasury on account of the dulness of the times. In other words, while some banks have been voluntarily returning circulation to the Treasury they could not use, the Secretary has been retiring currency against bank-notes issued to other banks which wanted circulation. The whole subject will no doubt be made plainer by the report of the Secretary of the Treasury.

---

Mr. Smith's Indian report is a cheerful document, in which he calls attention to the generally encouraging tenor of the Agents' reports, and declares that they prove conclusively that the civilization of the Indians "is not only entirely practicable, but is fairly under way." As the reports of the Agents are not published, we are unable to say how far this may be borne out by the facts, and Mr. Smith himself does not give any to show the exact level which Indian civilization has reached. He says that not less than a thousand miners, "with the number rapidly increasing," have made their way into the Sioux country in the face of the army, and that an emigrant society has been formed, laws and regulations adopted, and claims staked out, though the negotiations for the purchase of the territory have as yet come to nothing. The removal of the captives of the Kiowa, Comanche, and Cheyenne tribes to some portion of the Indian Territory where they could be civilized has not been accomplished, but seventy of the worst of them have been sent to Florida Fort—a kind of treatment which has had a "most happy effect" upon the remainder. Mr. Smith thinks the transfer of the whole Bureau to the War Department would be a mistake, because the Indian needs to be surrounded by the gentle influences of peace, and not by "men in uniform," and quotes with approval the report of the Peace Commission in 1868 recommending Congress to pass a law fixing a day on which all the Indian offices should become at one stroke vacant, so that those who have been proved unfit will find themselves removed "without an opportunity to direct attention from their own unworthiness by professions of party"—a recommendation, he says, which, though not acted upon by Congress, was virtually adopted by the President in "requiring the nomination of all Indian Agents to come from the several religious bodies of the country." The transfer of the purchase of goods to the War Department he approves.

---

Major-General Schofield has made a report on the condition of affairs in the military division of the Pacific, in which he takes a less roseate view of the Indian question than does Commissioner Smith. He gives as an illustration of the present system the case of the Arizona Indians. A few years ago, he says, they were in a wild state and hostile. Life and property were everywhere insecure. The President put the whole matter in the hands of a division commander, with full powers. A well-matured plan was adopted and instructions issued. The result was that all the Indians were subdued and placed on their several reservations. And now, he says, "all this must be undone by the Indian Department as soon as they can get control." He asserts that the present system is substantially a see-saw between the Indian Department and the army—the Department first "civilizing" the Indians into a war, and the army then being called in to exterminate enough of them to render the remainder sufficiently peaceable to be turned over again to the contractors and agents; and declares that though, in the interest of the army itself, he has always been opposed to the transfer of the Indians to its care, he has been forced to the conclusion that the

transfer has become a public necessity; and suggests that military management will give a greater opportunity for Christian missionaries to civilize and instruct; and thinks it highly advisable that these "worthy philanthropists be relieved from the responsibility and contamination of more worldly matters"—a recommendation which Smith and Saville, in their retirement, will no doubt piously echo.

Several schemes are coming before Congress this winter in the hope of getting money appropriated for their benefit, and among others that of the Centennial Commission. General Hawley made a speech on Monday at the Stock Exchange, in which he stated that $1,500,000 are needed to open the Exhibition in May, and he expressed the opinion that the "burden would be distributed fairly" if Congress should appropriate the needed sum. The application made last year was defeated on the ground that the act of incorporation distinctly provided that the Government should in no way become financially responsible for the undertaking, and the results show that the refusal of Congress had a most excellent effect, since it convinced the managers that they must carry the project through by their own efforts. During the past year they have worked hard, and now—in the grounds, in the number of applications for space from abroad, and in the arrangements for the convenience of spectators and exhibitors—they have every promise of success. Yet it cannot be denied that the Exhibition has still a local character; nearly all the money has been subscribed either by the State of Pennsylvania or by Philadelphia, and little enthusiasm has been shown for it in other parts of the country. This million and a half will no doubt be raised whether Congress appropriates the sum or not, and there are many objections to a tax for the purpose. One of them is that the Centennial appropriation will be used as a cover for many other schemes—for instance, for the Texas-Pacific subsidy—and it will be easier for Congress to refuse all than to discriminate.

The Governor of Connecticut has made a very good choice in selecting Mr. James E. English as Mr. O. S. Ferry's successor. Mr. English is one of the Connecticut War-Democrats, a man of large property, and, like his predecessor, "sound" on the money question. We wish we could say as much of Senator Ferry of Michigan, whose opinions on finance have become, by the death of Mr. Wilson, accidentally important. He has been "interviewed" by the *Herald*, and declares that he is not an inflationist. We should be very glad of this, but we feared on seeing the announcement that it was too good to be true, and so it proves to be. Mr. Ferry is, to be sure, in favor of a return to specie payments, but he has also supported most of the measures which the inflationists have voted for. He thinks that the currency ought to be limited for ever to a maximum of $800,000,000, and the country ought to be allowed to "grow up" to specie payments; he thinks the Resumption Bill of last year was in a certain sense a "triumph for his own opinions"; he would like to have had greenbacks substituted for bank-notes uniformly, and paper made receivable at the Custom-house for duties; thinks that the contraction of the currency provided for by the Resumption Bill is counterbalanced and rendered harmless by the correlative increase of bank-note circulation which must accompany it; declares that he was in favor last winter of putting off the date for resumption "as long as possible." This does not perhaps prove that Senator Ferry is an inflationist who will "roar for soft-money" this winter, but it does show that he knows little or nothing about the subject, and, like so many other politicians at Washington, is possessed by the delusion that specie payments can be reached by some other process than by redeeming the promises of the Government in coin.

The latest plan proposed by the Anti-Tammany party for the restoration of pure and honest government in New York is the abrogation of the charter of the Tammany Association. As the only benefit the Association derives from the charter is the power of holding a small amount of real estate, the fondness with which some of our contemporaries are dwelling on this scheme has something very curious about it. The withdrawal of the charter would not kill the Association, or, indeed, injure it materially. The members would get somebody to hold their property in trust, and continue their sinful ways just as before—electing delegates, holding "secret meetings," and pulling wires and making bad nominations and setting up bosses in the old style. Does it not occur to the *Evening Post*, for example, that the strength of Tammany lies not in its charter but in the number of votes it controls? By the bye, why do we not hear more from the "reformers" about John Morrissey? What work of purification is that modest Christian gentleman now engaged in? We hope he does not often see Kelly—for the mere sight of that bad man must pain him. He must often ask himself: "How can *any* man be so bad as Kelly?"

The liveliest newspaper war that has raged in this city for many years has been going on between the *Times* and a firm called Goodsell Bros., who publish an illustrated paper called the *Graphic* and an insurance paper called the *Spectator*, through which last they are charged with levying blackmail on insurance companies. The *Times*, which recently promised us to prove the editor of the *Tribune* a "liar and a cheat," but apparently gave it up in disgust, has undertaken to "expose" the Goodsells, and to "expose" their lawyers, and "expose" almost everybody who meddled in the quarrel. The Goodsells, nothing daunted, replied by caricatures in their "low sheet," and the *Times* every day called on all sneaking officers of insurance companies to stand by and see what was going to happen to the Goodsells, and observe how little afraid of them it was, and to take heart and defy the Goodsells; and the Goodsells, in their turn, made ridiculous pictures of the editor of the *Times*; and then the new insurance companies wrote to the *Times* to bid the Goodsells come on, and the *Times* threatened to publish any insurance officers who advertised in the *Spectator* as poltroons and evil-doers; and the whole town got excited over the fight, which will probably end in proving a prodigious advertisement for the *Graphic*, the principal engine of the guilty firm. The Goodsells have begun a suit against the editor and the publisher of the *Times*, but it is questionable whether they will make as much by this procedure as by their blackmail operations in the *Spectator*, whatever that may amount to.

In the financial world the week has been notable for an advance in London in the price of British consols to the highest figures attained since 1860. This advance to 95¾ was maintained only for one day; the next brought the announcement that the British Government had purchased from the Khedive of Egypt his shares in the Suez Canal Company, the price paid having been £4,000,000. This news caused a decline of about 1 per cent. for two reasons: first, on account of the addition of £4,000,000 to the British funds; and second, and chiefly, because of the political complications possible from such a movement on the part of one of the leading powers of Europe. From the extreme decline of 1 per cent. there was a recovery of ½, part of which, however, was subsequently lost. There were no other movements of special interest in the London market, money having continued in unhealthy abundance. Our securities continue to grow in favor in Europe, and private advices more than quotations warrant the belief that investors, particularly in England, are transferring their money from the securities of Eastern and South American governments to United States bonds.

Wall Street was tranquil until the latter part of the week, when both the gold and stock speculations were awakened into activity, the former by reason of Washington despatches respecting Cuba, and the latter on account of the U. S. Supreme Court decision in the case of the Union Pacific Railroad against the Government. The despatches in regard to Cuba have mysteriously hinted that our Government is preparing for war in various ways, and that the President, in his Message, will take a menacing attitude. Whether these despatches are more than the cunning contrivances

of gold speculators remains to be seen. The decision of the Supreme Court clears away doubts which have surrounded the securities of all the Pacific roads, and this is shown by the advance in the bonds and stocks of these companies, part of which advance was due to speculative manipulations. The upward tendency of the stock speculation was turned before the close of the week by the "war news" and various other rumors of a disquieting character. The enlarged volume of business at the Stock Exchange, together with the drain on the New York banks for currency, had the effect of advancing the rate for demand loans to 5 per cent. The gold value of one hundred dollars in greenbacks has varied during the week between $87 62 and $86 39.

---

The opinion of the Supreme Court in the Union Pacific case is so clear that there will fortunately be little room for criticism and none for suspicion. The claim advanced by the United States was its right to set off the interest paid on the bonds issued in aid of the road against half the compensation due the road for Government transportation. As to the other half, there is no dispute that the Government has the right to retain it. Practically, therefore, the matter at issue was, as the Court says, whether "the Company is required to pay the interest" (on these bonds) "before the maturity of the principal." The decision of the Court in favor of the Company puts off the repayment of both principal and interest to the same time—the maturity of the bonds, or some time about the close of the present century. The principles of law on which the decision is founded are so familiar that it is difficult to understand what the technical case for the Government could have been supposed to be. The Court were of course obliged to decide it not upon any general right of set-off, but upon the terms of the contract between the United States and the road contained in the acts of Congress, and these acts had to be looked at in view of all the surrounding circumstances—the general belief that the road was a necessity to the Government for military and other reasons; that it could not be built by private capital; that it was needed to develop the Western country and to unite the Atlantic and Pacific slopes; and, as the Court says, the fact that doubts now exist as to the necessity of the Government aid can have no weight in determining the question, for "Congress acted with reference to a state of things supposed to exist at the time, and no idea can be derived in the construction of legislation from the consideration that the theory on which it proceeded turned out not to be correct."

---

While the law of the matter seems to be clear enough, there is little doubt that the equities of the suit are all the other way, and that the United States, which originally had ample means to protect its advances to the road, has, by the neglect or something worse of Congress, lost a great part of the value of its security. The original acts with regard to the road allowed the Government to retain the whole compensation due to the corporation for services, and made the bonds a first-mortgage lien. By the amendatory act of 1864, however, not only was the land-grant doubled, but the Government lien was made a second instead of a first mortgage, and a provision was inserted that only one-half of the amount due for transportation should be retained by the Government. Notwithstanding all this liberality, the managers of the road got Congress involved in a disgraceful scandal with regard to its construction, which probably did more to impair the reputation of the Government than any one thing that has happened since the passage of the Legal-tender Act. These circumstances the public can take into consideration, though the Court could not.

---

The Conservative Ministry in England has performed a veritable *coup de théâtre* by the purchase from the Khedive of his 177 of the 400 shares of the Suez Canal. The story goes that they were first offered to the French Government, but, owing to some small difficulty about raising the money, the offer was not at once accepted, made then to England, it was taken on the spot. It is rendered all the more remarkable by the fact that England bitterly opposed the construction of the Canal, while France supported it, and it was largely made by French capital. It has cost $86,807,882, and when opened, in 1869, it was supposed it would not begin to pay its expenses before 1874, but, in reality, it not only paid them in 1872, but made in that year a profit of $414,255, since which it has been gaining steadily. The opposition of England to its construction was due to Lord Palmerston's belief that it would tend more to help the French or Russians in attacking India than to help the English in defending it—a belief which his successors have perhaps not wholly abandoned, and which, therefore, has led them to seize the first opportunity of getting hold of it. British merchant vessels, as might have been expected, are already the best customers of the Canal, and will probably continue to be so, so that it is not unnatural on commercial grounds that the management of it should fall into British hands, but there will probably be a strenuous attempt now made by France to "go halves," the success or failure of which will probably depend on the temper of the English public. At present the Government seems to have made a great hit, and to have roused as no Government has done of late years the old martial temper of the nation, and the desire, now so long kept down, of having a say in European politics. The Khedive was to get no interest on his stock for twenty-five years from 1869, but is, it is said, to pay England five per cent. during that period.

---

The unfortunate captive who is languishing in the British bastille known as Dartmoor Prison, has been writing some letters to his friends and patrons, Mr. and Mrs. Onslow, which are supposed to throw an interesting if not startling light on the question of his identity. The governor of the prison, with the brutality which generally marks the British governor of prisons, carefully erased some of the most important parts of the letters, which, no doubt, had they been published, would have brought out in strong relief the odious character of the conspiracy which now detains the rightful baronet behind the prison-bars; but enough remains even of these officially-mutilated documents to show that Sir Roger Tichborne, as he calls himself in his letter to Mr. Onslow, or Thomas Castro, as he romantically signs his name in addressing Mrs. Onslow, is by no means unoccupied during his enforced leisure, but is devoting a good deal of his time to perfecting himself in certain branches of learning which he had during his travels sadly neglected. It will be remembered that during the trial of the Tichborne case, notwithstanding the fact that Sir Roger himself was proved to have had a good classical education, and to have been as familiar with the French as with the English tongue, the Claimant had no little difficulty in remembering the meaning of any French word, and made some translations from the Latin which caused a great deal of unfair amusement among the aristocracy; though his translation of *Laus deo semper* into "the laws of God for ever" seemed to a very large number of people unacquainted with the language a very successful effort. Since his imprisonment, however, he has improved his opportunities for "culture," and appears now to have got back to just the point which he had reached a generation ago, when he left his native land. Not only are his letters written in English of the purest sort, bearing no resemblance to the style of the famous maxim he was believed to have composed relating to the rights and duties of that class in the community which has "plenty brains, no money"; but his Latin, too, is classical to that degree that he concludes a paragraph (from which, we are sorry to say, the governor has erased a good deal) by the well-known line, *Emollit mores, nec sinit esse feros.* Altogether, it begins to look as if, on his liberation, his education would have progressed so far that he would have little difficulty in proving his identity and upsetting the base conspiracy which has ruined his fortunes. We wish we could believe that Tweed were as well employed as Sir Roger, but we fear he will never be able to quote Ovid.

## THE SUPREME COURT AS A STEPPING-STONE TO SOMETHING ELSE.

CHIEF-JUSTICE WAITE, who has been talked of as a candidate for the Presidency, has made a really valuable contribution to political literature not only by declining to allow his name to be used for any such purpose, but by pointing out the gross impropriety of making the bench of the Supreme Court a stepping-stone to something else. The question was raised some years ago in Mr. Chase's case, and it caused then scandal and misgiving enough, one would think, to prevent its ever being raised again. The maintenance of public confidence in a tribunal charged with such powers as those of the Supreme Court, and in times when judicial independence has become a thing of doubtful good to many of the newer communities out West, is, under the most favorable circumstances, a task of no little difficulty. If it became the practice of politicians to search the Court every four years for available men, it would become impossible. Seats in the Court would be sought as a means of making the holders conspicuous among the Presidential aspirants, and from this the progress to looking on the judges as invariably candidates for the Presidency would be short and easy. The downward road in these matters, as we all know, is a smooth one, and the pace on it is apt to be tremendous. The decisions of the Court would then, in all the weightier questions, either come to be stump speeches, or would come to be so considered out-of-doors, and we should have discussions in the newspapers as to the effect of the judicial opinions on each man's "chances," and should be told that So-and-so's ruling in the Smith case had "killed him" or "laid him out," and "left the track clear" for his brother justice, who had taken the opposite side. After the process of degradation had gone on for a while, the persons who protested against it, and sought to arrest it, would be told that they were theorists and visionaries, that the kind of court they were trying for might perhaps be set up during the millennium, but that in these degenerate days we had to recognize the great fact that judges were men with the same passions as the rest of the community, and act accordingly; that England was very corrupt in the days of Robert Walpole, and that corruption existed in this country in the days of the Revolution; and that, after all, the best course to follow was to "leave the whole thing to the people." They know what they want, and if they want a President off the Supreme Bench, why, let them take him.

We have in this State an illustration of the danger there is in this indifference to tendencies, which was one of the most marked features of the Democratic movement of 1846. The leading theory of that movement, as of the French school from which it drew its political ideas, was that man was governed by pure reason, and that *all* progress was sure to be in the right direction, and that therefore the one duty of the statesman was to trust everything to the popular judgment of the hour, no matter how it was obtained or expressed. The people were therefore called on to select judges and attorney-generals with just as much confidence as to express their opinion on a tax, and it was said that the judges could not go wrong because "the people" would watch them, and that, if they did go wrong, the people, by some process which was never clearly explained, would bring them back to the paths of virtue with a sudden jerk at one or two elections. What followed was very instructive: the character of the courts rapidly deteriorated under the operation of principles of human nature with which every man and woman of the race have been familiar since the dawn of self-consciousness, but which the Democratic philosophers assured us ceased to have any force on the Fourth of July, 1776. It was then found, after the deterioration had become notorious, and when an effort was made to reform, that reform was no longer an easy matter; that political abuses injure not simply those who profit by them or perpetrate them, but those who permit them; that a bad judge debauches the very suitors who suffer from his badness; and that when you try to remove him you discover that mere familiarity with his doings has blunted or destroyed the popular horror of them, and made the very community he preys upon somewhat indifferent to his character.

In this State it was found, when, a few years ago, an attempt was made to return to the older and better judicial system, that the greatest obstacle consisted in the loss by the public of the old judicial ideal. People had forgotten what kind of thing an upright and independent judiciary was, and, therefore, when it was described to them as desirable they listened as they would listen to a discourse on the character of Abraham or the wisdom of Solomon, as something admirable, but distant, vague, and unattainable, and were easily persuaded that it was a literary man's dream. A good deal, however, was accomplished, thanks to the gross scandals of the New York City judiciary. The term of office was so lengthened as to make it practically a life-tenure, and thus greatly increase the attractions of the bench for lawyers at the age when the judicial qualities are at their highest; and the present Court of Appeals, when elected, was generally considered the best we had had for many long years, and perhaps so it is. But we have by no means got back to the old standard. The habits formed both by the public and by the judges since 1846 cling to them. The public continues to suspect the judges in spite of the new guarantees, and the judges, knowing they are suspected, are not careful about their reputation. They do not give up being politicians. They linger in the arena, and "confer," and plot, and plan, and intrigue, and aspire, and put themselves "in the hands of their friends," as before, although the temptations have been greatly diminished. The atmosphere, in short, from which a healthy and high-toned judiciary has to draw its life has ceased to exist, and has to be re-created before mere legislative reforms can bear full fruit.

We must not flatter ourselves, therefore, that if we let the Supreme Court go it will be easy to get it back again. Let one or two of its judges run for the Presidency, and no constitutional amendment making them ineligible would at once, if ever, restore the old tone and dignity and purity. Neither judges nor other men respect themselves if no one else respects them, and nobody could respect a bench which had supplied candidates to a convention. The Court has already suffered a good deal. It suffered seriously from the Dred Scott decision. It has suffered still more from the legal-tender decision; and it will be apt now to have cases constantly before it—such, for instance, as those arising out of the disputes between the Grangers and the railroads—which a suspected Court would find it difficult to dispose of satisfactorily. The strain, indeed, which the increase and conglomeration of wealth are likely to put on judicial integrity and judicial reputation, is certainly greater than that to which they were exposed through the pressure of royal influence. The influence of the new temptation is far more subtle, and far less alarming to judicial virtue, and far harder to discover. The growth of riches is creating powerful bodies of persons whose interest in legislation and judicial decisions is enormous, whose assiduity never tires, and who can often accomplish their object just as well by pretending they are able to corrupt officers as by acknowledging that they have corrupted them. The Rings never admit that any man is pure; they enlist support for their schemes by maintaining that there is no quarter in which they cannot "fix things." The stronger and more daring they grow, the more necessary it is that courts of justice should be fortified against them; and a court of justice is never fortified as long as it is not above suspicion. The Supreme Court is above suspicion thus far, and there is no such dearth of Presidential candidates as to make it excusable to expose it even to the shadow of a doubt.

## ENGLAND IN EGYPT.

THE purchase by Great Britain of the Khedive's interest in the Suez Canal for about $20,000,000 would probably have excited comparatively little interest or attention if it were not for the exceeding delicacy of the crisis which has arisen in the affairs of the Ottoman Empire. The outbreak of the insurrection in Herzegovina found both Russia and Prussia disinclined to interfere, and Austria

quite resolved that it should not spread or assume serious proportions; and Turkey, under these favorable conditions, was able to master and all but suppress it. But she was unable to suppress it without finding that she had become vulnerable in a way of which she had had no experience in any of her former troubles. In her various wars and rebellions prior to 1853, she had enjoyed the very great advantage for a semi-barbarous power of having neither debt nor credit. In other words, she paid as she went, and when she could neither pay nor plunder any longer she stopped fighting, and found herself very much where she was before she began. If the Government borrowed, it borrowed small sums at enormous rates of interest from Armenian or Jewish money-lenders at Constantinople, and, if it felt disposed to repay, raised the means of doing so by stripping a rich pasha or Christian of a portion of his fortune, or by applying the screws to the revenue farmers in one of the provinces. But it was in no way dependent on the good-will of the Western exchanges. Its good or evil fortune was not measured by the very delicate gauge of a rise or fall in stocks in London or Paris. It was, therefore, a great misfortune for it to be introduced, in 1854, into the circle of borrowing nations, because it added to its other burdens the burden of sustaining its credit; and if the conditions of national credit had been as thoroughly understood then as they are now, doubtless France and England would not have assumed the responsibility of doing so. The credit of a power which spends money otherwise than by the vote of specific appropriations by a legislative body, and which prepares and publishes no budget in preparation for the financial year, cannot possibly last, even if it possesses a good system of taxation and an efficient civil service, owing to the temptations offered in these days to spendthrift governments. It is very doubtful whether even Frederic the Great or the Bernese oligarchy would have remained thrifty and prudent and honest if they had had the facility in making loans which nearly all countries with even a semblance of civilization have enjoyed during the last forty years. It was therefore an act of folly for the Powers interested in the preservation of Turkey to launch her on a career of borrowing, because they greatly increased her vulnerability. She is undoubtedly stronger to-day in the kind of strength she has always had than she was at the fall of Sevastopol. She suppressed the insurrection in Herzegovina with rather more celerity and efficiency than she has ever shown under similar circumstances before, and if she had had no credit in the Western stock-exchanges, all would have been well. But her default in the payment of her coupons was at once taken as a sign of an approaching collapse against which her military strength and successes availed nothing; and as soon as it was announced, Russia changed her attitude and treated the crisis as a grave one, calling for decisive measures, and it is now said that the three great Eastern Powers are in accord in their proposed dealing, whatever it may be, with the Turkish problem.

The solution which seems to find most acceptance with the press is the occupation or protectorate of Bosnia and Herzegovina by Austria, of Bulgaria and Roumelia and Constantinople now or shortly by Russia, and the retirement of the Sultan to Brusa in Asia Minor, from which his ancestor started for his final assault on the Greek Empire; and everybody says that this of course means Egypt for England, and takes the cession to her of his interest in the Canal by the Khedive as an indication that he knows what is coming, and like a wise man is preparing for it. This programme, if carried out, would be substantially that proposed by the Emperor Nicholas to Sir Hamilton Seymour in 1852, which brought on the Crimean War, and its acceptance now by England, after the expenditure of a thousand million dollars and of a hundred thousand lives in opposing it, would be one of the strangest episodes in modern politics; but that England has all but made up her mind to accept it there seems little doubt. One of the reasons for doubting whether the three Great Powers have really come to any conclusion about the matter is, that while it is true that it has certainly ever since 1866 been the policy of Prussia to assign Austria a kind of missionary rôle among the Slaves in the Valley of the Danube, in order to prepare and compensate her for being one day pushed completely out of Germany and deprived of the German element in her population, this is a rôle which Austria is by no means ready to accept, both because the spirit of adventure is dead in her, and because the addition of a considerable body of Slaves to her population would aggravate what is already one of her greatest difficulties. She has already more discontented Bohemians and Croatians and Dalmatians on her hands than she can well manage, and it is more than doubtful whether, under the most favorable circumstances, she could ever incorporate them thoroughly into an empire which must inevitably for a long time to come be ruled by Germans and Magyars, and whether she could ever break them of the leaning towards Russia which the latter has sedulously cultivated during the last twenty years. Another reason is the improbability that Germany would be willing to have that immense population of European Turkey pass into the hands of a power with which the Germans must, in the natural course of things, have a good many questions to settle before their relations can be permanently adjusted. There is plenty of ground for supposing that Colonel Chesney's anticipation that the next great war in Europe will consist in a trial of strength between Germany and Russia is well founded, and, if it be, Germany can be in no hurry to put her rival in possession of the enormous advantages derivable from holding the Lower Danube and Constantinople, with a certainty of having Greece when she pleases.

But whatever way the question may be settled as between Austria, Germany, and Russia, England is fully aware that she will exert no influence on the settlement, and that she must prepare for the worst that can happen. The essential thing for her is to keep open her communications with India, and consequently the preservation of Egypt from foreign attack or occupation has been a prime object with her ever since the end of the last century. It was for this that Nelson's victory of the Nile was won, and that the expedition under Abercrombie was sent out and fought the battle of Alexandria three years later. There was a force of Sepoys sent up from India to take part in that campaign, though too late to contribute to the French evacuation, but their appearance was the first recognition of the fact that Egypt is and must really be considered, and now more than ever, an appendage of the Indian Empire. In fact, some of the most prominent Indian statesmen and soldiers of late years, among others Sir Charles Napier, have advocated its annexation as a thing sure to come, and the latter was in the habit of drawing glowing pictures of the army which might be made out of the Fellahs. They are, in fact, as military material, much superior to the Sepoys, and the contingent they furnish to the Turkish army has long been the most valuable portion of it. It is fair to believe that the purchase of the Canal, therefore, is the first step in a process which will reduce the Khedive to the position of one of the dependent Indian princes, and place his army at the disposal of the British War Office.

The satisfaction with which this bold move has been received in England is a strong indication of the extent to which the British public has been chafing under the timid foreign policy of the Liberals, but it makes it not unlikely that the Tories may take to it somewhat too freely as an avenue of escape from the consequences of their late blunders; and that it is a dangerous avenue there is no question, as it is one in which it is very easy to go too far. The probabilities are that it will be received with great satisfaction at St. Petersburg, as it will be taken as a sign that Great Britain is willing to accept the programme of 1853. The whole affair promises to be one more step in the process of pushing back the Oriental invasion which at one time came so near covering the whole of Europe, and augurs the speedy disappearance from the observation of the ordinary tourist of a civilization which, with all its moral and material imperfections, had certain charms in which ours is more and more wanting, and for which we more and more yearn the richer and more powerful we become. The East, ages ago, learnt only too well how to "rest and be thankful." The lesson has proved her political and social ruin, but we all acknowledge that a little of her power of repose is what Western progress needs to make it healthy and truly fruitful.

## NOVEMBER IN ENGLAND.

London, November 11, 1875.

MR. BROWNING has written a pleasing sonnet on the beauty of England in the month of April, expressing, in felicitous language, the delight which any one must feel who happens to be in England in that exhilarating month, when the early green things are budding. I am not aware that any poet has been inspired to celebrate the grim charms of the month of November in this country, and I am sure I do not wonder at it. The greater part of the Midland Counties through which I came the other day is under water, owing to the late floods, and a cheerless east wind broods over the whole land, like a malign divinity of Homeric times, drawing over to England the cold, inhospitable sea-damp from the Dutch coast across the German Ocean. But even with these discomforts surrounding us, there is some happiness in life for those whose destinies permit them to live out of London. Country-houses are generally well and hospitably filled at this season with pleasant people, and—for the men, at least—there is plenty to do. Covert-shooting is at its best. The leaves are off the trees, the undergrowth is no longer a jungle, the birds are strong on the wing, woodcocks—an animal highly prized by English sportsmen—have begun to show themselves here and there in the plantations, and the weather is mild enough to admit of a man standing for three-quarters of an hour in one spot without being incapacitated by cold from taking advantage of such opportunities as arise. Cub-hunting, which is poor sport to the regular hunting man, is over, and the true British sport of fox-hunting is in full swing; and if you want to find an Englishman in his most genial mood, you will do so when he has come home from a good run with a good pack of hounds, when he has been well mounted and led the field; and even if one or two of his best friends may have broken their collar-bones during the proceedings of the day, his spirits will not be seriously dampened. He has been on horseback all day, he has had his run and ridden his tired hunter home some fifteen or twenty miles, and he comes down to dinner as fresh and cheery as if he had done nothing to exhaust himself. He makes himself especially pleasant to the ladies, who have spent a dull day by themselves indoors, and he probably rides the run over again in the smoking-room for the entertainment of the less enterprising spirits who preferred the tame pastime of pheasant-slaying to the more invigorating pleasures of the chase. There is not much to complain of if your lot is cast in such pleasant places just now, and if your tastes are sufficiently cosmopolitan to enable you to enjoy such pleasures as the country offers—pleasures, be it remembered, which go a long way towards the formation of British character, and which, though they contain no small element of barbarism, have a good side also, and bring out the manliness and endurance which have ever distinguished those of Anglo-Saxon blood.

November is tolerable to and even enjoyable by those who spend it in the country, but to any one who is doomed to live in London it is the dreariest portion of the year. The yellow fogs for which this huge caravansery of human beings is notorious are generally at their best—or worst. We breakfast by candle-light at half-past nine o'clock, and grope our way from early morn to dewy eve in a thick, greasy darkness that might be felt. In December, we have frost and snow to cheer us and Christmas to look forward to. In January, the days begin to lengthen, and with their lengthening comes a sense of hopefulness, especially as Parliament will soon assemble and give us something to talk about. But November is the deadest, dullest month of the whole year. The statistics of London suicides stand high this month, as they ought to do. But as they are made up mainly of depressed Parisians who have not become acclimatized, we do not pay much attention to them.

Appropriate to the time of the year, the English law courts open at the beginning of the month; the municipal elections take place over England and Scotland, followed by an historical pageant called "The Lord Mayor's Show"; and people who have no opportunity of speaking elsewhere, or who want to keep their names before the public, go about the country lecturing to philosophical or literary associations, which generally commence their winter sittings in this dismal month.

A certain interest was attached to the opening of the law courts this year, because the old, confused system which had prevailed for centuries came to an end under the operation of the Judicature Act, and the Courts of Common Law and Equity were formally fused into one. But that interest was transient, and it affected the lawyers mainly—the general public only in a secondary degree. The effect of the changes will be that equity barristers will be less prominent than heretofore, and much of their business will become chamber practice. But the spirit of litigation is stated to be actively abroad in England, and there is plenty of work going about to delight the hearts of the lawyers. The new act is, on the whole, working smoothly, but it is said to be pregnant with questions of procedure which cannot fail to raise interesting points and to afford employment to many deserving young men. I cannot say how this may be; but a visit to Westminster and Lincoln's Inn and the Temple enables me to say with great distinctness that there is no lack of young men eager for employment. To them no doubt the future is bright with hope, and even the November fogs are tolerable.

The municipal elections have in the main resulted in favor of the Liberals. Last year, it was otherwise. But he would be a sanguine Liberal who saw in this fact even a symptom of the decay of the Conservative reaction which placed the present Ministry in power. Political feeling is undoubtedly one of the elements which determine the result of a municipal contest, but it is only one of them. The franchise is the same for municipal as for parliamentary elections in boroughs, except that women have votes (which they rarely use) in the former and not in the latter. But many local and provincial and personal considerations influence votes in the smaller arena which are necessarily excluded in the larger. The present Ministry have made more serious blunders in the eighteen months during which they have held office than the Gladstone Ministry made during their whole tenure. But the country is still with the present men, and they are permitted to secure seat after seat as they become vacant, because there is no fight left in the Liberals, and nothing to fight for if there was. The leaders of the Liberal party seem to have made up their mind to run a waiting race. This Parliament they give up as hopeless, but they husband their strength and their resources in order to show a good front at the general election, whenever that may be, and they are not unwise in this policy. The country is resting and comfortable. No one can say when or how it may awaken and bring itself together for action. The Turkish complications may arouse it more suddenly than any of us anticipate, or the outbreak of a religious war in the far East, of which the recent outbreak at Perak may be the premonitory symptoms, may cause us to open our eyes with a ruder shock than we expected. Whenever or however it comes about, the Liberal party, I doubt not, will give up its differences and throw aside its temporary supineness. In the meantime, let us be grateful for our repose, and enjoy what little excitements the spirit of November-time affords us.

In this mental attitude of gratitude I went to hear Mr. Forster (who was with you last year) open the Philosophical Institution in Edinburgh last Friday with an elaborate lecture on our Colonial Empire, and I assisted from a window at the Lord Mayor's show here last Wednesday. I cannot honestly say that I thought very much of either of the performances. Mr. Forster had apparently given a good deal of attention to the subject, and had carefully prepared his lecture. He gave us some interesting facts and a few not uninteresting surmises, among them these: that taking our colonies in the strictest sense—those only which are or can be peopled by white men—their area was not much less than four millions of square miles; and if the area of British India and of our tropical dependencies be added and that of the United Kingdom, the whole British territory is about eight millions of square miles, or more than one-eighth of the whole surface of the globe. The colonial population, he said, amounted to about six millions and a half, or an increase in twenty-one years of more than eighty-eight per cent., and that in eighty-four years from this time, allowing a similar ratio of increase, it would amount to eighty-two millions. These statistics and the calculations deduced from them were listened to with attention, as such dry bones always are listened to by a hard-headed Scotch audience. The abundant flattery which Mr. Forster poured out upon his hearers was also accepted pleasantly. But, to my mind at least, there was the want of the true ring of conviction in much that Mr. Forster said. It seemed as if he had got up what he considered the popular side at the present moment—as if, in short, the motive of the address was not so much the future of our colonial empire as the future of Mr. Forster.

My other little excitement, the Lord Mayor's show, was indeed a pitiful one—a procession consisting of twenty shabby carriages, six men in armor mounted on steeds which had not a caracole among them all, six men dressed like Robin Hood in a provincial theatre, the Lord Mayor's coach as it appears in Hogarth's picture of the "Good Apprentice," and several bands of music. That was the whole ceremonial. I may dismiss the matter with a sentence borrowed from Mr. Samuel Pepys when he went to see the same performance two hundred and fifteen years ago, on the 29th of October, 1660: "I up early, it being my Lord Mayor's day, . . . to one Mr. Isaacson's, a linendraper at the Key in Cheapside; where there was a company of fine ladies, and we were civilly treated, and had a very good

place to see the pageants, which were many, and I believe good for such kind of things, but in themselves but poor and absurd" (Mr. Pepys's 'Diary,' Vol. I., page 150).

# Correspondence.

## THE CHEVALIER HABICHT.

To the Editor of The Nation:

Sir: Some time since your paper gave currency in an editorial to a charge made in the *Herald* reflecting upon the official character of "the Chevalier Habicht" while Consul of His Majesty the King of Sweden and Norway.

The *Herald* publishes a card from Mr. Habicht which appears to conclusively establish his innocence of the charge anonymously made in the *Herald* and credited editorially by yourself.

Is it not due to fair dealing that you should give Mr. Habicht the benefit of his denial? A charge of this sort, receiving the editorial sanction of yourself, preserved in a paper credited with care and accuracy in all departments, and which from its excellence as well as from its form is frequently preserved for binding and future reference, is more serious than the same in a great morning daily, which is almost never preserved.

I am, dear Sir, very respectfully yours,

Rowland R. Hazard.

[It is. Our not having sooner done what we could to set Mr. Habicht right on this matter has been due to oversight simply. We had ourselves made enquiries prior to the appearance of his card in the *Herald* which satisfied us that Mr. Seward had acted with undue precipitation and with great injustice. He condemned the accused without a hearing, and apparently without any investigation whatever; but then it was in the middle of the "little bell" period, when the country was eager for vigor above all things.—Ed. Nation.]

## THE NEO-PAGANS.

To the Editor of The Nation:

Sir: What is a poor reader to do when the most authoritative dictators of literary opinion flatly contradict each other? I am composing, for the use of high schools and academies, a manual of the literature of the nineteenth century. After reading the able article on Charles Baudelaire, by G. Saintsbury, in the November *Fortnightly*, I penned a short notice of him for my work, based on what Mr. Saintsbury had said, for I have no first-hand acquaintance with his writings. No sooner had I done so than a friend pointed out to me an article in the last volume of 'Études,' by Edmond Schérer, which made me tremble at my rash confidingness. Which is right and which wrong? Here is the key-note of Saintsbury:

"Valuable and delightful as he is for private study, with no further end, he should be yet more valuable and productive of multiplied delight as a model and a stimulant. It is reported of a scholar not unknown at one of our universities that before going to bed he invariably, in conscious or unconscious parody of ancient habits, reads a sonnet of Shakspere. If this practice should spread, and manuals of devotion become common among men of letters, I know none that I should be tempted to adopt myself and to recommend to others in preference to the writings of Charles Baudelaire."

And here a specimen of Schérer:

"There is no reason why this process [of seeking strong *sensation* in literature] should ever stop. The terrible being exhausted, we come to the horrible and the disgusting. We paint unclean things. We grow furious and wallow in them. But this rottenness itself rots; this decomposition engenders a decomposition more fetid still, until there remains an indescribable something that has no name in any language. *Voilà Baudelaire.*"

Yours truly, W. J.

Worcester, Mass., Oct. 29, 1875.

[We fear that this letter, under the specious garb of ingenuousness, may really be an insidious attack upon the authority of literary critics generally. We shall not ourselves state whether we consider M. Baudelaire an Hyperion or a Satyr—our words might only make confusion worse confounded—but we will simply remind our correspondent that the utterances of a critic, like those of any one else, should be read in the light of the previous tenor of his life and of the company he keeps. Now, if our memory of previous articles in the *Academy* signed by G. Saintsbury serves us aright, there mantles already upon his genius the hue of a premature decrepitude. We think it was he who in a recent notice of Walt Whitman picked out for special glorification all the most spurious-sounding passages in that poet's works—those about the grass being "the beautiful uncut hair of graves," "the produced babe of the vegetation," and the like.

The entire neo-pagan school of writers in England, from Mr. Swinburne all the way down to the present critic, must fill conservative Britons with amazement at its performances. It is impossible to imagine anything less like the voice of the stout, vascular, humorous Anglo-Saxon temperament than their stringy, shrill, emasculate falsetto. To be for ever conscious of the tremendousness of one's own "culture" and of the gulf that lies between one's own illuminated intelligence and the ordinary Philistine brain, is no doubt a very flattering unction to the soul, but a bad thing for the judgment, especially in minds as impervious to humor as these writers all are. The tone in which they urge us to cultivate in turn the frivolous, the cruel, and the libidinous capacities of our imagination is usually as dry and solemn as that of a Scotch funeral sermon. It really takes the Latin races to do this sort of thing with a light and unpedantic touch. For these Englishmen to have made the tardy discovery that the moral didactic element is not the all-in-all of literary art is no doubt well and good; but it does not follow that they need therefore seize upon every witless literary manifestation—provided only it be immoral also—and command us to revere it. They forget that, pursued in this singularly heavy and studious fashion, vice loses more than half its charm. Its principal merit always lay in its spontaneity and freedom from the Pharisaic exclusiveness that virtue often engenders. But when vice grows exclusive and priggish and sicklied o'er with pale, æsthetical self-consciousness, all the odds pass to the side of virtue. *It* becomes the symbol of lightness and emancipation, and vice the dreary and burdensome thing every passing minute which it is commonly admitted to be in the long run.

The truth is that the only tolerable way to be unmoral is to be so by the grace of nature and unconsciously. Once begin to theorize and write magazine articles about what is the most vulgar and what the most *distingué* form of moral sensibility to possess, and any genuine pagan will repudiate you for a dilettante and a sham. You have been caught *in flagrante delicto* of having a conscience, and a most superfine one at that; you can nevermore get rid of it, and the only question for you is, Shall it keep natural and wholesome, or spoil upon your hands? If the little sect of English writers we are considering affect to prefer the latter alternative, and to enjoy a rancid and gamey flavor in their ethics, M. Schérer has never been guilty of any such pretentious inanity. He is one of the foremost of living critics, and we think that our correspondent (if still bent upon composing his 'History' at second-hand) will find him a far safer guide to follow than any of his English "pagan" rivals.—Ed. Nation.]

# Notes.

The *New-England Historical and Genealogical Register* for October is entirely occupied with Centennial addresses and proceedings, from the centenary of the meeting of the first Continental Congress, Sept. 5, 1874, to that of Washington's taking command at Cambridge, July 3, 1875. The number has also been published as a separate volume, in an edition limited to 250 copies. The illustration is a portrait of Gen. Warren.——Henry Holt & Co. send us a complete set, in twelve volumes, of their library edition of Taine's works, whose titles are as follows: 'English Literature' (3 vols.), 'Lectures on Art' (2 vols.), 'On Intelligence' (2 vols.), 'Italy—Rome and Naples; Florence and Venice' (2 vols.), 'Notes on England' 'Notes on Paris,' and 'A Tour in the Pyrenees.' As our readers are aware, the paper, print, and binding of this series leave nothing to be desired in

point of taste and attractiveness, and holiday gift-buyers may well bear it in mind.——The usual pamphlet 'Proceedings of the American Philological Association' for the seventh annual session, held at Newport last July, has just been published at Hartford.——Quite recently we had occasion to notice the supplement to the catalogue of the Wisconsin Historical Society's library, and now we receive from the Pacific Coast a supplement to that of the Mercantile Library of San Francisco. The main work is, as our readers are aware, one of the very best of the recent improved catalogues on the dictionary plan. The supplement fills 168 pages, and represents an accession of about 5,000 volumes to the 36,000 reported up to February 1, 1874—certainly a very healthy growth. It merits the same praise as its predecessor for attractive typography, judicious subdivisions, and full analyses of contents. The only new feature is a numbering with reference to position on the shelves.——According to the *Athenæum*, a codex of the Hebrew Scriptures revised by Rabbi Aaron Ben Asher has lately been discovered at Aleppo, and Dr. Ginsburg is about to set out for Syria in order to collate it.——In Italy, the Government assists by subsidies in the establishment of popular (as distinguished from public) libraries. By a recent order of the Minister of Public Instruction, hereafter no moneys will be given for the acquisition of books, but at discretion the books themselves will be furnished according to the locality and the prosperity of each institution. The Minister has invited the state teachers, authors, and publishers to point out and submit to him the works they deem best calculated to improve artisan and peasant readers.

—In *Harper's* for December there is a very fresh and entertaining paper on the colonial antiquities of suburban Charleston, called "Up the Ashley and Cooper," by Constance Fenimore Woolson. The writer has been diligent in collecting facts about the old houses and churches of the "first families" on the back plantations along and between the two rivers, and has found much that is curious to tell about the Draytons, Izzards, Middletons, Warings, Blakes, Gibbeses, Smiths (of the same stock that furnished a wife for John Adams), Moultries, and the other settlers of Dorchester and Goose Creek. She has also, apropos of the Ashley, something to say about the post-bellum phosphate industry which has done so much to help South Carolina over the thin ice of commercial reconstruction. The illustrations which accompany the article are excellent. Mr. Parton's series on caricature concludes, we suppose, with "Caricature in the United States." He has apparently had some difficulty in filling out this chapter, especially for the earlier periods. But for his anti-Federalist zeal, one would have expected to meet here the immortal figure of the Gerrymander, which is, however, conspicuous by its absence. Dr. Barnard's centennial paper, on the progress of the exact sciences, may be read with unalloyed satisfaction by every American. Why Mr. John Swinton's "narrative piece" should have been marked off into stanzas, and otherwise given the look of verse, we cannot for the life of us imagine. We doubt if even a reference to Walt Whitman could explain it.

—The December *Scribner's* contains a second instalment of 'Gabriel Conroy,' a novel which promises to be interesting, and to arouse anew a good deal of discussion as to its author, Mr. Bret Harte. Whether Mr. Harte has only talent or is possessed of genius, whether he is an American imitator of Dickens or an original product of American soil, whether his latest work is his best or his worst—all these questions will probably be thoroughly discussed by the pestilent tribe of critics as soon as the story makes its appearance in a complete form, and we have no desire to anticipate the public verdict, except within the safe limits of a prophecy that 'Gabriel Conroy' will be much read and much talked about. Enough of it has, however, already appeared to warrant us in noticing the fact that the author has apparently determined to work the vein in which he made his first marked success—that of extreme Western low life. Like Dickens, Mr. Harte has always shown that low life is what he understands how to describe, and that of the life of the "gilded halls of fashion" he has a very dim and inadequate idea. Ladies and gentlemen in Dickens's works are creatures of the brain, not flesh and blood, and generally are typical lay-figures illustrating some moral quality, as charity, cheerfulness, youthful manliness, meekness, gentleness, and so on; on the other hand, his stable-boys are real stable-boys, his hostlers are sure to reek of the noble animals they care for, and his cockneys could be identified as cockneys were we to meet them in far Cathay; in short, with all his characters taken from the sphere of low life, though there may be exaggeration and caricature, it is generally caricature and exaggeration within limits permitted by the reality. Mr. Harte has always shown the same peculiarity, and this is noticeable owing to the fact that it is not by any means the only link which connects him with the author of 'David Copperfield' and 'Oliver Twist.' Those who have read Mr. Harte's 'Condensed Novels' (we believe that was the title) probably remember a masterly imitation of Dickens's style in the story founded on the 'Christmas Carol'—an imitation so good that it could hardly be called a parody, and which seemed from its close resemblance to suggest a sympathy of no ordinary kind between the two authors. The same sympathy may be seen now and then in everything he writes; as, for example, in such details as the headings of some of the chapters of 'Gabriel Conroy'—*e.g.*, "Chapter VIII., The footprints grow fainter," followed of course by "Chapter IX., In which the footprints are lost for ever"—headings that we should have been quite ready to maintain came out of 'Barnaby Rudge' or 'Bleak House.' In Mr. Harte's present story he has apparently determined to show us low life at its lowest, and in the opening chapters we make the acquaintance of a party of emigrants or prospecters reduced—many of them by taste, others by circumstances, and almost all by the snow which has cooped them up and by starvation—to the level which just separates man from beast, in fact, to the level at which the stronger and hungrier man begins to eat his less powerful comrade. To say that the description can be read without a shudder would not be true, but it is skilfully done, and to shudder over the half-revealed atrocities hinted at by Mr. Harte is not to prevent us from looking forward to the next number with interest.

—A timely and forcible paper on "Medical Education in the United States" will be found in this month's *Lippincott's*. It is by Dr. H. C. Wood, jr. With no waste of words, it contrasts the European requirements for the medical practitioner with the total lack of them in this country. We say total lack because Dr. Wood declares with emphasis that the Harvard diploma "is the *only one* issued by any prominent American medical college which is a *guarantee* that its possessor has been well educated in the science and practice of medicine." He denounces the mode in which medical colleges are multiplied beyond all need; says that there are now over a hundred of them, "whilst the natural demand would call for not more than a dozen"; that they turn out 3,000 graduates a year, or nearly five times as many physicians as are licensed in Germany for a larger population; that such is the competition among them that "long ago the standard of graduation was very low—now it is approaching zero," and even in the Philadelphia schools (with which the writer is most conversant) it is no higher than it was ten years ago, "and I believe even lower." The physicians who found the multitude of new schools, and, composing themselves into faculties, become self-styled professors, "may be in truth looked upon as joint-stock companies, or copartnerships possessed of a valuable franchise." For one thing, they escape "a custom which binds the profession with the iron rigidity of a social law," viz., "that no medical man may announce himself in the daily press even by a simple card. Even one who essays to practise a special branch is ostracised in many localities if he merely puts 'aurist' or 'oculist' on his window-shutter or door-plate. But if the physician be connected with a public institution, that institution must advertise him in the course of its own necessary advertisement. Hence, in the great majority of cases, the professor's chair becomes very valuable as a road to practice." As a protection against quacks and half trained doctors, Dr. Wood proposes a State board of examiners, getting over the obstacle of "sects" in this way: "The differences involve only the treatment of disease. Let, then, the board examine only in the other branches. The man who has passed a severe examination in the fundamental sciences of medicine—chemistry, anatomy, physiology, and pathology—as well as in the natural history and diagnosis of diseases and injuries and the principles of mechanical treatment, may with some degree of safety be trusted for the rest." Or supplemental boards for therapeutics might be instituted, as in Canada. Another attractive paper in *Lippincott's* is Mrs. Kemble's "Notes on the Characters of Queen Katharine and Cardinal Wolsey in 'Henry VIII.'" The writer is led in her analysis into some expression of opinion as to the disputed Shaksperian portions of the play, and closes with this bit of criticism:

"I have read lately of comparisons between 'Henry VIII.' and Tennyson's 'Queen Mary': to me this latter production appears no more like Shakspere's writing than a suit of his clothes would be like him; they would certainly remind any one who saw them of him who had worn them. I am much mistaken if Alfred Tennyson himself would not be more apt than any one to say (if it may unprofanely be said), 'Why callest thou me Shakspere'?"

We notice, by the way, that a prize is offered to the Sophomore Class of Trinity College, Hartford, for a Greek translation of the 'Queen Mary,' Act V., Scene 4.

—The deaths of Mr. William B. Astor and Mr. Henry Wilson, happening

as they did almost at the same time, brought out into very strong contrast two widely opposed types of American life—the successful politician, working his way up to the highest positions in the public service by making politics the business of his life, and the successful accumulator of property, to whom all political questions were mere wind and fury, signifying nothing. If Mr. Wilson had been asked at any time during the last forty years to explain the whole duty of the American citizen, he would have said that it consisted in taking an active part in public life, in attending the primary meeting, in seeing that none but fit men were nominated for office; and probably if he had been asked to point out the causes of the misgovernment and anarchy in this city, he would have declared it to be the indifference of the wealthy and intelligent classes to their political duties. Speaking broadly, the whole vast accumulation of property by two generations of Astors has been accomplished in defiance of this theory of the duty of the citizen, and you would hardly at any time during Mr. W. B. Astor's long life have persuaded him that there was anything in it. The Astor property was accumulated by men whose first maxim, in practice at any rate, was that the merchant or capitalist who had anything to do with politics, except so far as to make himself secure against oppression or over-taxation, stultified himself, and directly diminished, by the amount of his political activity, his chances of success in business. The property of which the late Mr. Astor was possessed would have enabled him, had he felt inclined to make the attempt, to exercise a very large share of the political power of the city in which he lived, but his political life and ambition were confined to a quiet resolution that, whatever party or ring might be in power, it should not harm his capital or income. Within these limits, submission to the ruling powers, no matter of what stripe, was his simple plan, and was adhered to as steadily as if he had been living under a despotism instead of in a free country. The only connection between the public and Mr. Astor was the Astor Library, which cannot be said to have been kept up as it should have been, though it has received constant attention. It might easily have been made one of the finest libraries in the world. As Mr. Astor's will has not yet been published, we do not know what provision has been made for its support and continuance.

—The secresy which has hitherto surrounded the plan of the new musical college has at last been removed, and it appears that a New York millionaire is really going to give the city a fund for musical purposes hitherto undreamt of in the history of the art. It is probably not only an unheard-of gift in amount, but it is a rare instance of liberality and public spirit, too, that a whole family should solemnly agree to accumulate almost their entire substance as a fund to be given to public use by the survivor. Whether Mr. Wood's munificent endowment will really enable New York to compete with Europe in music remains to be seen; but there can be no doubt of one thing—that gifts like this do a great deal to disprove the commonplace maxim about æsthetics, to the effect that they never thrive without government patronage. It makes, of course, no difference whether the patronage be governmental or private so long as it is large enough, and the axiom rests on the supposition that private patronage will never contribute enough. The art of which it is supposed to be most clearly true is that of the stage, but it ought to be quite as true of music, and a musical endowment of from three to five millions for a city like New York seems to show that it is true of neither.

—The announcement that Tupper has composed a centennial poem called "Washington," and will try to procure its representation here next year, has brought down a great deal of criticism, or, more properly speaking, vituperation, on the head of the author of the 'Proverbial Philosophy,' which will, we fear, make but little impression upon him. He has been exposed and riddled by the wit of the English weekly press more thoroughly than any modern writer; his pretensions as a poet have been completely upset over and over again; his philosophy has been shown to be no better than his poetry, and his poetry no improvement on his philosophy. Yet the callous bard goes on after his kind producing verses unblushingly, and his readers go on in their ignorance reading them; and, having fought the good fight of mediocrity and triumphed in England, it is no wonder that he should be tempted to conquer a new world on this side of the water. Under these circumstances, he did what was a very wise thing to do—he captured the gallant Colonel Forney, General Schenck, and a few other distinguished Americans in London, and read his poem, or drama, or whatever he calls it, to them. The fox in the fable had no better reason for persuading the others of his tribe to cut off their tails than these gentlemen now have for procuring Mr. Tupper other victims, and we must protest against this transparent act of revenge.

—Dr. Wilson of Toronto, in a paper on "Hybridity and Absorption in relation to the Red-Indian Race," reprinted from the *Canadian Journal*, "adduces data," according to *Nature*, "to prove that a very considerable proportion of red blood has been absorbed into the whites of North America, and that especially in the Canadian Dominion this shows itself in the physiognomy of all classes"; also that "there is ground for believing that this influence is decidedly good, physically and intellectually." Furthermore: "The characteristic Brother-Jonathan face, which is generally attributed to influences of climate, soil, food, etc., Dr. Wilson is inclined to attribute to a decided admixture of Indian blood." That the colonial French and the Indians "hybridize" rather freely is well known, and Dr. Wilson's "data" are all probably from Canadian sources. But imagine the grim smile which will pervade the somewhat austere features of the typical Yankee when he reads that they are derived from an Indian admixture, along with an advantage to his physique and intellect which may compensate for some loss of beauty!

—At the recent (the sixteenth) annual meeting of the German Historical Commission in Munich, held early in October, it was announced that the 'History of the Sciences in Germany' is approaching completion. The fourteenth volume, Prof. Roscher's 'History of Political Economy,' was issued during the past year, and Prof. Sachs's 'History of Botany' is ready for the press. The histories of mathematics (by Prof. Gerhardt of Eisleben) and of historical science (by Prof. Wegele of Würzburg) will next appear, to be followed by the volumes on geology, classical philology, and medicine. The editorship of the volume on physics is at present undecided upon, and that on the science of war has recently been delegated to General von Troschke of Berlin. We may appropriately notice that though Prof. von Sybel, whose occasional addresses during his connection with the University at Bonn have found mention in our columns, has recently removed to Berlin to accept the directorship of the Prussian Archives, his membership in the Academy of Sciences in Berlin permits, we believe, a certain activity in connection with the Berlin University, so that historical students may hope to retain him as a personal teacher. In the conduct of the Archives he will find abundant opportunity for introducing some useful reforms.

—Those of our readers who have followed the discussion upon the new German School of Economists will be interested to know that Roscher has this year published the eighth edition of the second volume of his 'National Economy.' The complete plan of the work comprises four volumes—the first upon the general science, the second its application to agriculture, the third to manufactures and commerce, the fourth to governmental relations. Only two volumes have, however, been published. The scope of the present volume—'Nationalökonomie des Ackerbaus'—can be judged from the titles of the chapters. The first book, "Vorstufen des Ackerbaus," has chapters upon fishing, hunting, and pastoral peoples; the second book, agriculture, embraces the successive heads—general character, extensive and intensive agriculture, its several branches, large and small estates, relation of proprietor to cultivator (*Landwirth*), property in land (*Grundeigenthum*) and the communities, property in land and families, property in land and classes, burdens of the peasantry, agricultural (*landwirthschaftlicher*) credit, misuse of alienation of land (*Mobilisirung*), trade in corn, agricultural insurance, and agricultural education. The third book treats of the industries subsidiary to agriculture (*Nebenzweige*), fisheries, grazing, and forest culture. These titles give a tolerably good notion of the appropriateness of the term "Historical School of Economists."

—The police service of Vienna, as at present constituted, is of very recent growth. The ignorant and often brutal policeman of the old Kaiserstadt, recruited in great part from the Czech soldiery, survived the era of Metternich and Sedlnitzky, his all-powerful president of the police, until 1869, when he made way for his intelligent and mild-mannered successor. The native humor of the Viennese has not been slow in characterizing the change, and the Sicherheitswachmann of to-day, with his overflowing politeness, is as much a stereotyped figure in the comic newspapers as the Czech guardian of the peace, with his broken German and uncouth ways, was years ago. The new police corps is a purely civil organization, which partakes of the spirit of enlightenment now prevailing in Austria. It possesses schools of its own, both for special and general instruction. The men, on joining the force, enter a preparatory class, and, when fitted for active duty, complete their knowledge of the regulations of the service in the schools of their respective districts. In the schools for the training of inspectors, as the superior officers are called, lectures are delivered on the fundamental laws of the empire, the criminal and civil code, on geography, history, etc., while special instruction may be had in swimming and navigation, telegraphy, French and English. The linguistic

attainments of the Vienna police are probably superior to those of any similar body of men, owing, of course, mostly to the peculiar complexion of the empire. At the close of 1873—we quote from the last report of the Mayor of Vienna—the force numbered 2,708 men, of whom, in addition to German, 1,512 spoke the Slavic dialects, 284 Italian, 268 Hungarian, 65 French, 59 Roumanian, 40 Hebrew (!), 14 English, and 6 Spanish. Seven hundred and twenty men may be said to have received a liberal education, 441 having passed through *Gymnasien* and *Realschulen*, and 74 having attended commercial schools. In fact, the list showed a sprinkling of almost every kind of professional education, even theology, pedagogy, surgery, and the fine arts claiming 5, 10, 11, and 5 representatives respectively. Whether there is cause for unmixed congratulation in the fact that so much valuable material should have been turned into this particular channel of usefulness, is perhaps an open question. Possibly the figures, so creditable to the intelligence of the Vienna police, may also throw some light on the unmistakable inferiority of their physique as compared with that of our metropolitan protectors. The latter will find food for reflection in the statement that, while 23 policemen were wounded in making arrests, they, in turn, made use of their weapons only in 16 cases, inflicting slight injuries.

## BOYNTON'S REVIEW OF SHERMAN.*

II.

THE next charge is of injustice to Rosecrans in the account of the battles of Iuka and Corinth, and Gen. Boynton relies chiefly upon the reports of Grant to prove that he was not dissatisfied with Rosecrans in those engagements, as Sherman asserts. We cannot think this a conclusive way of answering an assertion made by Sherman on personal knowledge. All the dissatisfactions felt by commanding generals are by no means displayed in official reports. Grant rarely, if ever, indulges in censure in such documents. They are always intended, to a certain extent, for public effect, and only extreme necessity or provocation will induce a wise commander to make a report a discouraging or a complaining one. The chief business of history is to get behind these reports, and an appeal to their generalities against details given on personal knowledge is an inversion of the proper order and mode of investigation. It has always been notorious in the army, and Gen. Boynton admits the fact (p. 53), that from the time of this campaign Gen. Grant had a great dislike of Gen. Rosecrans, so great that to it is currently attributed the abandonment of his profession by Rosecrans when Grant was elected President. The reasons for this dislike which Gen. Boynton suggests are not in themselves sufficient, and the care with which Grant in his official report (p. 46) limits the credit of the fighting at Iuka to Gen. Hamilton, while he gives no word of commendation to Rosecrans personally, is significant to those whom a knowledge of attendant circumstances enables to read between the lines. Sherman is the best authority for what Grant felt on that occasion, and, so far from censuring Rosecrans himself, he defends him, urging that the inherent difficulties of such combinations as were there attempted were enough to account for a lack of complete success (p. 45). In regard to the battle of Corinth, Sherman criticises nothing but the pursuit of the enemy, which he evidently thinks was not prompt enough, and adds that Grant was again displeased. Sherman does not express his opinion in any offensive manner, and as to his assertion of Grant's displeasure we can only repeat that the absence from the reports of an open expression of it does not disprove the fact.

We have neither time nor space for an extended examination of the next charge, which is that of blundering and reckless waste of life in Sherman's assault at Chickasaw Bayou, near Vicksburg, in the latter part of December, 1862. He was ordered to reduce Vicksburg if he could with such forces as were placed at his disposal. He reconnoitred, chose the place of attack which seemed most practicable, assaulted, was repulsed, admitted it, and assumed frankly the responsibility. Had he not assaulted, plenty of critics would have sworn that a vigorous attack would certainly have been successful. Let that pass; we are dealing chiefly at present with his veracity and fairness, or the contrary. In connection with the assault above referred to, Sherman is charged with unfairness towards Gen. Geo. W. Morgan, commandant of a division ordered to make the attack at the point chosen as the key to the situation. Sherman says Morgan was to lead his division in person, and that he had promised "in ten minutes after you give the signal I'll be on those hills." He further asserts that Morgan did not go forward with his command in person, nor cross the bayou in front of the hills, and to this he attributes the failure of the attack (p. 57). No soldier will deny that if the facts are so the failure is sufficiently accounted for, and that much stronger language than Sherman uses would be justifiable. The disproof of Sherman's assertions offered by Gen. Boynton is purely circumstantial, as follows: Sherman does not make the charge against Morgan in his official report, though he does say that Morgan promised to renew the assault in half an hour and did not do so. To this a plain answer is that the fact of Morgan's personal conduct may not have been learned by Sherman at the time of writing the report. The "record" does not "contradict" Sherman, and we hold it scarcely credible that Sherman would declare that Morgan did not cross the bayou in person and lead his division to the attack unless there was pretty good evidence of it. Morgan is still alive, and so are hundreds of men and officers who were in his command that day. A charge of unfairness cannot be made out so. A plain question of fact should either be met in some other way, or, for the sake of those whose names are involved, it should not be mooted.

In Chapter VI., Gen. Boynton charges that Sherman is again unjust to Rosecrans in stating that he was defeated by Bragg at Chickamauga and driven into Chattanooga. For present purposes, it is enough to say that Sherman holds that opinion in common with nearly everybody else, and is therefore not chargeable with malice in entertaining it. Gen. Boynton's theory, that the retiring to Chattanooga was "strategy," and that it was parallel to "Hood's driving Sherman into Atlanta," is, to say the least of it, novel, and we are forced to declare that a single reading of the "record" does not seem to sustain the theory.

As to the condition of things when Sherman joined Grant in person before the battle of Missionary Ridge, Sherman in his 'Memoirs' has given a detailed report of a conversation with Grant, quoted in the Review (pp. 70, 71). Upon this, Gen. Boynton charges Sherman with unfairness to Thomas and the Army of the Cumberland, disregarding the fact that Sherman is telling Grant's opinion, and not his own. The conversation is an important and interesting historical item; and to intimate that it is purely imaginary because, some ten days later, Grant ordered Thomas to make a preliminary movement, before Sherman's troops had come into position, does not seem to us worthy to be called criticism. Grant's opinion of the demoralization of Thomas's command may have been a mistaken one, or the near approach of large reinforcements may, and naturally would, have improved their *morale*; but to ignore all other explanations except that Sherman should have invented or imagined the conversation he narrates, is certainly a most curious method of contradicting Sherman by the "record."

The next charge, viz., of injustice to Gen. W. Sooy Smith, will be found again to turn mainly on a question of fact, viz., whether Smith failed in the cavalry movement he was ordered to make in support of Sherman's Meridian campaign, partly by reason of unnecessary delay in moving, but chiefly by allowing Forrest to beat him with an inferior force. The reviewer denies both that Forrest's force was inferior and that Smith was beaten; but as these are his own assertions, wholly unsupported by any quotation "from the files," he must be held to have failed again in the promise to contradict Sherman only by the "record." To the pretence that his assertions are proved by the fact that Sherman's congratulatory order to his troops, then at Meridian (of which Smith's command was not a part), tells them they have "fulfilled, and well, all the objects of the expedition," there is absolutely no response so appropriate as the common slang, "too thin."

Chapter VIII is devoted to the ungenerosity of Sherman to McPherson in a passage of his 'Memoirs' in which he says of McPherson's failure either to occupy Resaca or to break up the railroad in Johnston's rear: "Such an opportunity does not occur twice in a single life, but at the critical moment McPherson seems to have been a little timid. Still, he was perfectly justified by his orders," etc. If Sherman is to be permitted to hint the slightest doubt of the absolute completeness of McPherson's movement, he certainly cannot find language to do it more gently. If his well-known friendship for McPherson lays him under obligation to attribute infallibility to that good soldier, we have nothing to say except that the rule would make all honest memoirs impossible. Look a moment at the facts. Sherman, expecting to attack Johnston in front and on the east of Rocky Face Ridge, ordered McPherson, with twenty-three thousand men, to march by Snake Creek Gap "to Resaca, to destroy the railroad" behind Johnston. "*After breaking the road good*, his orders are to retire to the mouth of Snake Creek Gap, and be ready to work on Johnston's flank in case he retreats South" (p. 103). McPherson found Resaca fortified by field-works, and occupied by a brigade of the enemy; he made no serious attack on the place, nor did he break the railroad either "good" or at all.

* 'Sherman's Historical Raid. The 'Memoirs' in the Light of the Record. A Review Based upon Compilations from the Files of the War Office. By H. V. Boynton, Washington Correspondent of the Cincinnati *Gazette*.' Cincinnati: Wilstach, Baldwin & Co.

This is the "record" which Gen. Boynton says "shows conclusively that Sherman *ordered* McPherson back to Snake Creek Gap, and that the charge of timidity is gratuitous." And this is military criticism!

In passing, we will say that Gen. Boynton produces copies of a number of interesting despatches, showing that Sherman fully expected at first to fight Johnston by a front attack near Dalton, and that the movement of the whole army by Snake Creek Gap was not determined on till two days of pretty sharp partial assaults had proved that the position was every way too strong to be carried in that manner. The assertion of Sherman's 'Memoirs,' therefore, that he "had no intention to attack the position seriously in front," must be understood to have reference to his purposes after the character of the natural and artificial defences had become apparent, namely, on the 10th of May, when his despatch to Halleck shows that he no longer expected to press a main attack upon the front. The statement of the 'Memoirs' needs this qualification. This in no way affects the question as to McPherson's action; for on either hypothesis the breaking of the railroad "good" was a most important thing to do, and if McPherson had had the audacity to carry Resaca, or put himself astride of the railroad, throw up breastworks, and take such hard knocks as might come, it is now certain that Johnston's army would have suffered all, and more than all, that is indicated by Sherman. If, then, the war maxim, "*l'audace, toujours l'audace*," has any force, McPherson *must* be held to have lost one of those opportunities which do not ordinarily occur "twice in a single life."

The chapter on the assault upon Kenesaw, which is called "an inexcusable slaughter," might be dismissed with the single remark that in war very few apologies are necessary for a bold attack upon a wooded position whose strength cannot be known till you try it. Otherwise, Grant would be culpable for such attacks as that upon Missionary Ridge and Lookout Mountain, where the element of boldness in his movement now rightly gives him the chief glory of it. State the case thus: Sherman, with about a hundred thousand men, found himself in front of a weaker enemy, holding a line of high wooded hills. His line of communications is a single railroad in his rear several hundred miles long, which is kept fully busy in supplying him from day to day in a country which affords nothing for the subsistence of his army. To turn the position involves the abandonment of his communications, and the taking of all the chances that his supplies would utterly fail, while the miry roads of the country were almost impassable. Shall he take the latter course without trying an attack on the position? We are sure every impartial military critic will say he must try the attack. Take another step. If he makes the attack with about eighty thousand men, and has a list of casualties of about two thousand five hundred killed and wounded as the result, is that by military rules to be regarded as "an inexcusable slaughter"? The answer must certainly be, No. Once more, considering again the attacking force and their losses, was there or was there not good ground for Sherman's saying that "one-fourth more vigor, mathematically," would have "put the head of George Thomas's whole army right through Johnston's deployed line," when Thomas reported his columns as able to hold their ground "within sixty yards of the enemy's entrenchments"? It surely cannot be regarded as extravagant. Still again, when after such a proportion of casualties to the numbers attacking, Gen. Thomas says (p. 114), "One or two more such assaults would use up this army," and can only suggest an approach of the enemy's field-works "by regular saps," does he exhibit such ideal energy that Sherman must be thought "cruelly unjust" if he intimates that solid old Thomas was sometimes a trifle slow?

Gen. Boynton, and not Sherman, is responsible for the production of the despatches which would seem to tell against Thomas's activity, but they are valuable parts of the history. Thomas's reputation is established on such a basis that it is quite unnecessary to support it in the manner of the chapter we are noticing. Were it less assured, Gen. Boynton's defence would be damaging. The attack on Kenesaw was not renewed, and Sherman, as we learn from the despatches now produced by Gen. Boynton, asked Thomas if he was willing to try the flank move on Fulton. Thomas does not answer categorically, but says that if it be made "with the greater part of the army, I think it decidedly better than butting against breastworks twelve feet thick and strongly abattised." Sherman replies, "Go where we may, we will find the breastworks and abattis, unless we move more rapidly than we have heretofore" (p. 117). To call Thomas's despatch an approval of Sherman's plan is an abuse of language. Gen. Boynton says it is "exceedingly suggestive"; yes, to the very verge of insubordination; and Sherman's sincere friendship for Thomas could not be better manifested than by his taking no other notice of its reference to the assault on Kenesaw than by his retort on the score of slowness. We are sorry Thomas wrote the despatch, but the "truth of history" justifies Gen. Boynton in publishing it.

On the subjects of Sherman's reference to Blair and Logan as "political generals," and of his controversy with Stanton and Halleck over his truce with Johnson, we see no reason to add to what we have said in our original review of the 'Memoirs.' A few words on the planning of the march to the sea must close what we have now to say. General Boynton shows clearly enough that Grant had suggested a move upon Mobile after Atlanta should be taken, and that after the fall of Mobile he suggested a move on Augusta, while troops should go by sea to operate on Savannah. But neither of these movements has any resemblance in military principle to that which Sherman actually made. To go to Mobile was only to cut off another Western slice from the Confederacy, and in doing it Sherman would remain in his own department and in communication with his own detachments and his own bases of supply. To go to Augusta implied a campaign on similar conditions, and in each case Sherman's army would operate as a whole, and Hood's army would be his enemy in the field. The conception of the Savannah campaign is *toto cœlo* different. It involved the division of Sherman's army, leaving Thomas to keep Hood busy and defeat him, whilst he with the rest of his forces cut entirely loose from his base and struck for the sea, so far eastward as to divide the Confederacy in the middle, destroying railways to such an extent as permanently to interrupt any valuable communication between the Atlantic and Gulf States of the Confederacy. It was bringing the war to a grand crisis at once. There is no strategic resemblance between this plan and either of the others, and, like Marlborough's march to Blenheim, or Napoleon's to Berlin, it was followed by magnificent results; and if, as in Napoleon's brilliant campaign, it was won more by the legs of the soldiers than their arms, so much the better. Either of the other plans might have been good, neither of them could be great. We can find nothing in the written evidence furnished by General Boynton to lead us to any other conclusion than that we have stated.

Only one point is left. Did Sherman leave Thomas to do his work with insufficient means? To this the "record" answers that the force, when concentrated, was superior to Hood's; that Schofield was able to hold Hood back till the concentration was effected, permanently crippling Hood's army at Franklin with only a fraction of Thomas's; that Schofield thought there were troops enough to "whip Hood easily" (p. 181); that Thomas himself thought so (pp. 185, 186); and, finally, that Thomas did, in fact, conquer Hood easily, completely, and gloriously. Therefore, he had troops enough to do it. Q. E. D. Would he or any of his admirers (and they are the whole nation) now wish that Sherman had not left him to do that work? Injustice was done Thomas by the authorities at Washington, though inadvertently, in not giving proper weight to the circumstances which prevented his earlier attack on Hood at Nashville, and there is room for a difference of theoretic opinions as to whether a more vigorous action in November would not have been successful. The mass of documents quoted by Gen. Boynton seem to establish the fact that Gen. Thomas's general reputation was that of being rather slow, and that the nervousness at Washington was caused by this belief. But to be rather slow was quite consistent with being a most noble man, and with adding to Sherman's campaign the "crowning mercy" of Nashville. We cannot find in the "record" anything inconsistent with this friendly view of Thomas's character and achievements, and must therefore acquit Sherman of both injustice and jealousy.

Several minor topics might be profitably discussed if our space permitted, but we must stop here. Pending the publication by Congress of all the war records, Gen. Boynton's painstaking compilation from the files will have real historic value; but we must in candor repeat, that one of the chief points of that value will be the essential aid it gives in demonstrably refuting the charges against Gen. Sherman which his book was intended to prove.

## BARCLAY'S SHIP OF FOOLS.*

ALIKE under a literary aspect and under a philological, the writings of Alexander Barclay have an importance which has hitherto been inadequately acknowledged. His principal work, that specified above, now accessible to the world in sumptuous typography, though in name a translation only, is really one of the most noticeable contributions to English verse that can be mentioned between Lydgate and Spenser. Nor is its author without valid claims on the attention of the thorough student of our mother-tongue. His chief merit, particularly in his 'Sallust,' consists in his employment of numerous Latinistic expressions, which, though of rare

* 'The Ship of Fools. Translated by Alexander Barclay. Edited by T. H. Jamieson.' Edinburgh: William Paterson; London: Henry Sotheran & Co. 1874. 2 vols. 4to.

occurrence in the literature of his predecessors and contemporaries, have long since, for their utility, been permanently naturalized. Much as has been done of late years towards investigating the English which intervened between Chaucer and Sidney, we are, in our acquaintance with it, barely better than beginners. To the period in question belongs Barclay ; and no philologist who would form a correct idea of our language, as exhibited at its best in the time of Henry VIII., can dispense with poring over his pages diligently. Our lexicographers, it is true, have to a man substantially ignored him. But who among these sciolists has evinced, as to our literature in its full compass, any knowledge of it other than the most superficial ? To Dr. Johnson, even in Shakspere's time, the English nation "was yet struggling to emerge from barbarity." As he distinctly tells us, little of the English language of an earlier date challenged his notice. That, therefore, he should have contented himself with a mere quotation from Barclay, in the "History of the English Language" prefixed to his 'Dictionary,' is all that could be expected. At the same time, in his ignorance of Barclay, he pronounces that he "wrote about 1550."

The nationality of Barclay has long been litigated ; and it is still somewhat uncertain, and is likely so to remain, whether he was born to the north of the Tweed or to the south. His patriotic editor attempts to support the position of his being a Scotchman by adducing certain words from Barclay which he assumes to have been peculiar in his time to Scotland ; alleging that they "indicate at once the clime to which they are native." Among these words, strangely enough, we notice *byde*, *gree*, and *ryve* for "abide," "agree," and "split," and we should not be surprised if it were shown that the obsoletisms which are associated with them, as, for instance, *kest*, *thekt*, and *yate*, for "cast," "thatched," and "gate," belong to the same category. But whatever the place of Barclay's birth was, its time, of which we have no nice particulars, must have been about midway in the latter half of the fifteenth century. His education, at least as regards his university, was undoubtedly English. It is, however, a question whether he was at Cambridge or at Oxford. His calling was that of an ecclesiastic. Certainly a member of the Benedictine brotherhood, he may afterwards have attached himself to the Franciscan. In his will he styles himself Doctor of Divinity. He survived the Reformation, but without turning Protestant, and died at Croydon, where he lies buried, in 1552.

The career of Barclay, as far as has been ascertained, was marked by no incidents of note. Being not only a right-minded and upright man in a most corrupt age, but choosing to lash unsparingly the vices by which he was surrounded, he could reasonably reckon on but a meagre share of what is generally counted as success. In passing, the charge brought against him by the foul-mouthed Bishop Bale, utterly unsupported as it is by corroborative evidence, may be dismissed as pure aspersion. How little Bale knew of him may be inferred from his calling him "Quene Maryes chaplayne," whereas Queen Mary did not come to the throne till more than a twelvemonth after he was laid in his grave. Having spent in his early manhood several years in Germany, Italy, and France, Barclay entered the Church. Patrons, though he was quite the reverse of a courtier, he did not indeed lack, and he was prompt in giving proofs of his unmistakable ability. Yet circumstances, which in all likelihood he himself created, conspired with his inflexible rectitude of principle to prevent his rising to eminence in his profession. Until he reached old age he attained to no preferment but the most moderate. For many years he was simply a chaplain, or else a humble parish-priest in Devonshire, Essex, and Somerset, besides being attached for a while to the Monastery of Ely. In 1552 he was presented to the rectory of All Hallows, Lombard Street, London, a living of considerable value, in the possession of which he died the very year it was bestowed on him. Long before this, in 1520, it was proposed to Wolsey by Sir Nicholas Vaux to employ his pen in the service of the state. That anything in the way of literary effort came from this proposal we are not informed. At all events, his worldly prospects do not seem to have been bettered by this momentary gleam of court favor. If he cherished the anticipation that his want of material prosperity would be compensated by the remembrance of after-days, that anticipation bids fair to be amply realized. As a remarkable instance of omission, by the bye (provided that Fuller did not take him for a Scotchman by birth), he is wholly uncommemorated in 'The Worthies of England.'

With the exception of 'The Introductory to Write and Pronounce French,' no original production of Barclay's is recorded to have come down to us. His first venture in letters was a poem from the French, 'The Castell of Laboure,' printed by Wynkyn de Worde in 1506, and subsequently by Pynson. The work to which, more than to all else that he accomplished, he owes his fame soon succeeded it ; and then came his five 'Eglogs,' 'The Introductory, etc.,' 'The Myrrour of Good Manners,' and his translation of Sallust's 'Jugurthine War.' The English version of Haython's 'Cronycle' has been conjecturally ascribed to him, as have been three less extensive performances, two of which are supposed to have perished. Bale's supplement to this list enumerates several works which, likewise, are thought to be no longer extant.

'The Shyp of Folys of the Worlde,' which came out in 1509, and was reprinted by Cawood in 1570, is nominally a translation. It is founded on the 'Narrenschiff,' written in the Swabian dialect by Sebastian Brandt, professor of canon law at Basel, or, rather, on Professor James Locher's Latin version thereof, which followed the original at an interval of only three years, in 1497. The former popularity of the 'Narrenschiff' is attested by the fact that, in addition to being speedily imitated in German, French, and Latin, it was three times turned into French, and also into Dutch and Low-German. The same year that Barclay brought it out in English verse, Wynkyn de Worde presented a translation of it in English prose, rendered by Henry Watson from the French of Jehan Droyn.

It is natural that the 'Narrenschiff' enjoyed, in its divers forms, marked favor with Brandt's contemporaries and during several succeeding generations. Its incisive satire on the fatuities and their agents, while in the main so general as to suit all times indifferently, abounds in specialties which give token that Brandt was a keen-eyed observer of the follies predominant in his own day. Moreover, though level to proletarian apprehension and appreciation, the poem has a freshness about it which we can easily believe was once equally attractive to the peasant and to the scholar. The mechanics of Strassburg, Basel, and Augsburg hailed it with delight ; Erasmus and Reuchlin were loud in their commendation of it ; and Hutten went so far as to speak of its author as "the new lawgiver of German poetry." The preacher, Gailer von Kaiserberg, we are told, utilized it in substitution for the Bible as a repertory whence to draw texts. Directly, it may have contributed nothing towards the inauguration of the era which we date from Luther ; still, it has aptly been described as "a product of the piety and morality of the century which paved the way to the Reformation." After his usual fashion, Barclay, in dealing with it, did not so much translate as paraphrase and adapt ; and he executed his task with skill so felicitous that his result never once suggests that he is delivering anything but his own mind. His editor, while omitting, to no one's loss, the Latin version which intersperses the editions of 1509 and 1570, has retained Brandt's numerous pictorial illustrations. Thanks to the talent of Mr. J. F. Reid, they are reproduced with a fidelity which deserves the most emphatic recognition. These illustrations, which must have conduced immensely to the attractiveness of the original poem, even now have enthusiastic admirers. Some of them, in fact, are reckoned among the finest woodcuts of the fifteenth century. Evidently enough, they are productions of various artists, excellent and less than excellent, but never inferior. The best of them we owe, it has been suggested, to Martin Schön of Colmar.

Mr. Jamieson is well-nigh a perfect editor. His researches can have overpassed very little, if anything, touching Barclay to remunerate future explorers. His Introduction and his modestly entitled "Notice of the Life and Writings of Barclay" leave nothing to be desired ; and his "Bibliographical Catalogue of Barclay's Works" is a model in its kind. Barclay's own text he has given us, as we have satisfied ourselves by trial, with scrupulous exactness. The poet complains rather sorely of the carelessness of his printers, but, unfortunately, neglected to redress it by a table of corrigenda. The consequence is that we are, every now and then, somewhat perplexed. In Vol. II., page 258, there is the verse : "In wantonness, or in to and granyte." Here, to make either sense or metre, the *and* must be deleted. In cases like this, editorial notes would not have been unwelcome. Again, as to the Glossary, very helpful as it is, we could wish it a little fuller. For example, *tachyd*, "blemished, spotted," is entered there, but we miss *attachyd*, in the same sense, which occurs in Vol. II., page 185. It is worth remarking that *attache*, from signifying "blemish," came to signify "impute fault," "blame," "impeach." Lord Berners gives it this meaning, and so, pretty clearly, Shakspere does in his "*attachèd*, not attainted," and in the passage where modern editions put *attask'd*, modernized from the Second Quarto's *attaskt*, an error of the press for the *attasht* of some ignorant scribe who wrote the Gallic *attacht* as he heard it sounded.

The liberal spirit which penetrates the comments of Mr. Jamieson is highly praiseworthy. In a land where "prelacy and papacy" are, for the most part, held in prime abomination, it is gratifying to come upon a man who grants sterling virtue and merit to be a possibility in a son of Rome. As concerns his style, it is a pity that he should mar its excellence by the admission of such words as *locale*, *morale*, and *sordour*. His *that* for "because," and *laid past* for "laid by," are more easily condoned.

There are but few Scotchmen, just as there are but few Americans, who can so use English as not to indicate their nationality.

*Four Thousand Miles of African Travel:* A Personal Record of a Journey up the Nile, etc. By Alvan S. Southworth. (New York: Baker, Pratt & Co. 1875.)—One day, as the author of this volume was indulging in a reverie in the vestibule of the Grand Hotel in Paris, he was tapped on the shoulder by a friend and invited to stroll down the Boulevard. He assented, and the two gentlemen "met acquaintance after acquaintance, bowing and passing on." At last they were stopped by a "portly man" who had been in Egypt, and who talked about that country with such gusto that they all grew hungry. Hereupon they went to Bignon's to dine and drink Chambertin, and then Mr. Southworth, having made known to "Mr. Bennett" that he desired to see Egypt, he was "directed toward the East." At Cairo he found that "the Viceroy wished to Americanize his people." This circumstance is remarkable, inasmuch as, according to the author's ingenuous statement on the next page, the Americans "have preyed upon his fortunes, and have put upon him machines that are dead to action, guns that will not fire, and instruments which can be employed only to measure the highest altitude of swindling." Mr. Southworth has an immense admiration for the Viceroy, whose merits he sets forth in many glowing passages, and an exalted opinion of the future greatness of Egypt when the country shall have been thoroughly Americanized. He had an interview with the viceregal Minister for Foreign Affairs, of whom he gives the following description: "He was a man of about forty-two, an Armenian Christian, bold swarthy face, pleasant manners, and even handsome. He impressed me as a very competent minister, and one not apt to expand himself in a silly enterprise." Mr. Southworth's style is, it must be said, sometimes rather odd, as, to take another instance, when he speaks of Egypt as a "hermaphrodite land, half savage, half civilized." He also saw the Viceroy, the "Talleyrand of the East," whom he asked for a firman, and who, with admirable magnanimity, paid many compliments to the Americans. The author informed him that he wished to go up the Nile, "as a journalist, to ascertain Sir Samuel Baker's fate and to look at the country with liberal eyes." Mr. Southworth's admiration for Sir Samuel Baker is extreme, and is apparently only equalled by that which he feels for Lady Baker—her "beautiful little white teeth" and her "great Hungarian heart." He sailed up the Nile in a magnificent dahabeah, and at the end of 800 miles disembarked and crossed the Nubian Desert to Berber—having "accomplished the trip from Cairo in the shortest time ever made by white men." Mr. Southworth's description of his days in the Desert—days apparently of almost intolerable physical discomfort—contains the most graphic and successful pages in his book. Under the influence of some extraordinary delusion, he and his companions had determined to take no wine nor liquor with them on their journey. Mr. Southworth must have longed for that Chambertin at Bignon's. He resumed navigation, and continued on to Khartum, where he spent the last of the winter and the spring. His residence in this capacious city of 40,000 inhabitants appears to have formed the limit of his researches into the fate of Sir Samuel Baker. He seems on this and other occasions to have conceived large designs, which were defeated by circumstances over which he had no control. While at Khartum, for instance, he was firmly resolved to penetrate to the sanguinary kingdom of Darfur—"from whose bourne no traveller returns." But he thought better of it. So also, later, on the Red Sea, he met a Turkish nobleman, to whom he made a "serious proposition" that for the sum of $500 he should conduct him to Mecca in disguise. But the "nobleman" afterwards backed out, and Mr. Southworth had to content himself with visiting the "tomb of Eve" at the convenient distance of two miles. He observes after seeing this remarkable monument—it is near Yeddah, and two hundred feet long—that "to keep a 'tomb' is one of the most flourishing occupations of the East." At Khartum, wishing to investigate the mysteries of the slave-trade, he pretended to desire to purchase "a small thirteen-year-old Abyssinian." "She was covered," he says, "with a single loose garment. She was directed to denude herself of this; but I instantly interposed, not wishing to allow even a traveller's curiosity to insult the child's purity of person." He has much to say about the slave-traffic and those explorers who "have sought to *deprecate* the minds and persons of these helpless people in different parts of the African continent, and have been ostentatious in proclaiming their uselessness as human factors." At the end of his five months in Khartum the author sailed down the Nile to Berber again, and crossed the Desert to the Red Sea. In speaking of the number of wild beasts in Central Africa, he says: "As the reader, however, can best judge by figures, I will make some instead of taking them from the census-takers." And he proceeds to "make" them, and to state that for every human being of the population there are 100 monkeys, 50 lions, 50 antelopes, 1 elephant, etc. Mr. Southworth is, we regret to say, Secretary of the American Geographical Society.

*Men of the Time.* A Dictionary of Contemporaries, containing notices of Eminent Characters of both sexes. Ninth edition, revised and brought down to the present time. By Thompson Cooper. (London and New York: Geo. Routledge & Sons. 1875.)—The world will never lack for geniuses to "shine in the sudden making of splendid names," and no dictionary of contemporaries, we may suspect, will ever quite anticipate them. Between times, some one is sure to become an "eminent character" whose name has not been already embraced in the dictionary. And since to journalists at least the value of such a work as Mr. Cooper's is perhaps quite as great for the purpose of obituary as of information about the living, it is worth noting how often death itself makes eminent the retiring or obscure. We had occasion to remark this in the case of the late Prof. Cairnes, whose name does not appear in this ninth edition, though it was issued some time before his death. Of course he had been neglected in former editions, for the rule may well hold—once a "man of the time" always a "man of the time." In the British domain such shortcomings are naturally rarer than in the case of any other nation. The American biographies, too, have been entrusted to good hands, and are full, so far as we have examined them accurate, and above all impartial. They, as well as any others, may show to what date the present edition has been brought down: Gen. Sherman, it is said, is talked of as Presidential candidate for 1876; Gen. Butler, in 1871 and 1873, vainly endeavored to secure the Republican nomination for Governor of Massachusetts; Mr. Beecher had been acquitted by his church committee, but had been sued by Mr. Tilton, etc. Perhaps one might quarrel with the criterion which admits Mr. Bret Harte and omits Mr. Howells—an older soldier, if not a better, in literary service. And whether Mr. Henry Stanley is to be counted as an American or not, he has certainly earned a place among "men of the time." To be sure, neither the African explorers, Rohlfs and Bastian, nor the Asiatic traveller, Baron Richthofen, finds mention here. And generally, the German field seems rather slighted. Though we have Count Arnim, we miss his eminent counsel, Von Holtzendorff, and the eminent leader of the National party, Lasker. In literature, no mention is made of Corssen (since deceased), or of Treitschke, not to speak of a lighter intellect like Julian Schmidt; nor any, in philology, of Bergk, or, in lexicography, of Daniel Sanders, or, in science, of Haeckel. Among Italians, the weighty name of Bonghi is wanting; among Frenchmen, the late S. B. Carpeaux; among Russians, the two Tolstois and Turgenef. Some of these public characters deserve to be taken into a new edition, and unhappily, the deaths, even in the very year of publication, leave numerous gaps for those who have been for one reason or another kept without. A capital feature of this edition, by the way, is a necrological list, at the end, of the "men of the time" recorded in previous issues, giving the dates of their birth and death, and a reference to the edition in which they figured when alive. The volume, whatever its omissions, contains upwards of a thousand pages of biography, and we hope will not be the last of a very useful and almost indispensable series.

*Bibliographie Moliéresque.* Par Paul Lacroix. (Paris: Fontaine; New York: J. W. Bouton. 1875.)—M. Paul Lacroix, seeing that Shaksperian bibliographies are common, and that there is a Shaksperian library and museum at Strasford (*sic*), and believing that Molière is "at least the equal of Shakspere," has just published a second edition, entirely rewritten, of the work whose title is given above. It is a bulky octavo of over four hundred pages, with an excellent index, and a portrait of Molière etched by M. Ad. Lalauze, after the painting attributed to Lebrun, which was destroyed by fire in the Municipal Museum of Paris in May, 1871. It contains 1,753 numbers, classified under forty heads. It endeavors to describe all editions, translations, and imitations of Molière's works, including the poems and plays, separate and collected; all books about his works, his life, his wife, his theatre, and his company; all autographs; all prose and poetry written in his praise and dispraise; all plays written about him, for him, or against him; and, in short, all matter anecdotical, biographical, bibliographical, philological, and literary about him, either in print or MS. To the descriptions of the original editions and of some of the rarer reprints are appended notes giving the prices at recent sales, and showing the rapid rise in value within twenty years. Thus, a copy of the first of Molière's comedies which was printed, 'L'Estourdy, ou les Contre-temps,' in 1654

was worth ninety francs; in 1873 it was held at twelve hundred francs, unbound.

Work like this, from so ardent a lover of Molière and so accomplished a bibliographer as M. Paul Lacroix, is of necessity well-nigh perfect, but its comprehensiveness prevents the possibility of completeness. An attempt to catalogue all writings, even articles in magazines and daily newspapers, about an author as universally studied as Molière, must be hopeless, especially in regard to works in a foreign language. With great typographical variety, M. Lacroix gives the titles of translations into twenty-two languages, including Polish, Servo-croatian, Russian, Roumanian, Latin, Greek, Turkish, Persian, Armenian, and Magyar. The English translations and imitations are contained in twenty-seven numbers. Except an occasional typographical error, the faults in this list are of omission, not commission. Lowndes's 'Manual' has been carefully followed, but M. Lacroix seems not to know of the 'Biographica Dramatica,' which would have given him much valuable information. The history of the powerful influence Molière has had upon the English stage is well worth tracing. The editor of the new English translation, of which only one volume has yet been published, Mr. Van Laun, gives in it a list of over twenty English authors whom he has found either building upon the foundation or using the bricks of Molière. M. Lacroix mentions Cibber's 'Non-Juror,' but omits Bickerstaffe's 'Hypocrite,' the only one of Molière's plays in English which keeps the stage to this day, and of which an American edition, compressed into three acts by Sol Smith, comedian, forms No. CV. of the 'Modern Standard Drama.' He gives Mr. Charles Reade's translation of 'Le Malade Imaginaire,' but does not mention its performance in 1870, as the 'Robust Invalid.' Mr. Marcus Clarke, of the Melbourne Public Library, is the author of 'Peacock's Feathers,' a version of 'Le Bourgeois Gentilhomme,' which has been successful in Australia. Nor is any mention made of Dryden's 'Amphitryon,' recently revived in England, with modifications by Mr. John Oxenford. Lady Bulwer's 'School for Husbands' is also omitted. The short list of English magazine articles could be easily extended by consulting Poole's Index and the pages of the *Living Age*. Particulars of the popularity of some of Molière's plays among the frequenters of the English fairs during the early years of the last century will be found in Frost's 'Old Showmen and the Old London Fairs' (London: Tinsley Bros., 1874), at pp. 107, 111, 127, 133, 143, 163. M. Fontaine announces as in preparation for immediate publication similar bibliographies, devoted to Corneille and Racine, by M. Émile Picot.

*** Publishers will confer a favor by always marking the price of their books on the wrapper.*

NEW YORK.

A CHRISTMAS GIFT.

Persons wishing to obtain a *sensible gift* for friend can buy our

*ENGLISH CLASSICAL LIBRARY,*

Comprising 13 volumes.
Over five thousand pages Classic Literature.
Byron, Burns, Hemans, Thomson, Shakespere, Cowper, Wordsworth, Scott, Milton, Pope, Moore, Goldsmith, Tennyson's 'Queen Mary,' sent free by mail on receipt of four dollars and forty cents and ten three-cent stamps. These are the cheapest books in the world. Each book contains the entire poems of the author named, portrait, and index, without abridgment, being the cheapest books ever printed. These books are exactly what we represent them to be; they are not abridged, condensed, or made up in part, but each book is the *complete poetical Works* of the author named.

HAZZARD & SON, Publishers,
Monongahela City, Pa.

*THE QUARTERLY ELOCUTIONIST.* $1 per year. ANNA RANDALL-DIEHL, Publisher, 27 Union Square, New York. Send 25 cents for the January number, now ready.

*Incomparably the Best,*

And the only Unabridged, Enlarged, and Corrected Edition of

DR. WILLIAM SMITH'S

*Dictionary of the Bible,*

Comprising its Antiquities, Biography, Geography, and Natural History, is that Edited by

Prof. HORATIO B. HACKETT
and EZRA ABBOT, LL.D.

"In short, it seems that we have to thank America for the most complete work of the kind in the English or, indeed, in any other language."—*London Bookseller.*

The grounds of its superiority to the English edition of the same work are these:

500 more pages and 100 more engravings in the American edition than in the original English.
26 American scholars represented.
More than 1,000 errors of reference corrected.
An Index of Scripture Illustrations, 56 columns, in the American edition only.

4 vols. 3,667 pages. 596 illustrations.

*Price.*—In cloth, bevelled edges ..... $26
In full sheep ..... $30 | In half-calf, extra ..... 36
In half morocco ..... 35 | In full calf ..... 45

HURD & HOUGHTON, New York.

*4th Clearance Catalogue*

of 5,000 Choice Books, at 30 to 50 per cent. below Publishers' prices.

Great bargains in good books. Catalogue free to any address. ESTES & LAURIAT,
301 Washington Street, opp. Old South, Boston.

*LONGFELLOW.*

*A Superb Life-size Portrait of the Poet LONGFELLOW will be sent with the ATLANTIC MONTHLY for 1876 to any person remitting $5 direct to the Publishers.*

THE PROGRAMME OF THE

*ATLANTIC FOR 1876*

Includes contributions from the ablest and best writers in the country. LONGFELLOW, LOWELL, HOLMES, and WHITTIER will furnish as hitherto, their latest and best productions to the public through the *Atlantic*. WARNER and ALDRICH will write of Eastern and Continental Travel; GEN. HOWARD will give his recollections of Gettysburg and other famous battles of the war; and MARK TWAIN will contribute some of his immitable papers. MR. HOWELLS'S story, "Private Theatricals," MRS KEMBLE'S "Old Woman's Gossip," and MR. ADAMS'S papers on "Railroads" will be among the special features of the year, and new attractions will be constantly added.

TERMS: Single or specimen numbers, 35 cents; yearly subscription, $4, postage free; with life-size portrait of Longfellow, $5.

Remittances by mail should be sent by a money-order, draft on New York or Boston or registered letter, to H. O. Houghton & Co., Riverside Press, Cambridge, Mass.

H. O. HOUGHTON & CO., Boston;
HURD & HOUGHTON, New York.

*THE PROBLEM OF TURKEY IN EUROPE.*

THE first trustworthy account of the origin, importance, and tendency of the Rebellion of Herzegovina, by one who is thoroughly familiar with Continental politics, will appear in the JANUARY Number of the

*INTERNATIONAL REVIEW.*

A. S. BARNES & COMPANY, Publishers.

*'THE READER" CRITICISES* on page ii a reproduction of the old translation of Plutarch's Lives by Sir Thomas North, edited by the Rev. Walter W. Skeat, and just published by Macmillan & Co.

# The Nation.

*NEW YORK, THURSDAY, DECEMBER 9, 1875.*

## The Week.

THE President, in his message, congratulates the country on the material, moral, and intellectual advance made in the last hundred years, and at the same time warns it that the preservation of free institutions depends on the education of the masses. He proposes for this purpose a constitutional amendment, making a free school system compulsory in each State, forbidding the teaching in such schools of "religious, atheistic, or pagan" doctrine, or the granting by any authority of school funds to any sect or denomination. He also discusses the question of taxation of church property; estimates the present value of such property exempt from taxation in the United States at $1,000,000,000; suggests that these vast accumulations, constantly increasing, may lead to sequestration "through blood," and that they should be taxed. With regard to foreign relations, the aspect of affairs is on all sides peaceful. The President discusses the Cuban question, and shows, in some very carefully-written passages, that the condition of the insurrection, as a matter of fact, is not such as would warrant either a recognition of the independence of the Cubans or of their belligerency; declares, however, that should the rebellion not be brought to a close by the acts of the parties themselves, and should the evils resulting from it continue, "mediation and intervention" will be the only course left open to "other nations." The good offices of the United States, already offered to Spain, not having been accepted, and the state of affairs on the island not having improved, the President thinks that something must soon be done; renews his offer of good offices; says that Spain has recently submitted to Mr. Cushing "certain proposals which, it is hoped, may be found to be the basis, if not the actual submission of terms to meet the requirements of the particular griefs of which this Government has felt itself entitled to complain"; refers to the "renewed efforts" being made to introduce reforms into the internal administration of the island; declares that the "interests of humanity" demand the cessation of strife; and promises, should the present hopes of an amicable arrangement be disappointed, to make a further communication to Congress at a period "not far remote."

With regard to the Mexican raids, he expresses the hope that the presence of an armed vessel on the Rio Grande may do some good; advises an extension of the sessions of the Alabama Claims Court; discusses the telegraphs and American citizenship and other minor matters; strongly advises the withdrawal of the legal-tender quality of the notes of the United States after a fixed date—"say not later than January 1, 1878"; the enactment of provisions for the redemption of greenbacks at a rate not in excess of $2,000,000 monthly in 3-65 bonds; and the grant of additional powers to the Treasury for the accumulation of gold, and with a view to this end the re-enactment of the tea and coffee duties. The questions which he recapitulates as of "vital importance" and needing immediate settlement, are—1st, Compulsory education; 2d, Secularization of the schools and the disfranchisement of all illiterate citizens after 1890; 3d, Separation of church and state and taxation of church property; 4th, The expulsion from the country of "licensed immorality" (*i.e.*, polygamy and women imported for improper purposes); 5th, Resumption. With regard to the telegraphs, he lays down the following principles as those on which legislation should be based: 1st, Reciprocity with regard to landing of foreign cables on the shores of this country; 2d, Prohibition of all forms of combination; 3d, Precedence of Government messages; 4th, A reservation by the governments which grant the privileges of a right to limit the charges. As to citizenship, he notices the abuse of fraudulent naturalization papers, and urges the enactment of laws providing means for the vacating of any fraudulent record, and punishment of the guilty parties, as well as measures definitely providing for the denaturalization of citizens who abandon their country permanently; and also laws for the regulation of the status of American women marrying foreigners, as well as of children of American parents born abroad; and suggests the necessity of measures for giving effect to or regulating marriages of American citizens contracted in foreign countries.

The Democratic caucus met on Saturday and nominated Mr. Kerr as Speaker, the Randall party practically giving the contest up after the first vote. We have discussed the meaning of this nomination elsewhere. The two branches of Congress were organized on Monday, and Mr. Kerr was elected Speaker of the House. A question arose as to the admission of the Louisiana members, the fifth district being represented by two claimants—the Republican, Morey, having a Kellog certificate, and the Democrat, Spencer, having one signed by McEnery. The Wheeler Compromise of the last session having ratified the election of Kellogg, by common consent of all concerned, there was no question that McEnery certificates were so much waste paper, and Mr. Blaine, who led the Republican side of the House in the debate which ensued, explained this with a great deal of force, while Fernando Wood tried to have the question referred to the Committee on elections. This would necessarily have raised the ghost of the Louisiana question, supposed to have been laid for ever by the Wheeler Compromise, and the best of the Democrats immediately began to work hard to defeat the proposition. The discussion led to the first voting of the session, in which Mr. Kerr seems to have shown his unfamiliarity with parliamentary law by ordering a division on a call for the yeas and nays, but on the whole he succeeded very well. The only other business was a motion, carried by Mr. Randall, to repeal the two rules adopted by the Republicans at the last session to prevent filibustering. This act of virtue seems to have taken the opposition by surprise, and the Republican newspapers generally are forced to admit that the Democrats have made a good beginning.

Morrissey has been in Washington taking an active part in the preparations for the election of the Speaker, and "selling pools" on that event; and we have his own word for it that "selling pools" is his regular business, while politics is the amusement of his gentlemanly leisure; that is, he bets on the election, in the ordinary pursuit of his calling, and then supports his bet by vigorous lobbying. There would be something very irritating in his appearance in the National Capitol at such a time as a wielder of great influence, or a very important personage, if it was not on the whole justified by the late election. He went to Washington with the honors and strength of a man who had his own State at his back. He has been sent to the State Senate by the votes of a very respectable portion of the inhabitants of his own city. Better endorsements no politician can well have. Nevertheless, the thing is so ludicrous and shameful that we trust it will set people thinking, and that they will ask themselves seriously whether they think boss-government, tempered by biennial vituperation, is sufficient for the needs of a community like this city, and will consider hereafter, before election, the probable indirect as well as the probable direct effects of their voting.

A large number of telegrams, of a very suspicious character, either addressed to General Babcock, the President's private secretary, or received from him, have been produced on the trial of Avery, the Chief Clerk, in the whiskey cases at St. Louis, as evidence against him. Babcock, it is to be presumed, was duly

apprised of their approaching production, and the prosecuting counsel, Mr. Henderson, said distinctly in his address to the jury that they left no doubt of Babcock's complicity. Under these circumstances, the obvious course for General Babcock, if innocent, was to hurry on to St. Louis, present himself as a witness for Avery, and explain the telegrams. Instead of this, however, he contented himself with telegraphing that he was entirely innocent, and then turned round and demanded a military court of enquiry, which has been granted him, on the ground that he is a colonel of engineers. But, then, he has been detached from the army for seven years for civil duties, and it is as a civil officer that he has mixed himself up in the whiskey frauds, if at all, so that his having himself tried as a colonel of engineers is absurd, unless he uses the word "engineer" in the sense in which the politicians use it. The court of enquiry, however, cannot interfere with the ordinary course of justice, nor can it procure the evidence on which the charge against General Babcock is based, as this is in the hands of the Grand Jury at St. Louis. The Grand Jury, it is said, have now indicted him on it.

---

The remains of the late Vice-President reached their last resting-place on the 1st inst., after having passed a week on the way in a kind of prolonged "wake," during which the funeral ceremonies lost all sentiment and solemnity, and the eulogies became flat, stale, and unprofitable. A worse mode of doing honor to a man's memory could hardly be hit on within the range of decency. Mr. Wilson was hardly dead before the doctors, without the slightest necessity—for they knew he had died of apoplexy—made an "autopsy" on him, which is simply a fine name for dissecting him, and gave the reporters a disgustingly minute account of the condition of his internal organs. He was then exhibited as a curiosity in an open room to the crowds pouring in from the street, and finally carted from city to city to be made the subject of oratory and resolutions composed in the ordinary hollow obituary style, until the whole country was weary of the spectacle and was fast becoming ashamed of it. The only way of making the obsequies of distinguished men really impressive is to have them short and prompt, while the public feeling is still fresh, and then, when they are over, to bury the body without further parade. Funeral resolutions, too, greatly need reform. The drafters ought to take notice that the preamble which sets forth that God has been pleased to remove the deceased person is so very unnecessary as to have become offensive through much repetition, and that the first resolution about "bowing with resignation" has degenerated into cant, into which it is impossible to put any appearance either of reverence or affection.

---

The extracts which have been published from the correspondence of the State Department show in a curious way of how little practical use a permanent foreign mission may be. Ever since the beginning of the present complications with Spain, which date at least as far back as 1868, there has been more diplomacy of one kind and another with Spain than with any other country except England, and it is theoretically carried on, so far as the United States is concerned, by the resident Minister. As a matter of fact, however, the correspondence has all along showed that the negotiations were actually directed by Mr. Fish in person. General Sickles did in one case try to assume the management, and the result was that he was at once recalled. When Mr. Cushing went over, it was popularly supposed that he would take the war-path on his arrival and show the Dons the real state of the case in a way that would make them beg for mercy. He appreciated the real nature of his mission far too well for this, and has been apparently devoting most of his time to historical studies. In these studies he confines himself by preference to the remote past, and in one of his longest and most powerful despatches, under date of April 19, he gives a complete and painstaking account of the relations between Spain and the United States during the Revolution and the Napoleonic wars. "In meditating," he says, "on the aspects and chances" of our Spanish relations, his thoughts "naturally turn back to the antecedents of the subject"; and he proceeds to give an analysis of the policy of Charles III.—the "secret springs" of which he has discovered in the "works of two historical writers of authority, D. Andres Muriel and D. Antonio Ferrer del Rio"—and a touching description of his character, showing him to have had profound convictions of duty and to have been in the habit of repelling the crafty counsels of his courtiers by simply saying "that such a thing might be politic for a king to do, but not fit for Carlos." A tolerably full account of the reign of Charles IV. and Ferdinand VII. is given, the general drift of Mr. Cushing's history being, of course, in the direction of the surrender of the Spanish possessions in this country; but we are sorry to say that on reaching modern times, and what he calls "the great residuary question of the Antilles," he retires from the field and declines to discuss it at all. In fact, the whole despatch might have been written in the Astor Library by any intelligent man without the trouble of going to Madrid at all.

---

The Postmaster's report is not as satisfactory a document as we could have wished. It shows, as usual, a large deficit, and, though the administration of the office does not appear to have run down during the year, it is painful to have Mr. Jewell recommending the encouragement of American ship-building by "small subsidies" to American-built lines of mail steamers. We had supposed that everybody, but particularly the reform members of the Administration, recognized the fact that this is no time for squandering Government money in subsidies or railroad aid, or any other paternal way. It is not a year since the shocking revelations of the Pacific-Mail scandal showed us what subsidies in the present condition of the Government mean. The passion for improving the condition of the country by aid and grants of all kinds, however, seems to have become a monomania with a large part of the Republican party, and not even the best of its leaders escape without a slight touch of the disease.

---

This subsidy scheme of Mr. Jewell's, however, is not likely to come to much, and an act of his which will come to something, and is an evidence of his honest desire to purify his department of the Government, is the removal of Mr. Burt from the Boston Post-office. The condition of this office has been for some time a public disgrace. Burt was a great politician, and believed emphatically in managing the Post-office for the benefit of the party. He did not think there was any trouble with the civil service, and so he went on putting in clerks and employés who had "worked," until suddenly the Bostonians began to find that letters containing money, though willingly received by the authorities for transmission through the mails, by some mysterious means disappeared in the process; that letters were very apt to go to the wrong address; that there were great delays and many irregularities, and not a little stealing. On examination, it turned out that this was not unnatural, as among the "workers" were a good many gentlemen known to the police as suspicious characters. Matters went so far that a notice was one morning posted up, to the effect that persons taking letters out of their boxes not addressed to them, but to some one else, must return them, so that they might be sent to the proper address—a regulation which seemed to show that reading and writing were not one of the requirements among the clerks. In fact, the Post-office from a convenience became a public nuisance, and the Department have now allowed Mr. Burt to discover pressing business elsewhere, and are going to put Mr. E. S. Tobey, who the other day declined the Indian Bureau, in his place. The appointment will be an excellent one.

---

General Schenck has been caught in another scrape which looks as bad as or worse than the Emma-Mine business. Letters have been published that passed between him and Norman Wiard, the ordnance inventor, which show, if they are genuine (and no denial of their authenticity has been made), that Schenck has been "operating" as a claim-agent against the British Government for a few

years past. In July, 1871, Wiard, then partner with Schenck in the manufacture of ordnance, and holding a power-of-attorney from him, made a written agreement with one Machado, who had a claim of $350,000 against the British Government, to "use his best endeavors" to get the claim paid; and the contract expressly stipulated that if he (Wiard) succeeded in getting it settled "during the time General Schenck should be the Minister of the United States" in England, he should have one-third the award after deducting expenses, while if the settlement "should not depend upon the negotiation of General Schenck," or should not be concluded during his ministry, then Wiard should have nothing. Having made the contract, Mr. Wiard, who is evidently what is called in the play "a frank, open, straightforward, careless business man," sends a copy of it to Gen. Schenck, with a request that he will go to work at once, and the General in reply says that he will "see what can be done," but expresses much regret that his name "was put in," directs Wiard to burn his reply, and says that he will himself burn what Wiard had sent except the brief of Machado's American lawyers. Since the appearance of these documents the entire press of the country has united in demanding or urging or suggesting the expediency of General Schenck's recall. We observe that the *Tribune*, which, in connection with the Emma-Mine exposure, has been describing Mr. T. W. Park's character in strong language, has been sued by that gentleman for libel. Mr. Park puts his damages at $100,000; but the *Tribune* does not seem to be at all disheartened by this, and promises to give Mr. Park unhappiness enough before the trial of the action to make this valuation of his supposed damage fair and moderate. As it is now publishing accounts of some of Mr. Park's operations in the Street, it may be worth while to suggest that Mr. James E. Lyon should "come to the front" and tell what he knows about the Emma Mine. He was one of the original proprietors of the property, is an old mining prospector, was cognizant of many of the most important negotiations in connection with the floating of the mine, and has a long and interesting story to tell.

---

In the business world there has been little during the past week out of the usual course at this season of the year. The volume of trade has been fully up to the average, and there have been no more mercantile suspensions or failures than is customary. Money has been in full supply, with demand loans costing borrowers 4 to 6 per cent. The changing of loans at the beginning of the month, on account of the heavy payments into the city treasury for taxes, and the disposition of this money afterwards by the City Chamberlain, advanced the rate for demand loans for a day or two to 6 and 7 per cent. Wall-Street speculation in every department has been tame, speculators waiting for the appearance of the President's Message and the reports from the heads of Departments to Congress. The tendency of gold was downwards, and sterling exchange advanced. A feature of the latter market was that the bills of the house whose rates usually determine the market ruled lower than the bills of other "prime" drawers. The explanation of this is that this house, since the failure of Duncan, Sherman & Co., have had forced on them a larger share of the cotton business than they formerly did, and that their bills have accordingly been much more plentiful than formerly. In London, the Bank of England has continued to lose gold, the withdrawals having been for shipments to Paris and Germany. On one day over £600,000 was withdrawn, for the purpose, it was said, of making the first payment at Paris to Egypt for the Suez Canal stock recently bought by the British Government, although it is known that the purchase of this stock by the British Government must be approved by Parliament before it can become absolute. The London money market has been little affected by the changes in the bullion account of the Bank, and discounts are still obtainable in London at three-eighths to one-half below the Bank's lowest rate. The gold price of $100 greenbacks has ranged during the week between $86 72 and $87 62.

---

The motion for a "struck jury" in the Tweed case made by the prosecution was to have been argued on Monday, but Tweed, who has never shown any strong desire to have his case come to an actual trial, left the city on Saturday, after taking a drive in the Park. According to the story of his keepers, he was taken to his house in Madison Avenue after driving about, and there was allowed permission to go upstairs and see his wife. The keepers' suspicions were allayed by the fact that Tweed did not take his hat upstairs, and it was thought that he would hardly leave the city without it. This ingenious device was completely successful, and Tweed did not return. The officers in a few minutes sent for him, but he could not be found. The officers' theory of the case is that he escaped by walking out of the house, which is highly probable, if he was in it. The story of the officers, however, is not fully believed, and no one knows at what time or from what place Tweed did actually go. As he has been at large ever since he has been in confinement, the selection of the time and place for his departure was simply a matter of taste, and, instead of finding fault with him, it seems to us that we ought to be grateful to the "old man" that he has been willing to stay so long among us, giving a great deal of employment to some of our ablest lawyers and judges, and furnishing a constant topic of discussion for the press. His willingness to do so under the annoying circumstances of the past two years, shows that the place is still endeared to him by many associations, and if, instead of offering rewards for his arrest, proper inducements were held out, he would return at once. It can hardly be expected that a man will remain permanently in a city of his own accord where people are all the time denouncing him and threatening to take away his property or put him in prison.

---

The Centennial Commission have made very good selections in choosing Mr. Evarts as orator, and Mr. Longfellow as poet, for next year. It was greatly to be feared that the Commissioners would not be sufficiently conscious of the immense importance to the success of their undertaking of securing for these offices men who have a reputation throughout the whole country; and to have had all the nations of the earth invited here, during what it is safe to predict will be one of the most momentous years of our history, to listen to the windy rhetoric and commonplace of some local demagogue or "speaker," would have been a misfortune that no industrial success would have compensated for. Whatever Mr. Evarts may say, there is sure to be thought in it, and, besides this, he represents a school of distinctively American oratory which is fast dying out, leaving no one to administer upon its effects. Mr. Longfellow, too, is a poet distinctively American; all his most successful poems, from "Evangeline" and "Hiawatha" to the "Psalm of Life," have either been inspired by American subjects and written for American ears, or else are simple expressions in almost perfect verse of the universal aspirations, desires, hopes, and fears of our invited guests of next year—that is, of mankind.

---

The Brooklyn Scandal seems in a fair way to be revived through a dispute between Plymouth Church and two of its members over a question of discipline. Mr. West and Mrs. Moulton refuse to be dropped summarily from the list of members because of non-attendance without enquiry as to whether the non-attendance was justifiable, and it is now probable that the matter will be referred to a mutual council. Mrs. Moulton's letter to the church in her own defence contains a reiteration of her former story and an allegation that Mr. Beecher has perjured himself. It is mainly remarkable for its English, which is in a very unusual degree simple and clear, and shows, if she wrote it herself, the possession of a great gift. If she did not write it, it would be hard to guess who did, for none of the men who have taken part in the controversy have shown any rhetorical skill whatever of this sort. The literature of the Scandal has all, or nearly all, appeared in a strange jargon, which, to outsiders, is only partly comprehensible.

## THE SPEAKERSHIP.

THE contest for the Speakership at Washington has derived a great deal of interest from the fact that it was generally looked upon as likely to afford a good indication of the temper and quality of the Democratic majority in the House. The two candidates luckily represented what may be called the two opposing tendencies of American politics at this moment. Mr. Randall, an able and acute man, and perhaps the best parliamentarian on the Democratic side, but neither very high in his aims nor scrupulous in his methods, was put forward, or at all events supported, by what may be called the jobbing element in the party, both in and out of doors. Foremost and most conspicuous among his adherents was Mr. John Morrissey, who was fresh from his triumph in this city, canvassed actively for his favorite, and bet or offered to bet heavily in aid of his own predictions, and sold "pools" on the event, in order to give greater animation to the contest. He had, too, all that large class of persons who are interested in obtaining Government subsidies in aid of some sort of commercial enterprise, and notably Colonel "Tom" Scott, who seeks the Government guarantee for an enormous amount of bonds to be issued for the construction of his Texas Pacific Railroad; and, though last not least, he had the support of the high-tariff interest of Pennsylvania (for Mr. Randall himself is an ardent protectionist), headed by Mr. Simon Cameron, whose sympathies are by no means confined to the struggles of his own party. Mr. Randall, too, it ought to be mentioned, pocketed without scruple his share of the back pay—an act which, even if defensible on legal or moral grounds, was and is, under all the circumstances, the sign of a mental attitude with regard to the general political situation which is in the highest degree unfavorable to the wide and deep change, both in legislation and administration, now known to the public under the general name of reform. In fact, he represents fairly well the large and dangerous element in political life whose party differences are in name only, and who agree in considering the Government a bank on which a certain class of investors ought to be able to draw in all times of distress, who like the loose and good-natured mode of transacting its business, and who believe in the policy of using its offices to give increased zest to the political game as they play it, and who take a profoundly hopeful view of any state of things in which dexterity and astuteness and unscrupulousness give eminence and wealth. His election, therefore, would have confirmed the worst fears of those who look on the substitution of the Democratic for the Republican ascendancy in Congress as simply a perpetuation or aggravation of existing evils, or as their reproduction under a new form.

Mr. Kerr is entirely free from this class of associations. The only unfortunate point in his history is his opposition to the war, but he is by temperament and intention opposed to the whole system of jurisprudence and finance included under the term "paternal government." He is hostile to protection and to subsidies and jobs and unlawful stretches or uses of power for "fostering" purposes. His character, too, is of the austere, though somewhat slow and unready kind, which prevents a man's being a favorite with that enterprising but growing class of the community known as "the boys," whose sanguine disposition with regard to the probable yield of Government money when laid out in a patriotic spirit makes them very dangerous to the Treasury. There is probably, therefore, no man in the Democratic majority to whom a really genial man like John Morrissey or Fernando Wood, or hopeful and buoyant Republicans like Messrs. Cameron and Forney, would take less readily. As a presiding officer, Mr. Kerr will necessarily cut a poor figure coming directly after Mr. Blaine, but the same may be said in a greater or less degree of any man in the House, including Mr. Randall. Parliamentary practice is, however, something which may be learnt, and the Speaker's unreadiness, though an inconvenience, is not likely to prove anything more than an inconvenience.

All those, therefore, who are more interested in getting good government than in the name of the party under which good government comes, will rejoice heartily at the defeat of the base and corrupt element in the Democratic ranks. There is a large body of honest men in the Republican ranks to whom the result, or any result which puts the Democratic party in a more hopeful light before the country, is unwelcome, from the belief that salvation can only come from Republican hands; and this might be true if the opposition of the two parties were now based on mere difference of opinion on any great question of public policy, as it was during and before the war—if, for instance, one party promised if it got into power to enact black and the other to enact white. But the remarkable feature of the present situation is that there is really no difference of opinion between them; they utter the same cries, make the same pledges, produce the same tests and standards; so that the Republican orators and journalists are reduced, in attacking the Democrats, to throwing doubt on their professions, and to warning people that a party whose past history is so bad cannot be depended on to keep its fine promises. It does not seem to occur to those who use this argument, and who generally cultivate hopefulness as one of the first of political virtues, that the Democratic party, whatever its faults may be, comprises well-nigh half the American people; and that while it might err on the issues which at one time divided the country without impairing one's confidence in the political future, if it be now what its enemies say it is—that is, a collection of thieves and hypocrites—no efforts of rhetoric can prevent the national outlook from being exceedingly dark. A pro-slavery man might have had virtues which, slavery gone, would make him one of the most valuable of citizens; but a man who loves fraud and corruption, and is only shamming when he denounces them, cannot by any change of opinions become a useful member of a civilized state. If, therefore, the Democratic party were incurably corrupt, we might fairly consider the days of free government numbered on this continent, for the Republic lives, and must always live, not on the virtue of its best people, but on the average virtue of the whole mass. The Government could not be carried on by a population half rogues and half moralists; the average would be too low. Nor can the Republican party, however good it may be, stay good if the Democratic party be a combination of knaves. In fact, the very evils we are now deploring, and trying to remove, result from the mutual attraction of the bad element in both parties. Whether it has been more powerful on one side than on the other we do not care now to discuss; it is enough to say that the predatory organizations known as "Rings" which have now come to play so prominent a part in American politics, are composed almost invariably of men from both sides, and are only made possible by the fact that the standard of morality is much the same in both among the working politicians; and if the Republican party were to stay in power for twenty years longer, there would be no radical and permanent improvement in the tone of public life if the change for the better did not show itself in both parties.

For these reasons, we think reformers of all shades of opinion may heartily congratulate themselves on the signs which the opening of Congress has afforded that the reformatory influences are gaining strength and are likely to have the upper hand also in the Democratic ranks. The prevailing political evils strike at the very foundations of the Government; they are not questions on which statesmen are or can be divided. The situation is so pitiful, indeed, that personal honesty has become a boast, and a candidate's strongest card a promise that he will not steal, and an assurance that he has acquired his property honestly. The election of Mr. Kerr, therefore, is a formal announcement that an organization which controls nearly half the votes in the nation is, on the whole, opposed to the influences and agencies—whether subsidies, bounties, paper issues, want of discipline, bad modes of appointment, or feeble accountability—which, by making it easy for large classes to get money without honest labor at the market rate, help to maintain and diffuse the state of mind out of which corruption grows. We are by no means sure, however, that the Democratic party has become pure, or is composed principally of saints or sages; so that when we are told that the House Chaplain is an old Copper-

head, or that Mr. Fitzjohn Porter has put a barber to inspect sewers, we are not confounded. We are not of the number of those who believe that politicians, any more than other people, grow good suddenly; and we are quite certain that anybody who expects to see the work of reform now before us done quickly through a great moral awakening on the part of politicians, will be greatly disappointed. The poor fellows have to get back to the paths of righteousness, like the rest of the world, by a prolonged and bitter struggle with themselves.

## THE MORAL OF MR. SCHENCK'S CASE.

WE have no strong expectation that Mr. Schenck will be recalled by the recent exposures of his doings in London. He has himself every possible motive for remaining in office. The place has still all the attractions for him it ever had, plus the help which the appearance of continued support from his Government will give in trying to "vindicate" himself. In fact, he has, from his point of view, less reason for resigning now than he ever had, and it appears to be part of the settled policy of this Administration to let off all officers not proved guilty of downright fraud as easily as possible, and to allow them to withdraw from their posts at such time and in such manner as may cause them least disgrace. A sensitive man would have resigned after the bursting of the Emma-Mine bubble, from the feeling that even if his participation in that transaction was the result of thoughtlessness or indiscretion, his loss of reputation with the community to which he was accredited had been such as to destroy his usefulness. A man fit to be American Minister at the court of a first-class power would have felt this without having it explained to him, and would have promptly atoned for his error in the only way left him. But this view of the case probably never occurred to Mr. Schenck, owing to the very mental and moral defects which led him to accept Park's offer. Moreover, his allowing his name to be used by the stock-jobbers to put the mine on the market under any circumstances, but particularly when he himself was secretly guaranteed against all loss, was proof of a fatal want of perception of the exigencies of his position which ought to have led to his recall. Of course, the Government did not know that he was secretly guaranteed against loss, but they knew enough to tell them that he had not judgment enough for his place, and that in leaving him in it they ran the risk of fresh and perhaps worse scandals. If he had come home at first, he would have come home with the reputation of being an indiscreet man simply, and many people would have looked on him as a victim, and we should have heard no more about his transactions with Park or others. But if he now comes home he comes disgraced, because the exposure of his consenting to act as a common claim-agent in the Wiard case throws a light on his connection with the Emma Mine which makes it impossible to consider him any longer as simply a dupe. In fact, it is difficult to avoid the conclusion that when he went to England he was "on the make," as the politicians say, and was ready for almost anything that would increase his private fortune.

There is the same lesson for the Administration in his case that there is in so many other cases of official misconduct. In none of them has anything been gained by delay in removing the offender. In all of them the delay, so far from preventing scandal, has made an explosion more certain, and aggravated it when it came. But this delay is the natural consequence of the system of putting the personal favorites of the President in high places. A qualification of that kind is of course very elastic. It includes a great variety of persons and resists a great number of attacks, and brings into play in the management of the civil service a class of motives which are fatal to discipline. In that management personal friendship ought of course to play no part; but under our present system it plays a most powerful part, and may convert the chief officer of the Government into the warm supporter of a man at the very moment when the rules and traditions of good administration require him to be a cold and unrelenting judge. If you give a man a post because you think him fit for it, his dismissal follows naturally on your discovery of his unfitness; but if you give it him because you like him, the revelation of his unfitness assumes the character of a misfortune which increases his claim on your affection.

If this Schenck scandal fixes the attention of the public on the evils which follow the employment of the present mode of selection and appointment in the diplomatic service of the Government, it may prove a blessing in disguise. It is useless to try to conceal from ourselves that it has seriously damaged the reputation of that service in the very place in which it has hitherto stood highest—London, and damaged it, too, in the place where its reputation is most valuable—the greatest money-market in the world. What Mr. Schenck has done differs only in degree, and that not very greatly, from that which the Ministers of Honduras and Costa Rica and Nicaragua have done, and which has caused their expulsion from decent society in England. Of course, this is a misfortune, and it suggests naturally and almost inevitably the consideration whether, under the money régime on which we are now entering, and with a toilsome struggle against corruption in various forms before us, the abolition of the permanent diplomatic service would not be a useful measure of reform. With the Atlantic Cable to be used when necessary, and with respectable consuls at the leading points in Europe, there would be absolutely no need of permanent agents like Schenck, and their disappearance would effect our deliverance from many dangers and disgraces. They now serve no purpose that cannot be otherwise served except that of representing the country socially, and we do not deny that this work, if properly done—that is to say, by men like Mr. Lincoln's earlier selections, Messrs. Adams, Motley, and Marsh—is work well worth doing, and which might bear very valuable fruit in a dozen ways. But the social representation of the country should only be attempted by what is best in it, by men whose character and attainments are likely to give a true idea of what is most respectable and most respected in American society. If it is to be handed over to the agents of the rings and speculators and promoters of companies, and to be awarded to the cronies of the high officers of the Administration as a mark of personal esteem, or even to be used as a reward of campaign service or of unsuccessful attempts to get into or stay in Congress, every one must feel that it can be nothing better than a shame; and for the obvious reason that it would operate as a transfer to foreign soil of the very unpleasant "exposures" which are so prominent a feature in our home politics. These exposures now take place in the presence of friendly critics, who know exactly what is their value as symptoms, and who know how much there is in the national life to set them off or neutralize their effects. Made in London or Paris or Vienna, they become simply evidences of deep-seated corruption and debasement, and bring lasting discredit on popular government. We shall probably here have forgotten all about Schenck in a year; in London, he will be long remembered, and his memory will probably cover one or two of his successors with suspicions of which it will take a good deal of time to get rid.

The abolition of the whole service would entail no inconvenience whatever, and would in the majority of cases simply send politicians back to scenes of industry where they would be far more useful than they can possibly be in European capitals. In fact, the notion that a Western statesman, suddenly transferred to France or Germany, in entire ignorance of the language, laws, manners, history, and traditions of those countries or of any country but his own, can possibly be of any use to anybody but himself, is one of those illusions under which it is discreditable for the American people to lie any longer. When the practice of establishing resident ministers at foreign courts began, communication was slow and difficult, and they rendered important service in procuring information and in dealing with sudden emergencies. In our time there is no difficulty in despatching a special envoy to conduct any important negotiation, and the ordinary diplomatic corrrespondence can just as well be conducted through the post-office. The persons who would complain most of the change would be travelling Americans eager to

"go to Court"; but the fact is that the present system is not satisfactory to this class. They nearly all come home denouncing their Ministers in foreign capitals either for the badness of their character or their manners, so that even our gentility would not suffer by the withdrawal of our diplomatic agents. Indeed, the real business they do now is merely consular. When grave questions have to be settled with a foreign power, we are apt either to settle them at Washington or send out a special envoy in the person of a first-class man; and even when we have first-class men as resident Ministers, the Cable makes them simply the daily mouthpieces of the Department of State.

## ENGLISH FEELING ON THE EASTERN QUESTION.

LONDON, November 22, 1875.

"WHAT is confidently predicted never happens." If it were not for my confidence in the truth of this proverb, I would venture to predict that our next Parliamentary session will be a very different sort of thing from any Parliamentary session which we have had since the Crimean War. Home politics, to borrow an expressive phrase from your side of the Atlantic, are "played out." We have had a long-continued spell of domestic legislation and parochial, rather than Parliamentary, discussion. It began in the late Lord Derby's short Administration in 1858, lasted through Lord Palmerston's protracted reign from June, 1859, till his death in 1865, was continued by Lord Derby and Mr. Disraeli from 1866 to 1868, had a vigorous revival under Mr. Gladstone, and has flickered out its life during the last two sessions while Mr. Disraeli has been the First Minister of the Crown. Many large questions have been settled during these eighteen years of peaceful legislation, and many reforms, some beneficial and one or two pernicious, have been carried through. There is still no lack of work to be performed at home, but the country, it appears, desires an alterative, and is making inarticulate cries for change of diet. It is weary of well-doing, even in sanitary matters, and the supporters of the present Administration are urging on their chiefs to give them a higher policy than a policy of drainage, and a more inspiriting party watchword than "sanitas sanitatis, omnia sanitas."

And the circumstances of the time seem consonant with the humor of the country. I have been watching public opinion, so far as a private person not behind the scenes can watch it, during the last few weeks, both here and in Scotland, and I cannot fail to be struck with the uneasy feeling which pervades all classes with which I have been thrown in contact. It is difficult to gauge the strength of this feeling of uneasiness, but in character it is not dissimilar to that which existed two-and-twenty years ago when we were drifting into war with Russia, and it is of this sort—that in some shape or other we shall be face to face with serious complications before many months are over. However and wherever, in clubs or railway carriages or in private houses, the conversation commences, it always creeps round to the state of affairs in the East of Europe. The attitude of the three imperial powers has not tended to remove the feeling. None of us who are not in the secrets of diplomacy can understand the meaning of the triple alliance. Is it an alliance, we keep asking ourselves; and if so, with what end? Is it directed against any of the other European states—say Holland and Belgium and ourselves; and is it to preserve the *status quo* or to reconstruct the map of Europe? Is it no real alliance, but only one of those mysterious political relationships in which two of the partners are trying to take in the third? And if this is the explanation of it, which of the three is the dupe? Is it that Austria is to be led on the ice and in the end quietly dismembered, or can it be that Russia is to be lured into an impossible policy and Austria to be strengthened in the southeast, so as to form a buffer of strange confederated states between Russia and an United Germany? Prussia, we feel certain, is not the cat's-paw to the other members of the confederacy. The aggressiveness of Russia—the asseverations of not uninfluential English politicians notwithstanding—is always present to the British imagination, especially when the future of Constantinople is on the *tapis*. We are steadfast in our belief that the acquisition of the command of the Bosphorus is still the dream of no inconsiderable section of Russian statesmen. Nothing will shake our conviction on this point; and at the present time there is mixed up with a dread of Russian aggression an impression of insecurity, owing to the weakness of Austria and the Germanizing instincts of Prussia. The completion of German unity is the ambition of Prussia's greatest minds, of that we are well aware. The dual Government of Austria is, as we understand, regarded with anything but satisfaction by many of the German-speaking subjects of the Austrian Emperor. They see the want of any homogeneousness among the various nationalities with whom their fortunes are linked. They see that by this want of homogeneousness all state action is paralyzed, and their minds accordingly are filled with the pains of insecurity. And, while they see this at home, they look abroad at the German-speaking races across their frontier, and ask themselves whether they would not be better ranged alongside of their Teutonic brethren than jumbled up with Magyars, and Poles, and Croats, and Bohemians, and all the other incongruous races which make up the miscellaneous Empire of which they are but a fraction. In these yearnings of the German subjects of Austria for amalgamation with their brethren, in the desire of the ruling minds at Berlin for the completion of German unity, and in the ambitious dream of the older school of Russian statesmen, some English politicians think that they see the key to the triple alliance. Prussian neutrality guaranteed, France powerless, and Austria paralyzed, what is to prevent the early realization of the Russian dream? Russian neutrality guaranteed, France powerless, and the German section of the Austrian people not unwilling to rid themselves of the strange bedfellows to whom the exigencies of fortune have bound them for so many generations and to throw in their lot with their Teutonic brethren, what is to interfere with the accomplishment of Prussian ambition?

Nothing in either case, assuming the paralysis of Austria to be a fact, except Hungary and the Danubian Principalities on the one hand, and England on the other. The "Sick Man" hardly enters into the calculation. The stern fact of his repudiation of his debts has taken possession of the practical intelligence of the British middle-class, and has precipitated his fall in British estimation to a degree that centuries of misrule and wasted opportunities in his own Empire never could have compassed. This is perhaps a poor thing to say of one's countrymen, but it is true. One not uninfluential journal has tried to raise a bogus cry that the Sultan has gigantic power for evil in reserve, in respect that he can set a religious war on foot which will blaze throughout the whole Eastern Hemisphere. I do not think that the remote possibility of such a catastrophe will have much weight in the cabinet councils which are held almost every day in Downing Street—an unusual activity at this period of the year which is not without significance.

We are fast coming round to the opinion that the days of the Turkish Empire, in Europe at least, are numbered. But what to put in its place? There are some among us who think that the inhabitants of those wild states on the banks of the Danube—Servia, Bulgaria, and Roumania, and the inhabitants also of Bosnia, Montenegro, and Herzegovina—have so profited by the last twenty years, since the Russian power was checked, that they are now sufficiently civilized and politically educated to establish a confederation of their own, and reclaim the Turkish Empire, or what may be left of it, from the fallow uselessness of centuries. But these, I fear, are sanguine politicians who reflect the pure illumination of their own well-cultivated and disinterested minds upon the dark barbarism of the Danubian states. The Servians may have moved some steps up the ladder of civilization during the last twenty years. But what have they in common with the other states except a shadowy similarity of race? and with Moldavia and Wallachia they have not even that. No one, I should say, who had spent a single night in Bucharest, or sojourned in the religious houses of Moldavia, or seen glimpses of the home-life of the Bulgarian peasant, could look with much confidence for any good coming out of such communities. The Hungarians are on a totally different footing. They are a fine soldierlike race, with the instincts of government and high administration implanted in them and developing through generations. In point of civilization, they stand as high as any European nation—as high as any nation in the world. But they are but a handful—seven millions at the outside. They are alien in race from both the Serb, Slavonic, and Roumanian tribes, and they are hated by all neighboring nations. It is just possible to imagine them forming the propelling power and guiding intelligence of a great Danubian confederation, which might ultimately fix upon Constantinople as its capital; and there could perhaps be no solution of the Eastern Question more generally satisfactory. But the satisfaction could not be universal, even if the contingency were more imminent. Germany and France and England might approve, but would the House of Hapsburg welcome this divergence from hereditary policy? Or would the Emperor of Russia bring himself to forego the gratification of gathering the ripened pear, or indefinitely postpone it when, after long waiting, it seems so nearly ready to fall into his mouth?

And what do they say in England to all these plots and projects and solutions? Official personages are silent, but they bear the manner of

people who are impressed with the gravity of the situation. The unofficial, though not uninfluential, personages whom I have heard discoursing on the subject, and the better class of journalists, are, it must be admitted, groping in the dark and looking anxiously for light. But on three not immaterial points they seem decided: (1) that they are prepared to abandon the old national policy of maintaining Turkey *in statu quo;* (2) that they are determined to keep firm hold upon the communication between the Mediterranean and the Indian Empire; and (3) that they are prepared, if necessary, to fight to the last man for this communication. The Crimean War was fought to save the Turk and give him another chance. In one sense that war was useless, for it merely enabled the Turk to linger on in his extremity for twenty years. But in another sense it was worth the cost of it in men and money which it entailed. By throwing Russia back upon itself, it broke the spell of absolutism under which Central Europe had been lying prostrate for nearly half a century, and rendered impossible the extension of the principle. It facilitated the emancipation first and afterwards the unity of Italy. It procured the liberty and the restoration of their rights for the Hungarians; and it indirectly aided the overthrow of despotism in France. These were results worth fighting for, even if they were remote and unforeseen at first. And with them still fresh upon us, we can afford to abandon a policy that has been productive of so much good. It is no longer essential to our comfort to maintain the tottering Turkish Empire, and that Empire has failed to profit by the respite we procured. But the security of the route to India is of vital interest to the well-being, almost to the existence, of our power. Every year this has been more and more distinctly impressed upon the British mind, and this year, since the visit of the Prince of Wales to India, which has been sedulously watched by the whole reading public, this necessity has worked itself into the British popular imagination, which nowadays will always play an important if not always a wise part in British politics. The country, I believe, has for once made up its mind, cost what it will, that if Constantinople passes out of Turkish hands, Egypt must be upheld by British force.

## SARDOU'S NEW PLAY.

PARIS, November 19, 1875.

THE theatre plays an important part in Parisian life; there are many people in Paris who never go into society, and who spend almost all their evenings at the play. It must be said, before all, that we have now the most admirable school of actors. I do not speak of the actors and actresses alone who have made their names famous not only in France but in Belgium, in England, in Russia, wherever there is a French stage. There is a school of actors, an innumerable number of men and women, who can act with a *naturel*, a good grace, an absence of bombastic extravagance, of pretension, of awkwardness, which is truly wonderful. This is the time of year when new pieces are produced on the stage: society has not yet opened its salons, the gentlemen have a little freedom, and they can give their verdict on the new dramas. Such a verdict is, of course, only necessary for pieces which have a literary character and a social object; operas and small operettas have their own public, which is quite different from the public that is able to pass judgment on a comedy or a tragedy.

Among our dramatic writers who still try to give some satisfaction to literary judges and are not quite contented with the public which the railways bring every day to Paris from the provinces and from the whole world, is M. Sardou. His name is probably not very popular in America, as he wrote that bad piece called "Oncle Sam"; his excuse lies in the fact that he had never crossed the Atlantic, and that he believed in the wild stories told by an extravagant writer called M. Assollant. Sardou writes too much, and does not take sufficient time for the choice of his materials; he belongs to the feverish school of over-production. He was determined to build up a large fortune, and wanted to show that he could do as much with his brains as the bears or bulls of the Exchange can do often without any brains at all. He was so poor in his youth that, on leaving college, he was obliged to re-enter it in the humble and despised capacity of what the French call a *pion*. The *pion* is a university serjeant, the man whom you see walking by the collegians; he sleeps in their dormitory, eats at their table, and generally acts like the shepherd or rather like the shepherd's dog about the flock. Now, Sardou owns a fine country-house, a part of the royal park of Marly. He adorns his house with the finest tapestries of the "grand siècle"; he is rich and prosperous. But he has remained an artist; he works like a slave; he is extremely eager for all possible information, for all details concerning the history of mankind. One of his last pieces, the "Merveilleuses," was a complete failure; the plot was too insignificant, but the costumes, the characters, were all drawn out of a magnificent collection made at a great expense. Sardou's friends told him, on this occasion, that the public cared less about a perfect *couleur locale* than he did himself; it did not matter if the costumes of the Directory were more or less faithful; the public wanted real passions, not clothes. Sardou is not obstinate; he changes his manner, not in the course of a few years, like the great painters—he can change it three times a year. He rather likes to change it, to jump from one thing to another, to alter his system; he is a sort of dramatic clown. Who would think that the same man wrote "Les Pattes de Mouche," a piece which might have been signed by Scribe, and "Patrie," a dark and awful drama, full of terrors and crimes? "Patrie" will probably always be the greatest work of Sardou. There was much artistic beauty in a piece of the same calibre called "La Haine," but there was too much horror in it for the Parisian palate. "La Haine" was inspired by the history of the Italian Republics of the Middle Ages, as "Patrie" was inspired by Motley's history of the Netherlands. Sardou is always looking for an inspiration, on all sides, in every direction; he has no system, he will not restrict himself to any particular set of ideas.

Yesterday he brought a new piece on the stage at the Gymnase, called "Ferréol." I had not for some time seen a first representation—what the Parisians call "une première": a word which must be pronounced with a certain emotion. To be at a "première" is the dream of many a young man, of many a lady. For many, it often remains always a dream. No tickets are sold at the office of the theatre on the mysterious day of the birth of a new piece; the author gives away a large number of tickets to his friends and admirers. What the director does with the rest is known, as far as the press is concerned: every important newspaper and review receives places for its critics. The director must also give tickets to those authors who have their *entrées* in all the theatres, and who are considered as the natural lords of the literary field. How he disposes of the remaining tickets is a deep mystery. What is known about it is simply this: there are seats to be had, not at the regular office of the theatre, but at some irregular offices—sometimes at wine-shops, bars, etc. These are sold at extravagant prices, and the result of it is that in the audience of a "première" you see always two elements of the population of Paris—the literary element, which with its various representatives fills half the room, and the element which I hardly know how to characterize—rich financiers, rich foreigners, dissolute men of the clubs, actresses, and ladies of the "demi-monde" in their finest clothes and with all their artillery of diamonds and jewels.

I have it from several authors that this odd public is extremely formidable in their eyes. From the literary element they fear jealousy, coldness, a great disposition to see the defects of every work, fastidiousness; from the other element—the vapid and corrupt element—they fear indifference. They can only act on the nervous system of such a public by finding very strong, very new, very original situations. This public of the "premières" is sometimes very cold at moments when the author expected to make his greatest effect; and sometimes a few very simple words, a soft intonation, some "cri de l'âme," some exhibition of youth and innocence, will send a thrill of genuine emotion among these tired, worn-out literary hacks and anxious Aspasias. The author never appears on such evenings; he is in the *coulisses* giving a last word of advice to one or another. The actors are uneasy; they are always more or less excited when they have to appear in a new character before the public, who will pronounce if their part is a "success" or a "failure." In his new piece it was quite clear at once that Sardou had taken his inspiration from Gaboriau. You must know Gaboriau even in America. He died two years ago, worn out with work. He had invented a kind of sensational novel, founded on the difficulties in detecting the authors of certain crimes. Justice was always on the wrong track; all the evidence went against one man, while another man was guilty. The agony of the innocent was kept up in one, two, or three volumes. So it was yesterday in five acts, only Sardou has not taken the simple Gaboriau system: he has improved it; he has added to it the dramatic element, the struggle of contending passions. The truth could be made known at any moment in his drama if one man spoke; but he could not speak without destroying the reputation of a woman. Here you have a real drama: which ought you to prefer, the honor of a woman you love, or the life of a friend? If you speak, the woman is lost; if you do not speak, the man. Out of this situation Sardou has drawn very dramatic scenes; but this is only one of the aspects of the new drama. There is another conflict or duel of passions in the heart of a judge. He must choose between the honor of his own wife and the accomplishment of his duty. He does not hesitate,

and the scenes in which the stern magistrate has to overcome the feelings of the fond husband are the most impressive of all. I don't think that a drama can well be analyzed, so I will not even give you the names of the various *dramatis personæ*. I simply wished to show that Sardou has understood that the play of contending passions was a necessary element of dramatic art. He is a wonderful master in the arrangement of the various scenes, in the development of the plot: the greatest effect is sometimes produced by one single word, by the most natural and trifling incident.

"Ferréol" met with an enthusiastic reception. It is very curious to see how sensitive, after all, the most *blasés* Parisians still remain; how, once moved and thrown out of themselves, they seem to enjoy the pleasure of new sensations. The enthusiasm of the audience was divided between Sardou and a young actor named Worms, who has just arrived from St. Petersburg, where he has been living several years. I recognized at once in him a tragedian, a man who is not born to remain in the vulgar world of the *comédie bourgeoise;* he is calm and dignified; he ought to appear as a young Roman or as Achilles. His place is marked at the Théâtre Français next to that young tragedienne called Sarah Bernhardt, who has inherited some of the magnificent qualities of Rachel—an innate nobility in every motion, a voice which has something superhuman in its harmony and its authority. It is certainly a remarkable fact that the Jewish race should have such extraordinary aptitude for the stage. Sarah Bernhardt is a Jewess, as her name well shows; this future tragedian, Worms, has an unmistakable Jewish name. There is in some representatives of that race the accumulated nobility of centuries. The nobility of Rachel was not learnt; she began life playing on the guitar in public gardens. Sarah Bernhardt was, I believe, born in a porter's lodge; she had at any rate the most humble beginnings. She is now by far the most remarkable actress in Paris, the only one, in fact, who has in her something which approaches genius. Unfortunately, her health is miserable and she seems a living skeleton, and without the artificial red she would be "jam pallida morte futurâ."

The French are very fond of making pleasantries on the old tragedy; and it must be admitted that there is an insufferable dulness in a bad tragedy in five acts, and that human patience can hardly endure the bad tragedy when it is played by inferior actors. But the Parisians run to the tragedy as soon as they perceive in it an element of dramatic beauty. They don't understand the Italian language, but they are now flocking in great numbers to see the Italian tragedian, Rossi; he has met with more success here than he ever did at Rome or at Florence. Rossi has played here *King Lear* and *Hamlet;* he certainly has fine qualities; but shall I ever forget your great actor, Booth, in *Hamlet?* He alone gave me the ideal *Hamlet* I had always dreamt of, and he even added much to the fancies of my imagination. The part of *Hamlet*, so full of imagination, is hardly fit for an actor of Latin origin. The force of race is shown in everything. Rachel was never so fine as in the religious drama, in "Athalie" and in "Polyeucte"; she belonged to a religious race, the noble race which asserted the rights of monotheism in the midst of a materialistic civilization which had deified the passions of mankind. Poor Rachel! when she said "je suis chrétienne" in "Polyeucte," it was not the Jewess who spoke; it was the representative of the oldest and noblest family of mankind. She was of course more admired, and in some respects she was more admirable, in some of the Greek and Roman dramas, in "Phèdre" and "Andromaque"; but to me she always had a wonderful charm in "Athalie," even in "Esther." She was a Jewish queen, and felt happy in that character.

Among all the troubles of the world, it is a pleasure at times to be thrown completely into the imaginative world of the drama; and the tragedy has this advantage, that it drags you further from the vulgarities of life; you forget yourself better in the company of saints and heroes than in the society of even the Tartufes and the Misanthropes. This is probably the reason why humanity feels at times refreshed by tragedy, and why the drama which merely represents the horrible incidents of everyday life, and seems made up of the reports of the police court and the courts of assize, can after all have but a transient success. We would, therefore, if we had any influence with M. Sardou, beg him to abandon such subjects as his applauded "Ferréol"; to return to the higher and nobler sphere of "Patrie" and "La Haine." Everyday life is only too dramatic and too distressing; don't show it to us in its most odious aspects. Take us rather away from it, and show us the play of human passions under other skies than ours, other costumes than our daily costumes, other faces than the faces which do not speak to our imagination, to our instinctive love for what is great and old and immortal.

# Correspondence.

## GOV. FLETCHER'S CORRESPONDENCE WITH THE "GLOBE-DEMOCRAT."

To the Editor of The Nation:

Sir: In your paper of the 11th Nov. there appears the following statement:

"The *Tribune* made a statement that Thomas C. Fletcher, chairman [of the Red Cloud Commission], occupied a good deal of his time while the investigation was going on in writing letters, under an assumed name, to a Western paper, defending Delano from the charges against him, or, in other words, whitewashing the Interior Department and the Indian administration, and generally taking the part of counsel for the defence. . . . We find on investigation that the charge is perfectly true, and cannot be denied."

I did not see the article in the *Tribune* to which you refer, and would not have seen the above in the *Nation* if a friend had not brought it to me this evening. You say you "have investigated the charge, and find it perfectly true." Now, you will please produce the letters written by me justifying the charge. Failing to do this, I shall demand the judgment of every decent and fair-minded man in the United States against your paper, for the endorsement and propagation of a very mean and malicious slander.

I assert that I never wrote a word of or concerning Mr. Delano, or of the charges against him or the Interior Department, or in his defence, or in defence of the Interior Department or of the Indian administration, in all my life, except as is written in our report; and I defy you to produce the letters contradicting this statement.—Respectfully,

Tho. C. Fletcher.

St. Louis, Nov. 26, 1875.

[The correspondence to which we referred consisted of a series of letters published in the *Globe-Democrat* while the investigation was going on last summer, and signed "Piute Chief." These letters were in substance an attack on the promoter of the investigation, Prof. Marsh, under cover of a gross travesty of the evidence against the Indian administration, and puffs of the chairman of the Commission. Though ostensibly written for the purpose of describing the proceedings of the Commission, they were so constructed as to have no meaning except as a defence of Smith and Delano. They therefore were essentially what we said they were in the *Nation*. We publish Mr. Fletcher's letter, not because there is any foundation for his defence, but in order to give him an opportunity to deny, if he chooses to do so, the authorship of the Piute letters. When he does this, we will produce our proofs.—Ed. Nation.]

# Notes.

A. S. BARNES & CO. will publish early next year 'Memoirs of the Rev. Charles J. Finney,' written by himself, and a 'Centennial History.' The *International Review* for January will contain an article on the Herzegovinian Question, "by a high authority."—D. Appleton & Co. have published in one volume 8vo. pp. 978, 'A Text-book on Human Physiology,' designed for the use of practitioners and students of medicine. It is a condensation by Dr. Austin Flint, jr., of his *opus magnum* in five volumes on the 'Physiology of Man,' and as such cannot but prove most valuable and convenient to those for whom it is intended. Quite naturally there reaches us at the same time the sixth edition of Dr. J. C. Dalton's standard 'Treatise on Human Physiology,' revised and enlarged (Philadelphia: Henry C. Lea). The merits of both these works have been fully discussed in the *Nation*.——The first of the 'Memoirs of the American Association for the Advancement of Science' is on "Fossil Butterflies," by Samuel H. Scudder (Salem, Mass.) This field of study is, as is well known, a restricted one, and Mr. Scudder's monograph is at once exhaustive and authoritative. The funds to publish the work consisted of the gift of a thousand dollars made to the Association by Miss Elizabeth Thompson of this city. The result is a handsomely-printed volume, containing three steel plates, which—the edition being 1,000 copies—has actually been produced at the cost of one dollar. Such judicious management, both in the selection and in the manufacture of the 'Memoir,' ought to stimulate other like gifts, seeing that the Association is wholly dependent on aid of this kind in continuing the series.——Apropos of the letter from our Paris

correspondent on another page, we may mention that the Librarie des Bibliophiles announces 'Comédiens et Comédiennes,'a series of critical essays upon the leading actors and actresses of Paris, by M. Francisque Sarcey, the celebrated theatrical critic of the *Temps*. The work will be published in parts, illustrated with etchings by M. Léon Gaucherel. This work will do for the French stage of to-day what MM. Hillemacher and De Manne in their two volumes, called the 'Troupe de Voltaire' and the 'Troupe de Talma' and published a few years ago by Scheuring of Lyons, did for the stage of the last century and the first third of this.——*O Novo Mundo* states (Nov. 23) that the Brazilian Minister to Austria, F. A. de Varnhagen, is passing through the press at Vienna a work on the origin of the South-American Tupis, as deduced from comparative philology ('L'Origine des Américains Tupis,' etc.) The distinguished historian holds that this Brazilian folk migrated across the Atlantic more than a thousand years ago. To substantiate his view that the Tupi language is not polysynthetic, he has undertaken to reprint at the same time the dictionaries of Montoya, of which the two volumes of the first edition (1639–40) cost him about five hundred dollars.

—Readers and friends of the *American Naturalist*, whom the attenuation of the last few numbers has filled with painful forebodings, will be glad to learn that H. O. Houghton & Co. are to become the publishers of this useful periodical, beginning with the January number. The same house has purchased of J. B. Ford & Co. the important 'American Mechanical Dictionary' of Mr. Edward H. Knight, of the United States Patent Office, of which two volumes have already appeared (A–Pan), and 700 pages out of about 1,050 of the third volume are now in type, with a prospect of speedy completion. The embarrassments of its former publishers have therefore not affected this undertaking, the magnitude of which may be judged from the fact that it embraces some 20,000 subjects, and is illustrated by upwards of 5,000 engravings, mostly incorporated with the text, but many full-page, like that facing page 2,129, which shows 68 varieties of sewing-machine stitches. Mr. Knight, by the way, remarks that "if required to name the three subjects of invention on which the most extraordinary versatility of invention has been expended, the answer should be without hesitation : the sewing-machine, reaping-machine, and breech-loading firearm. Each of these has thousands of patents, and while each of them is the growth of the last forty years, it is only during the last twenty-five years that they have filled any notable place in the world." In confirmation of this, one has only to look at the classified list of sewing-machines and attachments patented in this country from Feb. 21, 1842, to March 9, 1875, which occupies ten and a half closely printed pages of the 'Dictionary' in triple column. One or two features of this work are new and of great practical utility. Such is the general alphabetical technical index of materials, appliances, etc. appertaining say to a process like photography, or a manufacture like paper, or implements like axes, hammers, forks, etc., etc. There are no less than one hundred and fifty such indexes scattered through the three volumes. Another convenience for a defective memory is lists of -graphs, -meters, and -types, which show at a glance all the instruments whose names thus terminate. Each name may then be referred to in its proper place in the 'Dictionary.'

—Prof. Ch. Fred. Hartt has published, at Rio de Janeiro, a pamphlet of 'Notes on the Manufacture of Pottery among Savage Races.' It is a very valuable compendium of the records of primitive pottery-making, and it justifies the author in holding that this manufacture, "being intimately connected with the labors of the kitchen, belongs, the world over, among savage tribes of a certain state of culture, to woman" :

"When, however, in the progress of the tribe in culture, the practice of the art of pottery comes to be a profession, and to interfere with household work, it passes naturally into the hands of man ; and it will be found that, in every case where men make earthenware, the tribe has advanced considerably beyond the savage state. But savage woman not only fabricates vessels of clay, she also ornaments them ; and if the fictile art has originated with her, and has grown up under her hands, it seems no less probable that the ornaments she uses should have originated with her ; and the probability is increased by the fact that to her falls the work of spinning and weaving, of making and decorating personal ornaments and clothes, and of making baskets, mats, etc. She is everywhere the primitive decorative artist."

The account of the way the common pot is made up—of a long coil of clay—will be novel to most readers. It directly reveals the origin of ornaments which consist of "strips of clay laid on in spirals and other figures." "The 'apple-pie' border, made by impressing with the extremity of the finger, or by pinching up a line of elevations between the thumb and forefinger, was also in common use among the same Indians [the Bluff-Dwellers], and is still perpetuated on the modern pottery of the Amazonas. In the use of this and other ornaments by women to-day in the making of pastry, it is curious to observe her perpetuating forms that originated in ceramic art." We commend Prof. Hartt's 'Notes' to the *Woman's Journal* for its column of selections.

—The quality of the sympathy or admiration for the late Edgar A. Poe, which has just expended itself upon a monument in Baltimore, could have been, perhaps, more fitly shown by providing suitable food, clothing, and a home for his only sister, Rosalie, who has just died in a charity house, to which she had been admitted only a few months. She was for many years a cripple and a pauper. She procured the barest needs of life by the sale of her brother's photograph and by copying some of his short stories with her own hand. Her last request was that she might be buried by his side.

—Mr. Stanley's letter (date of April 12), printed in the *Herald* of Nov. 29, is the one entrusted to Col. Bellefonds, who was, unhappily, killed by the natives on his return to Col. Gordon. It is in the main only an amplification of his former letters, and leaves undescribed, because as yet unvisited, the southwestern shores of Lake Nyanza. The importance of the southeastern feeder, the Shimiyu, which is 370 miles long and is a mile in width at its mouth, is more clearly brought out ; indeed, should the Albert Nyanza be found to have no tributary of equal importance on the south, the Shimiyu is likely to exchange its name for that of the Nile itself. Mr. Stanley met with a great reception from King Mtesa, whom he found a very attractive character, intelligent enough to have become a recent convert to Mohammedanism and to have adopted the Arab dress and, together with his court, to affect Arab customs. The explorer entertains high hopes of this chief's future beneficent influence over equatorial Africa, and regards his capital as a most promising seat of missionary labor of a sort which with religious training should unite instruction in the arts of civilization. "It is the practical Christian tutor, who can teach people how to become Christians, cure their diseases, construct their dwellings, understands agriculture, and can turn his hand to anything, like a sailor—this is the man that is wanted here." Stanley's course is to be across country to the Albert Nyanza. Some critical but friendly remarks on his topographical discoveries on the Victoria, by Capt. Burton, will be found in the *Geographical Magazine* for November.

—We are permitted to make the following extracts from a private letter written by an American major of engineers in the Khedive's service, dated El Obeid, Kordofan, Sept. 23, 1875 :

"By this time I have seen a good deal of Kordofan, and I have formed my plan as to the proper thing to do with it. One should enslave all the inhabitants and take them to the only part of Africa worth bothering about —the banks of the Lower Nile ; and Kordofan should be left as pasture-ground for ostriches and lions. And yet Kordofan is one of the best parts of Africa. . . . Shortly after we got here I received orders limiting the operations of the expedition to Kordofan. . . . We have been tranquilly laid up here the past three months, waiting for the rainy season to come and go. It has come and gone. . . . It is time. For the last month we have been a pretty forlorn party. Everybody has been sick—officers, soldiers, and servants. . . . The black soldiers in garrison here have died by ten to fifteen a day, and four companies of Egyptian troops (total 300 to 400 men) which stopped here *en route* for Dar-For lost forty men in three weeks. My soldiers have been well housed and well fed, and to that I attribute their comparative immunity. The sickness is a low fever of intermittent form, often with a typhoid type, perhaps something like what army surgeons in America know as typho-malarial fever. No one escapes but the natives. . . .

"In spite of the rain, I have contrived to get a little work done. I have sent out several short expeditions, and the exploration of Kordofan north of the parallel of Obeid is nearly completed. A less interesting country would be difficult to find. El Obeid, the capital, is in lat. 13° 10′ N. The inhabited and habitable part of Kordofan extends north of this from one to two degrees, and is limited on the east by the Nile, and on the west by a desert which begins some fifty miles from here, and separates Kordofan from Dar-For. South, I know nothing. The northern and western deserts, or more properly steppes, are roamed over by nomadic tribes of camel-breeders and robbers, who pay tribute to the province of Kordofan, but are hardly governed by it. The portion which I have mentioned as habitable is a rolling upland of very uniform altitude, 1,800 to 2,000 feet above the sea, marked by few 'accidents of terrain,' and watered only by the rains which fall in June, July, August, and September. There is not a water-course in the whole land other than a gully made by a summer shower, and I am sure no drop of water from this country ever finds its way to the Nile. It is at once absorbed by the dry soil. . . . You can hardly get out of sight of villages, but you can very easily get out of the way of water. It is not at all uncommon for the people to bring water from wells ten miles away. During the rainy season they ordinarily procure water from a reservoir near at hand. These reservoirs are utilized in all ways, for in Africa water is not wasted, and if you are forced to travel in this land it is better not to see the reservoir. . . . Praise God ! I have developed a great faculty for not seeing things, and if I could lose the sense of smell I should be almost happy. . . .

"Of course little is to be done with a waterless land. The only crop

raised in the whole of Kordofan is 'dokhu,' a sort of millet, I believe. This grain furnishes bread and beer for the people, and on bread and beer they live. At times you find herds of cattle, and oftener goats, and rarely chickens. The *dokhu* grows during the rainy season. It is put in the ground, heaven ripens it, the slaves gather and grind it, and during eight months of the year the sole occupation of the land is to eat and drink it. As I have said, I have had out parties more or less of the time since I have been here, but all accurate work I must do myself. The Arab staff officers are of wonderfully little account; they are not only ignorant and lazy, but they are what the Western editor called fountains of mendacity—rivers, floods, lakes of mendacity. Still, I hope to get up a map of the country which in accuracy and detail will 'scoop blind' all previous maps of African exploration. Modest hope! I am terribly harassed by the cabinet geographer of Cairo, who wants maps, and maps, and more maps, and d—n the accuracy. I am determined, however, to consider a little my own reputation."

—The autumnal exhibition of the Brooklyn Art Association was opened on the 29th ultimo with a large collection of paintings and drawings, some of considerable interest. Figure-painting has hardly reached a higher degree of excellence among American artists for a general balance of good qualities than in the contributions of Mr. F. A. Bridgman, "The Nubian Story-Teller" (1), and the "Kabyle Woman" (153). The first, recently shown in a Paris salon, gives a beautifully-arranged group of Eastern houris, contrasted with forms of picturesque ugliness in the persons of the improvisatrice and the African slave-girl. It is true that some of the odalisques fall into attitudes rather Parisian than Eastern; but for craftsmanlike grouping and lighting we do not know that a better picture of the kind has ever been produced by an American. The second is of life-size, and finely modelled. In landscape the honors are borne away by the large coast-scene, "Drifting Ashore in the Fog," from the easel of M. F. De Haas. Either of these important pictures would do honor to any school of painting. The only quality we would demur to is the preoccupation of the respective artists with other men's styles—a preoccupation so marked that it is evident Mr. Bridgman was thinking quite as much of Boulanger and Gérôme as of the models when he designed his groups, and that Mr. De Haas could not get Achenbach out of his head when sketching his sea-coast, even as Mr. Bricher, in another marine subject, obviously loves Mr. Richards as devotedly as he loves nature. Individuality of impression is still quite as much a desideratum among our better class of painters as it is among our better poets and essayists. Noticeable pictures on various accounts were the Oriental sketches, direct from life, of the explorer, Mr. A. L. Rawson, Mr. Blashfield's "Lady Reading" (26), Mr. McEntee's delicious "Sea from Shore" (330), Mr. E. Johnson's "Naughty Boy" (379), Mr. Guy's "Ignorance is Bliss" (375), Mr. S. Colman's sketches (352 to 355), Mr. Charles H. Miller's "High Bridge" (298), with its admirable sky, Mr. Parton's "Scotch Twilight" (266), and Mr. G. H. Boughton's "Girl I left behind me" (327). The drawings by youths of the Polytechnic and young ladies of the Packer Institutes gave an interesting educational tone to an exhibition which, though still in an inchoate state, begins to show more independence and less reliance on imported shop-window art than in former years.

—The *Portfolio* (J. W. Bouton) produces for November certainly a tame number, though the etching by Chattock of a Constable subject is at least as good as have been most of the landscapes by the French aquafortists on whom Mr. Hamerton usually depends for that kind of reproduction. We find nothing to condemn and little to signalize among the articles by Messrs. Hamerton, Wornum, Ménard, Atkinson, and Chattock, but can profess only a limited admiration for M. Gaucherel's group of trees in the first illustration, and M. Veyrassat's innocuous "Watering-place," facing page 164.—Mr. R E. Moore sends us a really artistic line-engraving of one of Mr. Eastman Johnson's most poetically-conceived pictures—that of a lady who coaxes a lamb to eat out of her hand by a process of crouching and crawling across a pasture in a way that only a very pretty woman could practise with impunity to her graces. The sense of a tantalizing slowness of motion is perfectly expressed in the long, horizontal train of the woman's dress and the drag of the animal's soft limbs and body. The style of engraving is rather dainty than powerful, and the lady's face is puffy, with but a poor understanding of the foreshortened planes of its modelling; but the plants, grass, and distance are admirable.

—As it seems to be generally admitted that we have not seen the end of the contest over the currency, it may perhaps be well to remind the advocates of "soft money" that it is by no means a modern invention or the offspring of Christian civilization, but that it was already known in remote antiquity. The great lawgiver, Lycurgus, "legalized" leather money in Sparta; but his object in doing so was the very reverse of that which Messrs. Kelley and Butler and other inflationists aim to effect by paper-money. Machiavelli, in his 'Discourses on the first Ten Books of Livy,' Book II., Chap. 3, in explaining the great difference in the relative growth of the Roman and Spartan Republics, relates that

"Lycurgus, the founder of the Spartan Republic, believing that nothing could more readily destroy his laws than the admixture of new inhabitants, did everything possible to deter strangers from flocking thither. Besides denying them intermarriage, citizenship, and all other companionships (*conversationi*) that bring men together, *he ordered that in his Republic only leather money should be used, so as to indispose all strangers to bring merchandise into Sparta or to exercise any kind of art or industry there, so that the city never could increase in population.*"

It seems impossible to have more clearly and sagaciously foreseen the real effect of "soft money"; and certainly we have proof of the correctness of the judgment of the great lawgiver of antiquity in the recent immense falling-off of immigration into the United States and in the diminution of commerce.

—By a temporary residence upon British soil at the time of publication in England, it is already possible for an American to secure an English copyright. Advantage of this is frequently taken, and it is now no unusual thing to see the words "copyright edition" appended to the English publisher's advertisements of an American book. To step across the border is no great hardship for those who live near the Canada line, although it is for the dwellers in Florida, Texas, and New Mexico. Perhaps a strict construction of the new Canadian Copyright Act of 1875 may hereafter destroy this facility. By a recent discovery, however, a new mode of obtaining literary protection in England is made possible. With logical liberality, France has not confined the protective benefits of its legislation solely to natives—they are also extended to aliens. The decree of February 5, 1810 (quoted p. 750, vol. ii. of Mr. James Appleton Morgan's 'Law of Literature'), protects 'les auteurs, soit nationaux, soit étrangers." Therefore any American can secure protection in France by complying with the provisions of its copyright enactments. By the terms of the international copyright treaty between France and England (15 and 16 Vic., c. xii.) the holder of a copyright in France may secure copyright in England by fulfilling certain specified conditions. There seems, therefore, to be nothing to prevent the American author from entering his work in France—by proxy, if more convenient—and then, on the strength of his French copyright, applying for registration at Stationers' Hall.

—All the readers of the *Philologus* know that one marked feature of that journal has been the publication from time to time of some article by a competent hand summing up the results of recent research in different directions. What the *Philologus* has done sporadically, the *Jahresbericht über die Fortschritte der Alterthumswissenschaft*, published by Calvary of Berlin and edited by Conrad Bursian of Munich, has undertaken to do systematically, and the first volume, covering the year 1873, is nearly finished. We understand that it is the intention of the publisher to bring out the review of 1874 and 1875 together, so as to keep the reader still more closely up to the time. Highly acceptable to all classical scholars, no matter what their resources, the *Jahresbericht* is simply indispensable to those who have not access to all the numerous philological journals of Germany. Among the contributors, Bursian himself, Ribbeck, Bergk, Friedländer, Lange, W. Wagner, Wecklein, Blass, and Susemihl, are household words to any man who has the least acquaintance with the philology of the day, and, to take no higher view, the American philologian may almost save the price of the *Jahresbericht* by heeding the warnings of some of the distinguished critics. Buying German books by the title is far from a safe investment.

—In No. 490 of the *Nation* we noticed Scheffer-Boichorst's 'Florentiner Studien,' in which the author, after conclusively proving the unauthenticity of Malespini's chronicle, attempted to show that one of the next oldest historians, the celebrated Dino Compagni, was equally untrustworthy, and that his history was a forgery of the sixteenth century. We expressed at the time our regret that Dino Compagni should disappear from the list of Italian historians, and hoped that the doubts cast upon him would be removed by a critical text and examination of his sources. The article by Scheffer-Boichorst aroused great interest both in Italy and Germany, and has called forth several works which may be of interest to historical students in this country. As long ago as 1857, Pietro Fanfani, one of the most celebrated of Italian scholars, attacked the authenticity of Compagni from a philological standpoint, and has lately resigned his membership of the Academia della Crusca in order to engage more freely in the discussion. He has brought together his various articles on the subject and printed them under the title: 'Dino Compagni vendicato dalla Calunnia di Scrittore della Cronaca' (Milan, 1875). His arguments are chiefly based upon the language of the chronicle, and his deductions are not complimen-

tary to the great body of Italian philologists, who have always considered Compagni a model *trecentista*. Fanfani has found a number of followers among his countrymen, one of whom hastens to demolish Compagni with the patriotic desire "that the Father of Italian history shall at least find a grave in his own land." On the other hand, a number of equally celebrated scholars in Italy have undertaken Compagni's defence, among them Capponi (see No. 524 of the *Nation*), in his 'Storia di Firenze,' and Paolo Tedeschi in the *Rivista Europea* (May to July, 1875). It is to be observed that all of Compagni's defenders acknowledge a great confusion in his historical details and unaccountable slips in his language. Capponi suggests ('Storia di Firenze,' I, p. 98, note) that his history may have been put together by some other hand from imperfect material (*sopra una copia informe*). This hint is the key-note to the latest defence of Compagni, this time quite appropriately by a German: 'Die Chronik des Dino Compagni: Versuch einer Rettung von Dr. C. Hegel' (Leipzig, 1875). We shall wait with interest for the critical edition of the chronicle now being prepared in Florence by Prof. Del Lungo, whom the Italian Government, feeling that the national honor is concerned, is liberally assisting with manuscripts, etc., from the public libraries.

—One effect of this discussion in Germany has been to direct attention to the early history of Florence, which has been so strangely neglected by native scholars, and even by Capponi. Dr. Otto Hartwig, well known by a work on Sicily, has just published 'Quellen und Forschungen zur ältesten Geschichte der Stadt Florenz' (Marburg, 1875). The oldest chronicler whose name is known is Sanzanome, whose work, cited as the 'Gesta Florentinorum,' breaks off in 1231. This chronicle, interesting as containing events of which the author was an eye-witness, is published for the first time by Hartwig, and, although a fragment, is of great importance from a literary-historical point of view. Another heretofore inedited work, also here published for the first time, is the so-called 'Chronica de Origine Civitatis,' which contains the stories of Rome, Fiesole, and the Trojans, alluded to by Dante in Par. xv. 124, and which Villani and Malespini incorporated into their works. Dr. Hartwig gives, in three parallel columns, the Latin text, an Italian *rifacciamento* of the fourteenth century, from a MS. in Lucca, and a republication of the rare *Libro Fiesolano*. The student thus has before him the various shapes the material assumed until it was appropriated by Villani and Malespini. The third section of Hartwig's work consists of an essay on Florence to the beginning of the twelfth century. He traces the city back to its foundation by the Romans about 190 B.C. It was later refounded by Augustus, and named Julia Augusta Florentia (Hartwig derives the name from Flora, like Faventia, Fidentia, Valentia, etc.) The story of the destruction of the city by Totila (*alias* Attila) and its rebuilding by Charlemagne is shown to be legendary. The decided ecclesiastical tendency of the city appears at a very early date, as well as certain political characteristics which mark the later history of the city. Dr. Hartwig has nearly ready for the press a second part to his work, which will contain "extensive commentaries on early annals of Florence, some of which are still inedited, as full a list of the consuls and podestàs as possible, an examination of the so-called 'Chronicon Brunetto Latini,' and a reconstruction of the annalistic 'Gesta Florentinorum,' from which Villani and other chroniclers derive nearly all their knowledge of the history of Florence down to 1308."

## DIGBY ON THE HISTORY OF ENGLISH LAW.*

MR. DIGBY'S admirable book needs, as it deserves, the notice of appreciative reviewers. Its title, and we must add its appearance, do it injustice, and are likely to delay for a time its being read by persons who, when once they have looked into it, will fully appreciate its merit and interest. A little stumpy book, entitled the 'History of the Law of Real Property,' and got up in colors of that respectable dulness which seems to give notice that the contents may be useful to students but are certain to be interesting to none but the unhappy persons about to undergo examinations, is certain to be shunned by even the best specimens of the fastidious class known as intelligent readers. Yet any one to whom history is more than an idle pastime will, on inspecting Mr. Digby's work, find that it is a most important contribution to the investigation of that vast and unexplored province of research—the history of English law.

Mr. Digby deserves the credit of being the first person who, of recent years, and with the advantages of modern knowledge and modern canons of criticism, has attempted to explore, or rather to begin entering upon, what we venture to assert is the portion of the history, not so much of England as of the English race, which most needs research and will best repay the labors of an intelligent discoverer. English law is the most original creation of the English genius. It has influenced more deeply than any other power except that of religion the history and character of the race on both sides of the Atlantic. The law of England will, it is highly probable, be, like the law of Rome, the most permanent record both in East and West of the greatness of its creators. Yet no great historian, either in England or America, has made the legal institutions of which both countries have so much reason to be proud the subject of special study, and writers who, like Mr. Freeman, exult obtrusively in the blessing of being Englishmen and owing nothing to Roman civilization, show an almost studied neglect of the law which is the one intellectual creation that the English race can boast of as emphatically their own. From this censure Professor Stubbs must be markedly excepted. His works deal with the constitution rather than the law of England, but they contain as much information about legal institutions as can be brought within their scope. The admirable 'Select Charters' have obviously suggested to Mr. Digby his collection of authorities on the 'History of Real Property.' Such collections are of course not what is called light reading, but they have the great merit, when made by so competent a person as Mr. Digby, that everything they contain is worth having. An original authority constantly suggests far more than it directly states. Its worth depends upon the knowledge of the person studying it. To sheer ignorance it tells next to nothing, but exactly in proportion as a student's knowledge increases so the information increases also which original documents yield to his study. The great point is to be furnished with a guide, such as Mr. Digby or Professor Stubbs, who has knowledge enough to lead us to the most important documents, learning to explain difficulties, and intelligence enough to suggest right lines of thought.

Our quarrel with Mr. Digby is that an undue desire for compression, or a great underrating of his own powers and an overestimate of other people's knowledge, has led him to give far less than we could desire of his own comments and explanations. It is provoking that a man who can do the work so well, and has spared no labor to produce a thoroughly workmanlike article, should have been so sparing in his own remarks and elucidations. He should certainly have pity upon persons who, like ourselves, have sought in vain for friendly guidance through the intricacies of the pleadings in Taltarum's case, and, even when trying less slippery paths, have felt that the aid of a translation or note would be decidedly acceptable. A critic may pardonably dwell on deficiencies which an author can easily correct in a future edition, and we would earnestly suggest the expediency of uniformly translating all the Latin documents and of adding more copious notes and more diffuse comment. These improvements will double the use of the work to students, and enable readers who are not deficient in legal knowledge to perceive more easily than they can now do the many interesting trains of thought and speculation which his pages suggest.

Two aspects of Mr. Digby's work are to our mind specially worthy of attention. The first is what may be termed the purely historical aspect of early law. When you study the early laws either of the English or of any other people, as revealed in original documents, you are struck with the fact of the extreme formalism, so to speak, which characterizes an uncivilized society. Nothing, for instance, that the pleaders whose practice was satirized a century ago in the 'Pleader's Guide' invented or imagined, can have exceeded the subtle complexity of the pleadings in Taltarum's case. Here, indeed, it may be said that we have passed, if not into an era exactly of high civilization, at any rate long beyond what are generally called early states of society, and it is, we admit, probable that the lawyers of Edward the Fourth's age represented an era which combined to a certain extent the kind of formalism which characterizes an advanced stage of society with the somewhat different kind of formalism characteristic of what is erroneously enough called the simplicity of uncivilized life. Still, whatever the worth of the particular illustration, the fact is undoubted that simplicity is precisely the characteristic in which early law is deficient, and that this deficiency is in part, at any rate, due to the importance attributed to forms. Never was a more vigorous effort made to expand a rigid system, so as to meet the necessities of advancing civilization, than was attempted by the reformers who passed the enactment on which were grounded "actions on the case," and never was a great reform more thwarted by the conservative formalism of legal practitioners. The respect for written documents which characterized early lawyers is a sign of the same state of feeling. Educated men know in a general way that the maxims of Roman law were in some mode or other introduced at an early period into the common law of England. Readers of Mr. Digby's book, when they perceive under his guidance how completely the rules as to

* 'An Introduction to the History of the Law of Real Property, with Original Authorities. By Kenelm Edward Digby, M.A., of Lincoln's Inn, Barrister-at-Law.' New York: Macmillan & Co.

*seisin* were modelled on the Roman doctrines with reference to possession, will understand how Roman law was introduced by the writers of early text-books into the texture of that "common law" which, in the age of Blackstone, was supposed to owe nothing to any foreign influence. Nor can it escape notice that one of the marked peculiarities of English law already existed at a very early period. This peculiarity is the singula deference shown by English lawyers to decided cases, and certainly existed at least as early as Glanvill. "We constantly find in Bracton judicial decisions quoted as authorities for particular propositions; traces of the same practice are found in Glanvill." This practice has moulded the whole genius of English law. It has, we may suspect, through the influence of law, told on the intellectual habits of the English people. Here, however, we touch on an enquiry which a work such as Mr. Digby's perpetually suggests: Can it be that the existence for centuries of a regular and uniform body of law, itself the growth of the ideas prevailing from age to age among the English race, has not affected the tone of mind and modes of thought prevalent among the English people? The answer is that in every department of speculation, in politics, in theology, in ethics, and in historical criticism, English modes of thought and feeling have been profoundly affected by the habits and associations produced by the English law. To indicate the grounds which support this conclusion would be the work of an essay. It is, however, impossible in noticing Mr. Digby's work not to call attention to the kind of speculations and enquiries which the philosophic study of English law is certain to suggest and in part to answer.

A second feature of Mr. Digby's book may be described as the prominence given by it to the logical or analytical aspect of legal study. Mr. Digby writes as a disciple in jurisprudence of Mr. Austin—an author whose name can never be mentioned without the profoundest respect by all who value clearness of thought and logical precision of language. Mr. Digby not only has fully seized and mastered, but (what is far more difficult) has intellectually appropriated the system of logical arrangement sketched out by his teacher. He has further done good service in showing by thorough tables, accompanied with lucid explanations, how the divisions and distinctions suggested by Austin can be practically used as a guide through the labyrinth of English law. This labor, which must have been more considerable than readers who enjoy its results will easily understand, has conferred two benefits on students. It has provided a clue to a legal maze in which beginners often lose their way. It has further given a reality or definiteness to divisions and distinctions (such, for example, as the fundamental distinction between rights available against all the world and rights available against particular persons) which, to those who read Austin for the first time, may seem unreal. In no way can a beginner be so easily convinced that the distinction between rights *in rem* and rights *in personam* is no mere subtlety invented by the overacuteness of logicians, but a distinction corresponding to the very nature of things, as by being forced to perceive its application to a system of law which, at first sight, appears absolutely to ignore the ground of division on which the whole scheme of Austin is based.

But though Mr. Digby's use of sound logical conceptions for the explanation of difficulties in English law is always interesting to persons who are used to the analysis of legal conceptions, and conveys a good deal of practical instruction to scholars who are commencing the study of jurisprudence, we must confess that the weakest point of Mr. Digby's work is the attempt to combine, within a necessarily limited space, two different methods of treatment. You may deal with law either historically or analytically; you may, that is to say, either trace the growth of legal conceptions and institutions, or else analyze logically the nature of such conceptions and show their place in a logically-arranged plan. The logical and the analytical methods are, no doubt, ultimately the complement one of the other, but they start from different points and hardly admit of being simultaneously pursued. Mr. Digby has attempted at once to give an account of the growth of a portion of the English law, and to apply to the elucidation of the difficulties of English law the logical principles of Austin. In either task he would, we doubt not, have achieved complete success; attempting both, he has set himself a task in the performance of which absolute success is unattainable. Our objection is not that an historian of law ought to forget the principles of jurisprudence. We hold, on the contrary, with Mr. Digby, that they ought never to be absent from his mind. Our objection is that it is scarcely possible to treat law at the same moment from the position of an historian and from the position of an analytical jurist. Jurisprudence holds to legal history much the same position that political economy does to historical narrative. No writer can master all the problems of history unless he bears in mind the principles of political economy. He will not, for instance, appreciate all the causes of the social changes which marked the sixteenth century unless he bears in mind the economical results of the depreciation in values of the precious metals. But no judicious historian will attempt to combine the composition of a history with the statement of economical doctrines. It is one thing to write the history of land-tenure and another to expound the theory of rent.

We have stated plainly our one grave objection to Mr. Digby's method of exposition, but we admit that much may be urged in favor of his mode of treating his subject. That subject is at any rate, in a special sense, his own. His book is (though not in our judgment free from some defects) a most valuable introduction to the study of law. It is a treatise which no lawyer or student can safely neglect, and every one who feels an interest in one of the most remarkable portions of English history must hope that the work is but the first instalment of further labors in the magnificent field wherein Mr. Digby has been the first, so to speak, to break ground.

## RECENT NOVELS.*

IT is certainly far from lavish praise of Dr. Holland's 'Sevenoaks' to say that it is an improvement upon his preceding novel, 'Arthur Bonnicastle.' There is still a rather well-filled side of Parnassus beyond this author's last and highest flight along the plain which he has yet to climb before he escapes the attention of his critics. Part of the comparative superiority of 'Sevenoaks' may be said to consist in its freedom from the offensive thrusting of a moral lesson upon the reader which more or less plainly marked its predecessor. In this novel the moral is not wanting, to be sure, but the reader is left to draw it for himself, and even the dullest will be able to do this without difficulty. In telling his story, Dr. Holland's instrument is not so much the lyre as the melodeon, as he proceeds to narrate the infamous life of just such a rich manufacturer, speculator, and "railway king" as is known to readers of the newspapers of the period. He has had plenty of models to his hand, and in certain of the incidents of the novel one recognizes familiar anecdotes concerning the misdeeds of this or that notorious man which have already appeared in print as bits of news or of scandal, so that the conjecture soon forms itself that Dr. Holland keeps a scrap-book in which he pastes anecdotes to be exhumed and put together to illustrate the character of his heroes. However this may be, Robert Belcher, the evil hero of this tale, is not a mere patchwork of different facts, and so far as he goes is a tolerably well-drawn character, but he gives this impression much more by what he does than by anything the author says of him. Dr. Holland, with great modesty, does not seem to trust to his literal transcriptions of real events, and goes to the pains of telling his readers that Mr. Robert Belcher, although the owner of "a large, white, pretentious dwelling surrounded and embellished by all the appointments of wealth," was "not a gentleman. He supposed himself to be one, but he was mistaken. Gentlemen of wealth usually built a fine house; so Mr. Belcher built one. Gentlemen kept horses, a groom, and a coachman; Mr. Belcher did the same. Gentlemen of wealth built greenhouses for themselves and kept a gardener; Mr. Belcher could do no less. He had no gentlemanly tastes, to be sure, but he could buy or hire these for money"; and then, more bitterly: "Of Mrs. Belcher and the little Belchers he saw but little. He fed and dressed them well, as he did his horses. All gentlemen feed and dress their dependents well." This delicate delineation of character reminds one of nursery-tales in words of one syllable; it is not the method of approved masters of fiction. This ungentlemanly person shows very clearly that the author's abuse of him, if inartistic, was by no means undeserved. He is rolling up wealth from the inventions of a man whom he had driven insane by persecution, and when Paul Benedict escapes from the pen in the town alms-house where he is confined, Mr. Belcher is tacitly suspected of having made away with him. Being dissatisfied with the hatred of his neighbors he betakes himself to this city, buys a costly house on Fifth Avenue, plunges into all sorts of wild speculations—as a bit of revenge on his fellow-villagers, he robs them of their earnings under pretence of enabling them to make their fortunes out of an oil-well—he owns a railroad, etc., etc.; in a word, he follows that path in which the late James Fisk, jr., made himself well known, and only comes to the end of his tether when, having forged Benedict's name to an assignment to himself of the former's lucrative inventions, he is detected in a court of law, and, to avoid punishment, flees from the country. When last seen he is engaged in the congenial occupation of keeping a bar on a St. Lawrence river-steamboat.

'Hugh Melton' is a novel of very light weight. The hero, who gives

*'Sevenoaks: A Story of To-day. By J. G. Holland, author of 'Arthur Bonnicastle.'' New York: Scribner, Armstrong & Co. 1875.
'Hugh Melton: A Story. By Katharine King, author of 'Our Detachment,' 'Off the Roll,' etc.' New York: Harper & Bros. 1875.

his name to it, is an officer of the English army. He is poor in worldly goods, but, to make up, is endowed with every honorable trait, and is, moreover, in love with an heiress. She is not insensible to his affection, but has engaged herself to marry another officer, Cameron by name—the latter being as much a fiend of darkness as Melton is an angel of light. The narrator, himself also a man of war, is a feeble character, who is deeply attached to Melton, and yet, being in love with the heiress, nearly leaves his best friend in the hands of savages in order to be secure from his rivalry. It is hard to find anything to like in this novel; there is a lukewarmness about all the characters and their perceptions and their virtues which fails to give the reader anything but a very mild enjoyment at the best, and but few readers will get even that.

A novel which is admirably adapted to serve as a warning for writers, a text-book for critics, and a rock of offence to readers, is 'Healey: a Romance.' One of the Healeys is a drunkard, for whom "the word 'ought' had no meaning till Thorgerd showed" him. In return for this piece of kindness he tried to marry her, not letting her know that he had a wife living. His sister, Katharine, was a most unpleasant person, of course totally unprepossessing, ill-natured, and of a very melancholy disposition, as this extract may show:

"Katharine that evening busied her mind with the weary problem which has so often been put: Who shall say whether this life of ours shall be called the Human Comedy or the Human Tragedy? Ought we to talk of life being a jest, or to weep over the 'Martyrdom of Man'? It is but a grim comedy, and yet it is somewhat small and ludicrous for a tragedy. . . . She was stirred to wonder vaguely what it all meant, and whether *some time* humanity will read the answer to the riddle—Life."

The love-affairs of a woman of this sort are tolerably sure to move at a very halting rate; and in fact one of her adorers is a very complicated villain with an eye to her money, and the other only an "overlooker" in her brother's mill, so that she has plenty of opportunity to ponder on the mystery of the universe and to soliloquize on the unsatisfactoriness of the world. At the end we are told that she married the poor but honest man, that they sailed to Australia, and that she was happy, but when once she had become happy there was no longer place for her in this 'Romance.'

The late M. Gaboriau, the author of a great many novels dealing with crime, the difficult detection of guilt, and its delayed but certain punishment, founded a small but busy school of writers who deal out murders to their readers as freely as do some of their brethren declarations of love. A good strip of Gaboriau's blood-stained mantle has fallen on the shoulders of one Fortune du Boisgobey, the author of 'The Golden Tress.' How many cups of green tea this writer drinks while he is at work upon one of his complicated novels it would be hard to conjecture. Certainly, only badly-shattered nerves could devise so ingenious a combination of horrors as is to be found in this short tale, which opens with a man carrying an unknown woman's head in a basket, and keeps the reader's interest alive by the singular disappearance of a young man who is kept imprisoned in the Catacombs of Paris, to which he has admission through a subterranean passage from his library; by the wiles of a Russian villain, who manages all the mischief of the book, throws the chief of police off the track, and nearly makes away with another detective, but who finally perishes in a quicksand; and by duels, poisonings, abductions, robberies, assaults, and gunpowder explosions innumerable. The great point of the book is the way the woman's head was cut off: she had just passed through the secret door mentioned above, when, hearing her lover's name called, she peeped back just as it was rudely closed, separating her head from her body.

'The Wages of Sin' is the title of Mr. Yates's last contribution to the circulating library. According to this austere moralist, typhoid fever is all that need be dreaded by a woman who has been unfaithful to her husband. The book reminds the reader of one of "Ouida's" worst novels with the "fine writing" left out.

Mrs. or Miss Steinestel, who translates from the German of A. E. Katsch a novel 'Under the Storks' Nest,' has a good theory about the task she set herself. She says in her preface: "The beauty of a translation consists in the harmony of the guise in which it appears. . . . To entertain the reader, and make him forget he is perusing a translation in the smooth flow of the language into which it has been adopted, is the first duty of a translator." Consequently, two pages further on in the body of the book we find this passage—Judge Berndal has just asked his servant for a pipe—"Here she is, Judge, loaded to the brim," the man answers. One can judge from the following of the romantic style which marks this novel: "Quick as an arrow sent from its bow, but noiseless as the wind that chases the cloud from the blue-vaulted sky, sped Mrs. Wurpel from the room and down the stairs into the apartment where lay the neglected child." Mrs. Wurpel was the monthly nurse.

The Rev. E. P. Roe takes better care of the moral tone of his novels. In this last one, 'From Jest to Earnest,' he describes the way in which a young and fashionable woman of this city attempted to break the heart of an unfashionable and awkward divinity student from Michigan, for her own amusement and that of her friends. She was not so successful, however, as was Lady Clara Vere de Vere with her young man, and it may be said by the way that her manners lacked the well-known aristocratic repose that stamped the caste of the English beauty. Lady Clara, for instance, would not have made so many bad puns as does Miss Lottie Marsden, the rescued flirt, nor, if she had, would Mr. Tennyson have deemed them worthy of printing. It would be only too easy to point out the literary defects of 'From Jest to Earnest,' but it is pleasanter, after calling attention to the great rarity of the words "shall" and "should," for which "will" and "would" are almost invariably used, to say that for the Sunday-school library this book is fairly well adapted.

A really good novel is 'Castle Daly,' which bears the sub-title of the 'Story of an Irish Home Thirty Years Ago.' To a great number of people the fact of its connecting itself with Ireland will not be an inducement to read it, for although there are many good stories about Irish life, there are more which less successfully combine the humor and pathos one expects to find in a novel about that country. Miss Keary has taken the following sentence from Fielding for the inscription on her title-page: "Whereas, for the composition of novels and romances nothing is necessary but paper, pens, and ink, with the manual capacity of using them"; but there is no one of the novel-writers whose names are in our list to-day who shows less belief in the seriousness of Fielding's statement. To begin with—she has drawn her Irish men and women and boys and girls admirably, for she evidently knows them thoroughly, and she puts their excitable, changeable, plausible, natural temperament before us with great dramatic skill; not as if she prided herself on her Irish stories, but everywhere subordinating them to the interests of her novel. Throughout, she is free from exaggeration; she manages with a very clever hand the various threads of her complicated story; and to an uncommon extent she succeeds in throwing a great many lights upon its action—that is to say, she does not narrate it from a single standpoint, either that of one of the characters or that of an outside, disinterested observer, but with a definite comprehension of each one, so that the *dramatis personæ* are all about equally well understood, and make very equal claims on the reader's sympathy. This will be clearer to those who have read the novel than to those who have not, and the former will perceive, for instance, how impartially the author holds the balance between the two Daly boys, Conner being as full of fire and flame and blarney as is his brother of caution, coolness, and reserve, and yet there is no blame for either, and each is allowed to show both his good and bad points without any appearance of the author's prepossession in favor of one or the other. Indeed, all the characters are well drawn and cleverly contrasted; take, for another example, Ellen and Lesbia. In this respect, it must be acknowledged Miss Keary is a very clever writer. The story is a long one and, we should think, a very probable one. There are half-a-dozen love-affairs running through it, and beneath all a sombre record of the sufferings of Ireland during the famine year, so that the interest does not flag in all the five hundred and seventy-six closely-printed pages. It is really a great pleasure to come across so unpretending, clever, natural, and, if the word may be used, so unmorbid a novel as 'Castle Daly.' It reminds us strongly of some of the best of Miss Edgeworth's novels with the strong bias taken out.

'Wild Hyacinth' has twin-sisters for its heroines, Christian, who is strong-minded and only on page 356 accepts her lover after he has rescued her from a burning house; and Hyacinth, who married, and was somewhat wild, having a lover who was struck dead by lightning just when she had dismissed him with some severity. She was herself made insensible by the same bolt, but she recovered and nursed her husband through the scarlet fever, taking advantage of his convalescence to get forgiveness for the innocent but somewhat stormy past. 'Wild Hyacinth' is much too long a novel; it would be better if only about half its present size.

'Healey: A Romance.' New York: Harper & Bros. 1875.
'The Golden Tress. Translated from the French of Fortune du Boisgobey, author of 'Les Collets Noirs,' etc.' Philadelphia: Claxton, Remsen & Haffelfinger. 1876.
'The Wages of Sin. By Edmund Yates.' Boston: William F. Gill & Co. 1875.
'Under the Storks' Nest: A Romance From the German of A. E. Katsch, by Emily R. Steinestel.' Philadelphia: J. B. Lippincott & Co. 1875.

'From Jest to Earnest. By Rev. E. P. Roe, author of 'Barriers Burned Away,' etc.' New York: Dodd & Mead. 1875.
'Castle Daly. The Story of an Irish Home Thirty Years Ago. By Annie Keary, author of 'Oldbury,' etc.' Philadelphia: Porter & Coates. 1875.
'Wild Hyacinth: A Novel. By Mrs. Randolph, author of 'Gentianella,' etc.' Philadelphia: J. B. Lippincott & Co. 1876.

Our old friend Robinson Crusoe, if he could come to life and be wrecked again with a band of Jules Verne's accomplished and energetic heroes, like those in 'Dropped from the Clouds,' would probably be left by them to starve as unworthy of his salt, on account of his deficient education and his persistent habit of idling and pondering over the position he was in. His fate would surely be settled in that way if he were to be found keeping another diary to console himself with. His polished descendants manufacture nitro-glycerine with scientific legerdemain, they alter the face of nature, find out their latitude and longitude, and set up brick-kilns and steel-works while poor old Crusoe would have been taming a cat and teaching a parrot, or at some such foolery. The peculiar form of scientific nonsense that M. Verne has put together may be left for the discovery of his readers; he certainly has written an amusing book, and he keeps the secret he is going to divulge later much better than do many writers of fiction.

The author of 'Rivers of Ice' also mingles instruction with the entertainment he offers youthful readers, but he lacks the French writer's ingenious imagination. His little story, however, is in no way deserving of condemnation.

---

*Thackerayana.* Notes and Anecdotes. Illustrated by hundreds of sketches. By William Makepeace Thackeray, etc. (New York: Scribner, Welford & Co. 1875.)—This is a very frank piece of bookmaking; but it may be said that if a book was to be made, the subject might have been less happily chosen. The first effect of this bulky and handsome volume is to renew our regret that Thackeray's life should apparently be destined to remain unwritten. Why does not Miss Thackeray attempt a biography of her illustrious father? We should be more grateful for it than for the imaginary memoirs of Angelica Kauffmann. It is certain at least that a most agreeable work might be performed in collecting Mr. Thackeray's letters. These are known to have been delightful, and nobody, surely, ever received one without jealously preserving it. That they were chiefly humorous, and that the humor frequently overflowed in some comical little pen-drawing, are facts of equally general knowledge. A large part of the purpose of this anonymously-edited volume is to reproduce a number of such of Thackeray's sketches as are scattered through early and forgotten publications and over the fly-leaves and margins of old (and otherwise valueless) books, procured at the sale, after his death, of his library. The editor has been a collector of these things, and, so far as knowledge of the subject goes, he appears very competent to perform his task. But it is a question how far this task was worth performing. Thackeray is to our sense very far from being the first-rate caricaturist the editor considers him, and it seems to us a decided mistake to thrust him forward in this light. We cannot agree with the critic in the *North British Review*, whom the editor quotes so commendingly, that the drawing in Thackeray's sketches is always excellent. The drawing seems to us to have almost as little skill as might be; even for an amateur it is exceedingly amateurish. The merit is in a certain frank expressiveness of a broadly comical idea—an expressiveness obvious, but never subtle. It is curious that, while Thackeray's humor in writing was so complex and refined, his comicality as a draughtsman is always rather bald and primitive. There are few of the rapid scrawls disinterred in the present volume quite worthy of the space they occupy. This reproach would not apply to such sketches as might be incidental to his letters; they would be at one with the comparative laxity of the text.

This volume excites our curiosity for biographical detail without very largely gratifying it. It relates some interesting circumstances about Thackeray's earlier years—such as the history of the establishment of the *Constitutional* newspaper, the luckless enterprise in which he sank the greater part of his patrimony; and it recalls some passages in his career about which most people have vague impressions, such as the very large amount of time which, first and last, he spent in Paris, the very quiet manner in which at first 'Vanity Fair' came into the world, etc.; but it is not apparent that the editor has had access to any recondite sources of information. His strong point is the Thackerayan bibliography. He knows, apparently, everything that Thackeray wrote in his 'prentice years—he knows all the books that he owned, and most of those that he read. Many of these latter seem to be in his hands, and he transfers whole pages of them to the present volume. When we call this a piece of book-making extraordinary, it is to the formidable scale of these interpolations that we allude. The practice of relating a man's life by stringing together whole chapters from books found in his library, and which he may be presumed to have handled, is one which promises to give a formidable extension to the writing of biography. We have here a copious condensation of Walpole's 'Castle of Otranto,' seventeen pages of dreary extracts from Rollin's 'Ancient History,' and a long account of Fielding's 'Joseph Andrews.' The pretext is that Thackeray made some boyish sketches in satirical illustration of these works. Text, therefore, and sketches are given us at formidable length. The reproduction of all might have been spared; the latter have but the minimum of skill. Thus there is a long and minute description, plate by plate, of a certain set of lithographic drawings, entitled "Flore et Zéphire"—a caricature of the ballet of the period, published by Thackeray in his youth. The plates are described as minutely and seriously as if they were drawings by Albert Dürer or Raphael; but, even were they more valuable than is to be supposed, the description would be rather ponderous reading. In another part of the book, no less than two hundred and fifty pages are occupied with a series of extracts from Earle's 'Microsmography'; from a certain 'Defence of the Female Sex,' published under William III.; from various works on demonology and magic (including that of Alfred Maury, the familiar French writer); and from the whole collection of the little journals of Queen Anne's time—the Spectators, Tatlers, Worlds, Ramblers, etc. Thackeray wrote 'Esmond' and the 'Humorists,' and he had obviously read these publications to good purpose; hence this wholesale transfer of their contents. If its felicity seems questionable, we may at least observe that it has helped to make the volume stout. But surely never was "padding" more ingenuously accumulated. Since the editor has such a taste for extracts, it is a pity that he did not exercise it in performances upon some of Thackeray's own less-known productions—upon those initiatory scribblings, for instance, in the short-lived *National Standard*, of which he has traced out the authorship. This was a weekly exponent of youthful views upon literature and art, published from 1833 to 1834, of which Thackeray was foreign correspondent. We must thank the editor, however, for quoting from the "*Snob*" *Magazine*, conducted by our author during his residence at Trinity College, Cambridge, the admirable little burlesque poem, with notes, entitled "Timbuctoo"—a parody upon one of the prize-poems of that period:

> "Desolate Afric, thou art lovely yet!
> One heart yet beats which ne'er thee shall forget!
> What though thy maidens are a blackish brown?
> Does virtue dwell in whiter breasts alone?
> Oh no, oh no, oh no, oh no, oh no!
> It shall not, must not, cannot e'er be so!"

The editor gives also a good deal of miscellaneous gossip about Thackeray's personal and literary career, much of which is welcome, even if not of the newest. There is no writer of whom one bears better being reminded, none from whom any chance quotation, to whom any chance allusion or reference, is more unfailingly delectable. Pick out something at hazard from Thackeray, and ten to one it is a prize. This volume makes us live with him a while, and refreshes our sense of his incomparable humor, and for that we are thankful to it; but we are almost ashamed to express our thanks, lest we should seem to be praising beyond conscience a reprehensible and inartistic style of book. It really strikes us as sad that this is the best that English literature should be able to do for a genius who did so much for it.

---

*Discourses on Architecture.* By M. E. Viollet-le-Duc. Translated by Henry Van Brunt. (Boston: J. R. Osgood & Co. 1875.)—The 'Discourses on Architecture' of M. Viollet-le-Duc have been fully reviewed in the *Nation* (see Vol. II., pp. 438, 469), and the great value of the work to students has been pointed out and insisted on. There is no doubt that the best answer one can make to the question so often asked of an architect, What book can you recommend which will give the reader a general knowledge of styles, and a general notion, not too vague, of the art? would be to name the 'Entretiens sur l'Architecture.' Unluckily, it is rather hard reading. Even to those persons who read Dumas and Gustave Droz, and even to those who get a fair share of the meaning out of Balzac and the poets, the pages of the great antiquary are somewhat repellant. It is not merely because the subject requires rather close attention at times, nor yet to any great extent because of technical terms, nor wholly because of a rather wandering treatment, not very consecutive, not sure to follow up the argument and have done with it; but from all these causes together there certainly results a book hard to read. And, therefore, although our community of reading people is supposed, in general, to read French, it is probable that but few persons have really read through the most useful book there is to a beginner in the study of architecture or of artistic archæology.

---

'The Mysterious Island: Dropped from the Clouds. By Jules Verne, author of 'Twenty Thousand Leagues under the Sea,' etc., etc. Translated from the French by W. H. G. Kingston.' New York: Scribner, Armstrong & Co. 1875.

'Rivers of Ice: A Tale Illustrative of Alpine Adventure and Glacier Action. By R. M. Ballantyne, author of 'Gascoyne,' etc., etc.' With Illustrations. New York: Pott, Young & Co. 1875.

Now, it is to be hoped that all this will be changed. The object of this notice is to tell all readers who may not have cared to enquire about Viollet-le-Duc and his lectures, so long as they were all together French and foreign, just what they will find if they take this book in its American-English dress. It is heavy in the hand; five hundred and sixteen large octavo pages. This was a fault in the original, and surely an unnecessary one there, for there is an atlas with the French edition, and a few more plates might have been taken from amid the text and put therein, and the text cut down to a much more handy size. In the Boston edition the large plates of the French atlas are set in by an edge, and folded, so that the large size is a quasi-necessity. But it is an evil still, and so is the folding of the plates, which can hardly be expected to bear much wear and tear. The type is large and the printing clear. The page is a pleasant one to look at, and an easy one to pore over and study. The plates and other illustrations are copied by some photo-mechanical process from the originals, and are satisfactory. The originals are not models of beauty, especially the large engravings; it may be that these reproductions answer just as well as they. What difference there is shows most in the woodcuts, but does not annoy even in these. The volume contains ten lectures, or the equivalent to the first volume of the 'Entretiens' (which was published in 1863), with, of course, the plates belonging to it. The remaining *Entretiens*, forming the second volume, appeared from time to time between 1863 and 1872, and those in an English dress Mr. Van Brunt does not as yet give us. They are, it is certain, of less general interest, and more the affair of curious and speculative architects than of students of the art as it has been and as it remains to us.

The chief value of the ten lectures which make up the volume before us is in the historical and critical examination of architectural styles. There is no statement to be found, at once so complete and so simple, of the essential characters of Greek as it is distinguished from earlier building; of Roman work as distinguished from Greek; of Romanesque and Gothic architecture as derived from and succeeding the Roman; and of the bringing of the classic revival from Italy; its modifications by the strong men of the time of Louis XII. and Francis I.; and the stiffening of all into the grandiosity of Louis XIV. This is in short the best critical treatise on style in building with which we have any acquaintance, and should be the hand-book of all readers of history, as opening to them the way to the more often talked-of than enjoyed study of history by means of the monuments of art. The lectures are here rather boldly paraphrased. The general tendency of the version is towards brevity and the matter of several of the French sentences is sometimes found in a single English one. The rather indirect way of putting things, with which the author is perhaps chargeable, is avoided, even to an extreme, by the translator. This shortening-up process seems to have done no harm, or but seldom to have done any harm, to the presentation of the author's meaning. "The architect of Charleval" serves as the translation of "l'architecte du château de Charleval"; "had a grandeur and dignity" does well for "avait un certain air de grandeur, un aspect majestueux." It has done no harm in general, one feels sure. Mr. Van Brunt's text, read by itself, without comparison with the original, is easy and clear, and the whole work of M. Viollet-le-Duc is to be found in it, complete and unmutilated, even if rather unusually "broken up and made over" into a new American treatise. We have found two places in which we think the author's meaning imperfectly expressed, but they are unimportant, at least to the general sense of the passages affected.

The conclusion is that this is one of the most important publications, not only in America, but in English, in the department of the fine arts. And it is to be hoped that the book will be read and used so widely and generally as to prove that there is room and a sale for a translation of the more learned, more extensive, more exhaustive, works on the Gothic art of France which have made M. Viollet-le-Duc's name the most celebrated among modern writers on the fine arts of decoration.

---

*West India Pickles.* By W. P. Talboys. (New York: G. W. Carleton & Co.)—A sketch of a three-months' cruise among the West India islands in midwinter is pleasant reading at this chilly season, especially when the recording yachtsman is skilled in the gentle craft of authorship. The charm of yachting is that it produces mentally a dreamy idleness that never shades into ennui, accompanied by excellent bodily health and an ever-ready appetite. In the tropics none of the necessary conditions are wanting: "A cloudless sky; smooth sea; good breeze; exquisite landscape; pleasant companions; a certainty of superior repasts in their due seasons!" "It would appear to be always afternoon to us, only that it seems always just before dinner, as the steward perpetually seems to be laying the cloth for some repast or other." Mr. Talboys had the good sense to see that in describing the only kind of lotus-eating endurable to the men of the bustling present, all "padding" of the useful and improving statistical sort would be absurdly out of place. He has contented himself with putting down what he really saw and felt and remembered—the secret of making an entertaining book. Only once does he wander off for half a page into science. It was in Trinidad; where he watched a colony of ants, "known as parasol ants, from the fact that each individual carries a leaf in his mouth which shades his back. These luxurious insects, on being disturbed, rush into their holes and bring out a lot of very large chaps with big heads and tremendous nippers, who at once assume an attitude of self-defence, being, in fact, the bullies of the establishment, while the gentle parasol-bearer stands aside to watch the fun. This is almost as surprising as Sir John Lubbock's statement that some tribes of ants keep milch cows, and also an old beetle, whom they worship as an idol," p. 108. A cruise like this is a pleasant episode in life, and these sunny tropical hours must give the lie to one-half of the motto the author read on the old sun-dial at Aguadilla:

"Vulnerant omnes—ultima necat."

*Incomparably the Best,*

And the only Unabridged, Enlarged, and Corrected Edition of

DR. WILLIAM SMITH'S

## *Dictionary of the Bible,*

Comprising its Antiquities, Biography, Geography, and Natural History, is that Edited by

Prof. HORATIO B. HACKETT
and EZRA ABBOT, LL.D.

"In short, it seems that we have to thank America for the most complete work of the kind in the English or, indeed, in any other language."—*London Bookseller.*

The grounds of its superiority to the English edition of the same work are these:

500 more pages and 100 more engravings in the American edition than in the original English.
26 American scholars represented.
More than 1,000 errors of reference corrected.
An Index of Scripture Illustrations, 56 columns, in the American edition only.

4 vols. 3,667 pages. 596 illustrations.

*Price.*—In cloth, bevelled edges..... $26
In full sheep..... $30 | In half-calf, extra..... 36
In half morocco..... 35 | In full calf..... 45

*THE RAILROAD GAZETTE* FOR 1876.

A weekly illustrated newspaper, similar in form to *Harper's Weekly* and the *Scientific American*, containing a complete record of current railroad news and discussions of the subjects most important to railroad men of all classes and to students of transportation, including articles by the leading railroad officers of the country. The course of railroad management and of discussion on transportation questions in other countries as well as the United States is carefully traced in the columns of this journal, which is read and highly commended by leading railroad men throughout this country and abroad.

"The merits of the Railroad Gazette are such as to have made it the vehicle of the best writing on the subject to which it devotes itself, and as a weekly publication it is likely to maintain its position as the leading though independent exponent of the railway interest in this country."—*The Nation.*

Those who subscribe now for the year 1876 will receive the numbers for 1875 from the time of subscribing. Terms, postage paid, $4 a year. Specimen copies free. Address
THE RAILROAD GAZETTE, 73 Broadway, New York.

## *Hans Brinker; or, The Silver Skates.*

(From an entirely new set of stereotype plates)

BY MRS. MARY MAPES DODGE.

With Numerous Illustrations from Designs by the Best Artists.

One vol. crown 8vo, elegantly printed on extra fine paper and attractively bound, cloth, $3.

Mrs. Mary Mapes Dodge's charming story of 'Hans Brinker; or, The Silver Skates,' which has rejoiced the hearts of the children of three or four countries, and is read by the old with almost as keen pleasure as it is by the young, is presented to the American public this year in a new and profusely illustrated edition. It is not necessary at this day to say anything of the book itself. As for the pictures, they are sixty or seventy in number, and are among the brightest and most successful designs of the French illustrationists. The artists have caught the spirit of the story wonderfully; they have been in sympathy not only with its more striking and picturesque passages, but with its most delicate meanings, its most subtle and winning suggestions. Altogether, 'Hans Brinker' cannot fail to gain hosts of new friends in its latest and most attractive dress.

*NEW YORK, THURSDAY, DECEMBER 16, 1875.*

## The Week.

THE report of the Secretary of the Treasury, which has drawn forth general commendation both for its clearness and soundness, estimates the receipts of the fiscal year ending June 30, 1876, at $297,456,145, and the expenditures at $268,447,543, leaving a surplus of $29,008,601. But the so-called Sinking Fund requires $32,293,692, so that the revenue will actually fall short by $3,285,091. For the fiscal year ending June 30, 1877, however, he expects a surplus of $34,735,000, which will more than provide for the Sinking Fund. He announces that the funding of the $500,000,000 of the six per cent. bonds into the "New Fives" has been completed, effecting a saving to the Government in interest of $5,000,000 annually; and, as $178,548,300 of this conversion has been effected in sixteen months, while the public credit is steadily improving, he believes that the rest of the six per cent. bonds might be funded at four and a half per cent., but thinks that the term of the four and a half bonds should be made thirty instead of fifteen years. The Secretary does not anticipate any marked revival in business or restoration of confidence until there shall be a "nearer approach to specie payments and a consequent improvement in the character of the currency," and denies that we can take the rank as a business people to which we are entitled by our national advantages as long as we have fluctuating standards of value, and he points out in forcible terms the injury inflicted on both producers and consumers by our inconvertible paper, which prevents our drawing in times of distress on the world's reservoir of real money. He maintains that the legal-tender notes are an evidence of debt which, when issued, were intended to be redeemed or converted into interest-bearing bonds at the earliest practicable moment, the redemption of which in coin has been pronounced by the Supreme Court a Government obligation, and has been solemnly promised by the Congressional declaration of March 18, 1869. He therefore recommends that the legal-tender quality of the notes should be withdrawn as to all contracts made after January 1, 1877; that the Secretary should have power to fund them in a four per cent. bond at the rate, say, of $2,000,000 a month; and fears that unless some such process of contraction is now entered upon, it will be difficult or impossible to provide the amount of gold necessary for resumption in January, 1879.

---

What the Report says as to the collection of the revenue is especially interesting. The import duties during the year 1874–5 showed a slight decline, which continued during the present year until October and November, during which months there has been a slight increase. Part of this decrease is due to the dulness of business, of course; part to the enlargement of the free list; but part also to smuggling and undervaluation. The success of smuggling the Secretary ascribes to the immense length of the frontier line, and the smallness of the preventive service, which, along the Canadian line, only supplies one man to every twenty-one miles, and to the height of the duty, which, when greatly out of proportion to the cost of the article, enormously increases the temptation. Undervaluation is due in part to the dishonesty of importers, in part to the fluctuation in values, in part to the defects of the appraisement system itself, and in part to the fraudulent collusion of the appraising officers with the importers. The difficulties of appraisement may be inferred from the fact that the tariff embraces 3,000 articles, either as dutiable or as free, some of which pay according to weight or quantity, and others according to value, and others, again, pay a compound of specific and *ad-valorem* duties. The Secretary recommends the substitution of specific for *ad-valorem* duties, which would almost render fraudulent undervaluation impossible, but he adds "that the only sure remedy for smuggling and collusive or other undervaluation at last lies in the selection and retention of faithful and competent officers. *Neither laws nor regulations, however stringent or minute, will accomplish the desired results without faithful officers to execute them.*" Touching on the whiskey frauds, he recommends a diminution of the enormous temptation offered by a tax amounting to three times the cost of the article taxed, but comes back once more to the old story by declaring that "the highest guarantee for the faithful collection of the revenue is the vigilance and integrity of the officials. This guarantee can be secured only by a careful selection in the first instance, by retaining in office such as have proved their efficiency and honesty, and by prompt dismissal and rigorous prosecution of such as have been found faithless." From which we conclude that he would like to celebrate the Centennial by a reform in the civil service, and is not so much troubled as his chief about "the possibly innocent plural wives" and the imported Chinese women.

---

It turns out that one of the President's suggestions for increasing the balance in the Treasury contains what the newspaper correspondents have termed "an extraordinary blunder." The President, it will be remembered, says in effect that some legislation is needed to prevent the recovery of fraudulent judgments in the Court of Claims; that large sums have been recovered upon mere affidavits for property appropriated or damaged by the army during the war, more being sometimes allowed to a claimant for his crops than his plantation is worth, as any one may see by riding through the country there. On endeavoring to hunt up these fraudulent judgments, the Washington correspondent of the *Post* speedily found that none in fact existed, for the excellent reasons that the Court of Claims has never had jurisdiction of claims for war damages, and that it never renders judgments on affidavits, but only upon the examination of witnesses, at which the Attorney-General or his legal assistants are always present to cross-examine. The fact (which the President probably did not understand) is that there are several classes of claims disposed of in Washington. The litigated business, being suits against the Government on contract, etc., goes on before the Court of Claims; the war-damage claims are investigated by a Congressional commission, though it does not adjudicate them upon mere affidavits; a third class is disposed of by officers of the Treasury Department, who *do* adjudicate them entirely upon *ex-parte* affidavits. The Attorney-General probably laid a mass of such information before the President, and he condensed it until it took the shape of the very singular misstatement which occurred in his message.

---

The removal of Mr. Henderson, the special counsel employed to conduct the prosecution in the St. Louis whiskey cases, has been the principal topic of the week in connection with the trans-Mississippi frauds. Mr. Henderson appears to be an able lawyer, and has been very successful thus far in procuring convictions; but in the Avery trial, having to deal with the Babcock telegrams, on which the General has since been indicted, he made observations which exceedingly incensed the President, and which, on submission to the Cabinet, were pronounced inexcusable, and proper cause for Mr. Henderson's dismissal, inasmuch as they insinuated that the President interfered to save the Whiskey Ring from measures taken by Douglas to break it up. Mr. Henderson has accordingly been dismissed, and it is difficult to see how the President could have taken any other course under the circumstances. Those who are finding fault with him are expecting a great deal more than they have a right to expect for fifty thousand dollars a year. There may be men in existence who would put up with what Mr. Henderson said, but

we doubt if they have as yet shown themselves in any civilized government. The proffer of the position to Mr. Glover, a Democratic lawyer, who refused it, and subsequently to Mr. Broadhead, another Democratic lawyer, who has accepted it, both men of eminence in their profession, is a sufficient answer to the insinuation which is freely made that Henderson's removal is due to a desire to abate the vigor of the prosecution in the Babcock case. Mr. Henderson was doubtless better fitted to conduct it than any one else, but his disqualifying himself is the misfortune, not the fault, of the Government. General Grant has often been too touchy, and has more than once seemed to sacrifice the public interest to his personal susceptibilities, but this can hardly be said of him in the present case.

---

Congress has not got into working order yet, and probably little will be done till after the holidays. There have been two measures introduced looking to early retirement of the greenbacks, and Mr. Blaine has put in his anti-sectarian Constitutional Amendment. Outside of Congress there is plenty of evidence of active preparation for the winter campaign. McMillan, the Louisiana anti-Pinchback claimant, has withdrawn from the contest, and this apparently leaves it open to the Senate to "save the State" by giving Pinchback the seat. The Democratic members of the House have held a caucus, and passed resolutions for the appointment by the chairman (Mr. Lamar) of a Democratic executive committee, to consist of three senators, six representatives, and three citizens of the District of Columbia, and of another committee of eleven members to suggest to the caucus at a future meeting a line of policy on public questions. Among the appointments made during the week are two which seem to show a determination to make use of all the machinery of the Government to keep the present leaders of the Republican party in Louisiana in power. One of these is the nomination for a position in the Custom-house of the president of the Returning Board of last year—the body which made itself responsible for all the turbulence, violence, and lawlessness that marked the organization of the State legislature, by sending in returns concocted in a manner declared by a committee of Congress to be "arbitrary, unfair, and without warrant of law"; and also (to succeed Judge Durell) of Mr. E. C. Billings. Durell, it will be remembered, was the judge who issued a midnight order such as Barnard used to promulgate in this city, empowering Packard, the United States Marshal, to seize the State House, and he resigned to save himself from impeachment. The *Tribune* remarks that the evidence taken shows that Billings was one of the lawyers whom Durell consulted on the occasion of the issue of this order, and "seems to have given advice about the form of the order, if he did no more." Billings is also said to be the friend of Norton, Durell's habitual "assignee" in bankruptcy. The *Tribune* says this is like "impeaching Cardozo to make room for Gratz Nathan"—a comparison which shows how far malice may carry a licentious and venal press.

---

The third-term discussion has been revived during the past two or three weeks in several curious ways. The New York *Times* has published an editorial admitting the possible danger to the party of a renomination in certain contingencies; the Chicago *Tribune* has published another, in which it has, with unusual brilliancy, suggested that General Grant might retire next year and be renominated four years later; while the climax has been capped by Bishop Haven, at a meeting of Methodist preachers in Boston, boldly recommending prayer for the renomination of the President, on account of the condition of the South. On its face, this movement appeared to have a good deal of meaning, particularly as General Grant listens to a Methodist minister in Washington, and for the additional reason that in his letter of a few months since, declining a renomination, he admitted that if it became an "imperative duty" he might be forced to stand again; and he has in his message declared the country to be in imminent need of salvation and in danger of bloodshed—a state of affairs which might fairly make him think it an "imperative duty" to remain at the head of the Government. It is only fair, however, to say that Bishop Haven is a highly erratic character, and that, according to the *Methodist*, his elevation to the dignity of Bishop has not prevented his remaining known as "Gil" Haven—a circumstance which may help a man in politics, but does not of itself prove authority in the Church.

---

A letter written by John Y. Foster, editor of the Newark *Courier*, to Mr. Blaine, and not intended for the public eye, has nevertheless got into print, to the consternation of the writer. The letter first made its appearance in a Democratic newspaper, having presumably been stolen from the mails or from Mr. Foster's office-boy. In it the writer says that he told Mr. Blaine eighteen months ago that he "could have New Jersey in 1876," and that he (Mr. Foster) wished now to "emphasize this statement"; he suggests a union of New England, the Middle States, and "strong votes from the South"; declares that a "potent faction" in the next convention will be the "secret anti-Catholic order"; adds that "Grant is a member," that it "has a good deal of strength in Congress," and that Mr. Blaine "ought to go in." "Grant," he says, "no doubt relies upon it to promote his aims," and, in his (Foster's) opinion, "the order is spreading widely." Mr. Foster has written another letter explaining the first, however, in which he says the order he referred to is that of the "United American Mechanics," which, "while rigidly excluding partisan politics from its councils," has as its cardinal principles "hostility to all sectarian interference in political affairs"; and that he has been told and believes "that this order, stimulated by the insolent attempts of the Romanists in New Jersey, Ohio, and elsewhere to convert our public reformatories, established and maintained by the public moneys, into sectarian institutions, with altars, confessionals, and masses, has within the last year or two grown rapidly in membership, and is still growing in numbers and influence"; that he thinks it no shame for any man to belong to it; but that he does think it wrong for Democrats, or anybody else, to steal letters, and that the Democratic editor who published the letter "has shown himself to have a lower sense of honor than the thieves that infest the slums of New York."

---

Mr. Henry Clews has written a singular letter to the morning papers, explaining his contract with Cheever and "James Van Buren" for a division of the profits of the Government Financial Agency in Europe. He says Cheever's claim against his estate is "fraudulent" and "bogus," and this is how it happened: Mr. Clews was at Washington in 1869 at a hotel, and in came Mr. Cheever, whom he had known and supposed to be a "retired merchant," and who said that he was living in Washington and was "associated with Mr. James Van Buren, from the West, a gentleman of powerful influence," and that he had agreements with several New York bankers under which he transmitted information to them, and, if they made anything by it, divided the profits with them, and Mr. Clews thereupon entered into a similar agreement with him at once. Cheever then announced that he and "Mr. Van Buren" and "large capitalists" were going to establish a bank in Washington, and asked Clews to keep their accounts and share any profits made through their agency, and again Clews closed with him. He also "suggested getting, in connection with the Clews firm, the Government Financial Agency in all the principal cities, and proposed to undertake it at once." Whether he accepted this last proposition or not Mr. Clews refrains from saying, but he denies that anything was done under it, and declares that the bank scheme also failed, and denies that the President or any member of his Administration had any interest, directly or indirectly, in the Government Financial Agency. What is remarkable in this is the extreme readiness with which Mr. Clews entered into business relations with a person he knew nothing about, and his confidence in "Mr. Van Buren, from the West, a gentleman of powerful influence," whom he had never seen or heard of before. The whole letter is one which makes one long to ask Mr. Clews questions, and

we trust Congress will see that he is questioned so as to make the whole thing clearer to his friends, and will try to secure "Mr. James Van Buren's" attendance. We regret to perceive that Mr. Clews does not deny the authenticity of the contract produced before the Registrar in Bankruptcy. He simply says that nothing was earned under it, and pronounces Cheever an untrustworthy person. Cheever has, however, appeared with a counter letter, making a conflict of veracity with Clews, and threatening him with "papers" and exposure in various matters.

---

As might be expected at this season of the year, dulness has been the feature in trade and in the Wall-Street markets. The latter were little influenced by the recommendations to Congress respecting the currency. It is not yet known what Congress may do, although the impression is general that there will be no radical changes. The political advantages to be gained by legislation which will make it certain that the Treasury will pay specie January 1, 1879, are not less than would be the advantages to every department of trade, and there is, therefore, reason for thinking that Congress will legislate to this end rather than away from it. But this is not yet sufficiently clear to be accepted as the groundwork for calculations either by merchants or Wall-Street brokers. While gold has ranged within narrow limits (114 and 114½), foreign exchange has been strong, the best bankers' bills rising to 4.85½ for 60-day, and 4.89½ for demand drafts. There has been no change in the London money market, although there has been an important movement in gold from London to the Continent, particularly to Paris. The Bank of England has a large gold reserve, and evidently expects to get gold from here, possibly before the close of the year, and certainly early in the new year. This expectation is reasonable, considering the strength of the foreign exchanges here before the demand to cover January interest collections on European account has set in. Money here has been in better demand, rates advancing to 6 and 7 per cent. The New York banks are still sending currency to the South; the demand from the West has slackened, and currency has been coming in from the Middle States. Early in January, the return-flow from the West begins, and, two to three months later, that from the South. A disposition must be shown by the present Congress to enforce specie payments by the Treasury in 1879 before there will be a full employment of idle money. Capitalists are sheltering their money as they have been doing since the panic, but so soon as they are assured that they can at least get back as good as they lend, new enterprises will be encouraged, and the loan market will be healthfully quickened. The value of $100 greenbacks has ranged during the week between $87 33 and $87 71.

---

The annual returns made by the Eastern Railroad Company to the Massachusetts Board of Railroad Commissioners have revealed a state of affairs in the finances of that corporation which, though not wholly unexpected, differs so widely from the returns of previous years, and from statements published in the interest of the railroad in the early part of the current year, as to afford a new and very striking example of the extent to which a corporation may become involved while its credit is still unsuspected by the public. The returns show that the debt of the company now amounts to $14,833,500, while the amount paid for interest during the year has been $892,362; the debt having been increased by $2,508,247, or 20 per cent., above the amount reported a year ago, and the interest paid having been increased by $139,031. Moreover, so much of the debt has been incurred within the year that the large interest-charge of the past year is evidently less than would have to be provided for in the coming year. On the other hand, the gross receipts have decreased from $2,971,815 in 1873-74 to $2,827,291 in 1874-75, a decrease of 5 per cent., and the net earnings for the year are returned as only $757,419; of this amount $200,916 has been absorbed by rentals, leaving only $556,503 to pay the interest of the year, or less than 63 per cent. of the amount which has been paid, and only 3¾ per cent. on the total indebtedness.

Genuine sensation has been caused in Germany by the publication of an anonymous pamphlet, under the title of 'Pro Nihilo,' the author being evidently Count Arnim, who was already dead in public opinion, and has now managed to kill himself over again. The best policy for the Government, so far as the effect on public opinion is concerned, would have been to give the pamphlet the widest possible circulation; instead of that, it has been everywhere confiscated. If there still remained a doubt that Count Arnim is a person absolutely unfit to be trusted with any office of responsibility, this pamphlet has removed it. If papers addressed by the highest public official to a diplomatic agent in his quality as ambassador may be appropriated by the latter and communicated to the whole world as documents relating to a "private conflict," then the foreign offices might as well henceforth transact their whole business by public criers on the market. The most important document is a letter from Bismarck to Count Arnim, dated June 19, 1873, in which Bismarck commences by stating that the Count, in a report of June 8, addressed directly to the Emperor, concedes "that the best government in France for us would always be one which has to devote the greatest part of its strength to overcoming its inner enemies." "Your Excellency has for eight months maintained the opposite view, and succeeded in making it prevail with his Majesty." Thereby the overthrow of M. Thiers has been, "if not directly brought about, at least facilitated, by paralyzing my efforts to maintain" him. The oft-repeated assertion of the Count that the continuance of M. Thiers at the head of the French Government "must become dangerous to the monarchical principle in Europe," has made an impression on the Emperor. "The influence exercised by your Excellency here has not allowed me to give you the positive order to throw the whole weight of our policy into the balance for the maintenance of M. Thiers." "I find myself in a position to take upon myself the responsibility for this political blunder [of not having supported M. Thiers with all possible energy] and the situation produced by it, although I cannot feel obliged to do so after the efforts I have unceasingly made in the opposite direction." The influence exercised by the Count on the Emperor has "no longer an ambassadorial, but a ministerial, character." "My strength is too much exhausted, . . . . besides attending to my regular duties in the Cabinet of his Majesty, to carry on a contest with an ambassador opposing my policy." The Chancellor will propose to the Emperor to take the steps "necessary to maintain unity and discipline in the foreign service, and to secure the interests of his Majesty and of the Empire against unconstitutional injury."

---

The French Assembly has been absorbed during the week in the election of the seventy-five senators whom it has the right of choosing under the new constitution. At this writing, forty-two have been elected, of whom thirty are Republicans of one shade or another, and the others are Legitimists or Conservatives, who came in as the result of a compromise. The Republican success is the result of the greater unity of the Left than of the other sections, which are greatly broken up by personal jealousies, a large number of their members being gentlemen who have never been in political life before, and see no chance of getting into it again unless sent up to the Senate by the Assembly. The Left and Left Centre are very free from these influences, and are thus able to act with unusual concert. Several of the leading military men are chosen, but Messrs. Buffet, De Meaux, and Wallon of the Ministry have been defeated, and have withdrawn from competition. These senators sit for life, and an election of anybody "for life" in France now excites more or less merriment, there being so many men, both public and private, who have survived offices which they fondly hoped to fill until death. But it is impossible not to feel that the new senators have a better chance than any of their predecessors of serving out their term, because they are the first officers of their kind who have been put in their places by a rational process, and after full discussion.

## GENERAL GRANT AS A LEGISLATOR.

THE President is empowered or directed by the Constitution to recommend "to the consideration of Congress such measures as he shall judge necessary and expedient," and General Grant is certainly using his authority freely and with remarkable confidence. He recommends in his last message an amendment to the Constitution making the maintenance of free public schools incumbent on each State, and forbidding the teaching in these schools of "religious, atheistic, or pagan tenets," or the granting of State aid to any religious sect or denomination; and advises the taxation of church property, and the exclusion from the franchise, after the year 1890, of all persons who cannot read or write, the suppression of polygamy and of the importation of women for illegitimate purposes, and the repeal of the Legal-Tender Act as regards contracts to be fulfilled after January 1, 1877. These are all subjects of the first rank in importance, about which there is a great deal to be said on both sides, and any one of which, it is safe to say, would of itself afford both Congress and the country food for as much reflection as they are equal to; but the President has so thoroughly made up his mind about them that he recommends the settlement of the whole of them next year as a sort of celebration of the Centennial. It is worth notice, too, that none of them except the last are what may be called pressing questions, and he takes them up and disposes of them somewhat in the manner of an inquisitive traveller, who, in passing through a country and noticing what he considers an abuse, says, "This is all wrong, and ought not to be allowed," without troubling his head about difficulties or details.

The truth is that in dealing with most of the problems of civil government the President is literally a traveller in a strange land, and no one has filled his chair with so little previous preparation for the place through education or social experience. He is, indeed, it may be said, the only man who has taken his seat in it without having a stock of settled opinions on the leading points of American politics, and he finds it now, at his time of life, impossible to get up a steady and persistent interest in any of them. New things strike him, therefore, nearly every year, and his mind works on them with a certain feverish or youthful activity and then turns to something else. The views he forms on them, too, though often marked by a strong common-sense, are, in the literal sense of the word, crude—that is, have evidently been formed without prolonged reflection or mature consideration of difficulties; they are, in short, the kind of views that a man forms over a cigar after dinner, and are apt to be pervaded by the same healthy morality; for when men are not cynical after dinner, they are apt to be exceedingly hostile to vice in all forms. For example, the President, in his inaugural address, propounded the plan of paying the national debt with the product of the Western gold and silver mines, which is exactly an after-dinner idea likely to take hold of a man in an indolent mood, when unwilling to ask himself why it should be easier for the Government to pay its debts with the mines of private citizens than with their potato-fields. He took up the reform of the civil service, too, evidently without having any clear idea of what he meant by it, and abandoned it as soon as he really came into contact with Mr. Curtis's rules and saw how they were going to work. The civil-service problem is still the most important problem of our politics. It includes nearly every other problem. Almost every abuse which now occupies the public mind may be traced back to it by one channel or another—the whiskey frauds, the Indian frauds, the pension frauds, the Schenck scandal. Examine any one of them thoroughly, and you will find that it originated either in the appointment of men who ought not to have been appointed or the retention of men who ought to have been dismissed. And yet of civil-service reform the President in this last message—to which he expressly gives a valedictory character, and in which he displays great solicitude about the future of the Republic—says not one word. Two years ago his mind was supposed to be full of it; now he thinks no more about it. He dreads the teaching of "religious, atheistic, or sectarian tenets" in the public schools, and is troubled about the taxation of church property, Mormon polygamy, and Chinese prostitution; but the conversion of the eighty thousand officers of the Government into electioneering agents apparently gives him no concern whatever. The reason is that the subject has passed from his mind, as San Domingo has, and he is occupied with something new; and his views on the new thing are just as superficial and as lightly held as his views on the old one, and will probably last no longer.

In saying this, we cast no imputation on his sincerity. We have no doubt that his mind is just now troubled about the schools, and the churches, and the Mormon and Chinese women, and that his recommendations about them are honestly made. But it would be a great pity if any respect for his sincerity and for his position enabled him to provide the American people at this juncture either with topics of political discussion or with issues for party contests. It has to be borne in mind that, in selecting General Grant for the Presidency in 1867, nobody thought of him for a moment as a legislator, although his reputation in that field undoubtedly stood higher than it does now. He was chosen because Mr. Johnson's aberrations had led people to fear some violent attempt to upset or neutralize the results of the war and to look for a long period of turbulence and disorder at the South, and was supported the more heartily by many—ourselves among the number—because they supposed that his military training, and the sagacity he had shown in the selection of his military subordinates, would qualify him to deal energetically and efficiently with what it was plain would prove after the war the crying evil of the day—the condition of the hastily organized administrative service. His complete failure as a civil-service reformer, however, involving, as it has done, also his failure as a pacificator of the South, is now known to everybody. The South has settled down at last into something like peace and quiet, owing to the very excesses of the rascals whom the Administration put in charge of it. They behaved with such reckless audacity that they ran their course and opened the eyes of the Northern public in less than five years; but they had a firm and tenacious supporter in the President down to the very last. His latest message on Southern matters was an incoherent proposal that Congress should overturn the State Government in Arkansas in order to give the Carpet-bag Ring another chance of ascendancy and plunder. Of the condition of the civil service the revelations at St. Louis, Chicago, and Milwaukee are a sufficient illustration. In fact, there can scarcely be said to have been any improvement in this field during the last six years. The present pursuit of the St. Louis offenders is so thoroughly Turkish in its character that rejoicing over it would be absurd, particularly since the indictment of General Babcock. "Let no guilty man escape" is a good enough motto for Bajazet or Mahmoud, but what civilized rulers should say is, "So organize and appoint and test that the chance of guilty men getting into office shall be small." To slaughter the Janissaries or Mamelukes was perhaps a good thing, but it would be better never to have any Janissaries or Mamelukes.

In making suggestions, therefore, for legislation, except as to the immediate exigencies of the Government, the President, though perhaps discharging a constitutional duty to the best of his ability, is doing something for which he is hardly qualified, and which nobody when he was elected looked for at his hands, and for which nothing in his official career has revealed any fitness or capacity. There is, of course, little reason to suppose that any of his suggestions will be embodied in laws, however worthy of attention some of them may some time become, but they may just now prove mischievous in distracting public attention from the burning questions of the day. The country is in no such danger, either from the "possibly innocent plural wives" of the Mormons or from the Chinese harlots, or from the accumulation of untaxed property in the hands of the Church, or from the assaults of the priests on the public schools, as it is from the McDonalds, and Joyces, and Shepherds, and Caseys. It is they who are the real polygamists, and priests, and demagogues, and harlots of our time. It is they who threaten

school and church and home with desecration or destruction. They are the real sappers of the foundations of liberty. It is they and their kind who, "ever since the fall of Adam for his transgression," have been the worst enemies of popular government, the forerunners of tyranny and degradation. They are the real foes of the public schools. Their taxed property is a greater injury to the state than all the untaxed ecclesiastical property in the civilized world. The loss of faith in justice, in law, in individual honesty, in man's capacity for self-government, which is caused by their operations, is the great political danger of our time, to which the people ought to give their attention. Laws are but words on paper until they come to be executed; justice is but a name unless the law stands behind it; and whether the laws are executed or justice finds support in law, depends on the character and capacity of the men who fill the civil service of the Government. No nation ever yet perished, or even suffered seriously, because the legislation was defective. In civilized countries, as a general rule, the constitution or the acts of the legislature on the whole make for security and tranquillity; the decay, when it sets in, results from the inability of the government to get fidelity and obedience from its servants. In Turkey, to-day, the people would be happy and prosperous if the Sultan's edicts were carried out. It is because the civil service is filled with knaves and peculators and ignoramuses who pay little heed to his edicts that the Empire is going to pieces. Some of the signs of the times among ourselves bear a comic resemblance to those of the great historic declines. What, for instance, could be more striking and instructive than the handing over of the Indian service in despair by the President to the missionary societies? Does it not look absurdly like the rise of the bishops into the position of civil rulers when the Roman administration went to pieces under the blows of the barbarians? And is not such a confession of helplessness on the part of the state enough to set men thinking as well as laughing?

## THE ALARM ABOUT THE SCHOOLS.

THE apathy with which the public has received the signs of alarm exhibited by the President and some politicians about the public schools, shows pretty clearly that we are not likely to have any general agitation on the subject at present. No such agitation could be stirred up by any man's opinions or apprehensions. It will come, whenever it comes, from attacks on the common-school system by a body of voters sufficiently large to make people fear that they may eventually succeed, and no such attacks have as yet been made, nor are they likely to be made for a good while, if ever. Mr. Blaine's proposal, therefore, that the danger should be averted now by an amendment to the Federal Constitution, forbidding the States as well as the United States to establish a church or devote taxes to the support of sectarian institutions, will probably not receive the attention it merits. It would no doubt put a stop to a process which we shall probably witness hereafter with increasing frequency in all the States, and particularly the States which have a large city population—the process of making covert appropriations of public money, or granting privileges which are the equivalent of money, under one disguise or another, to Catholic societies, schools, and charities. We say Catholic, because the Catholic Church controls the largest number of voters who are willing to vote in ecclesiastical interests, and who can, therefore, be used most effectively in support of ecclesiastical bargains or enterprises. These appropriations are never very large, because the Church is prudent and bides her time. She has a sense of permanency such as belongs to no Protestant denomination, and is, therefore, always able and willing to take pay in instalments, and feels that some day or other she will have the sum she needs. This mode of accumulation, too, is helped in a remarkable degree by the secresy of her financial management. The laity are drawn on incessantly for all sorts of objects, but they never know what is done with the money. No disagreeable public discussions, therefore, ever occur over the accounts. If mistakes are made, they are not heard of outside the episcopal parlor, nor is there ever any loud public proclamation of wants. The Church works without haste, but without rest, and noiselessly, and is served by a permanent, powerful, and thoroughly-disciplined corporation. The reason why she makes so many little assaults on the treasury of this city and State is, that while she has here, as elsewhere in the Union, a sense of wrong in being forced to contribute to the support of schools she does not approve of or use, she knows she is strong enough numerically here to be worth courting in politics, and easily persuades herself that in getting little appropriations of one kind and another she is only getting back a portion of her own. If there were, therefore, a constitutional prohibition of such appropriations, it might stop a leak which bids fair to increase in size. But, after all, it is only a leak. It is only by a great stretch of imagination that we can really fancy its protecting us against a church establishment or a real division of the school funds among sects, and it would be very difficult to discover any real alarm on the subject in any part of the country. Alarm about it would doubtless be a convenience to a great many people. There is a large number of gentlemen in politics who would like amazingly to see the public mind absorbed in resisting the insidious encroachments of the Papacy, instead of concentrating itself on accounts, and vouchers, and "outrages," and telegrams, and reports—subjects which doubtless have a certain meanness and narrowness about them, but which happen at this moment to be to the American citizen the most important of all subjects. The Pope will keep. He is tough and tenacious, and can be laid low just as well twenty-five years hence as now, while the "Bosses" are daily disappearing with the money, and, once gone away, never return.

It ought to be said in all honesty, however, that those who think the public schools are not all they ought to be have a good deal to say for themselves. The Catholic clergy, who clamor for religious instruction as a necessary part of education, belong to a school which includes a good many Protestants, and which does not believe in the policy of leaving the character to be moulded by circumstances after the arts of reading and writing have been supplied. In fact, the discussion which is now raging over the school question, both here and in England, is almost as much between the friends of little and those of much training, as between those of secular, and those of religious teaching. The former do not want the state to take any responsibility about the child's moral culture, and the latter want it to take a great deal, and they know no way of securing moral culture except by the systematic teaching of religious beliefs. But it is easy to see why these should have a much harder task here than anywhere else. There is probably no country in the world in which there is at this moment less faith in the possibility or expediency of influencing character in youth by purely didactic methods than in this. The whole tone of society and the spirit of our institutions are against it. Hardly anything is believed among us, by either young or old, because somebody has said it. There are probably fewer people among us than anywhere else in the world whose theory of life is not the result of their own experience, or who are under many obligations to authority for the solution of moral problems. Indeed, the overthrow of authority has been so complete that it has worked the ruin of doctrinal preaching in the pulpits. Doctrinal preaching is necessarily authoritative. It consists in the dicta of commentators, but few persons are found willing to listen to dicta. The result is that the ministers are drawn more and more into a sort of co-operative speculation, in which the congregation can take part, and in which the nearest approach to instruction consists in the suggestion of probabilities and the drawing of analogies. There are, too, in all classes, and even in the churches, differences of opinion as to the sanctions and origin of moral rules, and as to the precise connection of morals with religion, which, however slight, would prevent any united action even in any one denomination as to the kind of moral instruction which should be given in the schools by the state. The feeling that "they didn't know everything down in Judee" is far wider and deeper than the people who are fretting themselves about the safety of the schools imagine it is. It is concealed by denominational statistics,

but only faintly concealed. The denominations which make fewest demands on members for definitions of their beliefs are growing more rapidly than any others, and those which a few years ago were most exacting on this point are silently relaxing their discipline. In fact, there is an enormous and growing amount of vagueness of belief about all the higher problems of existence concealed under both church-going and church-membership.

It would be a great mistake, too, to suppose that the Catholic Church is exempt from these influences. There is, as her history has shown, no power either in her creed or her discipline to save her from the action of the various modifying agencies of modern civilization. She may not have changed her doctrines or machinery, but her members have changed, so that she has no longer the same hold on the world. A man's going to mass and confession does not mean now what it meant even fifty years ago. No government in our day is afraid to encounter her. Bishops go to prison in Prussia without exciting much more attention than if they were defaulting clerks, and the Pope's curses in Rome die on the empty air. Catholic laymen, too, after they get above the peasant class, know well that a man is somehow in our time not so well equipped for the fierce and bitter struggle of modern society by a clerical education as by a secular one, and shrink more and more from encountering the scientific school burdened with clerical solutions of physical and moral problems. Nobody is thoroughly easy with a creed which keeps him constantly on the defensive in the society of other educated men, and Catholics are very apt in our time to find themselves in that position. So that, altogether, it is hard to see any reason for believing the school question serious, though there is no doubt it may here and there prove troublesome.

## A GENERAL REGULATION ACT.

WE observe that the Democrats in Congress have, as a measure of precaution, formed a committee to which they mean to refer all bills and resolutions emanating from their side of the House before producing them publicly. The following bill, which has been sent to us for publication, seems to us eminently worthy the consideration of this committee. We do not approve of all its features, and think it carelessly drawn in many places, but it covers more ground and contains more of the results of "advanced thinking" than any piece of legislation with which we are acquainted. We ask for it a respectful perusal, and trust it will not be made the subject of unseemly mirth. Nothing seems to us more disheartening and alarming than the tendency to jocose and flippant treatment of plans for the elevation of the masses which a portion of the press and many politicians are in the habit of exhibiting.

*BE it enacted by the Senate and House of Representatives of the United States of America in Congress assembled*, That specie payments are hereby resumed. The Secretary of the Treasury shall cause to be printed a placard bearing an announcement of the fact, and shall post the same conspicuously upon all the outer doors of the Treasury building.

SECTION 2. *And be it further enacted*, That in order to remove all cause of controversy as to the meaning of the term specie payments as used in this act, it is declared that the true intent and meaning of the same is the right to discharge, in lawful money or legal-tender notes of the United States, any debt or pay any tax to the Government which is by existing law to be paid in gold coin. And the resumption of specie payments effected by this act shall not confer upon any holder of United States notes the right to call for the redemption of the same, nor upon any creditor of the United States the right to demand coin in satisfaction of any claim which is by existing law to be paid in lawful money.

SEC. 3. *And be it further enacted*, That the Secretary of the Treasury is charged with the duty of making the volume of the currency equal to the demands of trade, which shall be done without undue expansion of the currency and without any contraction whatever.

SEC. 4. *And be it further enacted*, That the Secretary of the Treasury shall issue lawful money of the United States, secured by a pledge of all the wealth of the nation, to all persons who may wish to borrow the same, taking as security for the same mortgages of real estate if the applicant is the possessor of such property, and if not, then of such personal property as the borrower owns. But there shall be no discrimination in favor of or against any person in consequence of his wealth or poverty, and all persons shall be put upon an equal footing as borrowers.

SEC. 5. *And be it further enacted*, That the Secretary of the Treasury shall prepare bonds of the United States, bearing interest at the rate of 3.65 per cent. per annum, payable principal and interest in lawful money, which bonds he shall issue at par, receiving therefor lawful money of the United States, and shall redeem the same on demand. All sums received for bonds shall be immediately employed in the purchase of bonds of the United States bearing interest in coin at the market rate (provided the same shall not be presented for redemption under the provisions of Section 6 of this Act), and when a demand for the redemption of such 3.65 bonds shall be made, the obligation shall be met by a new issue of legal-tender notes.

SEC. 6. *And be it further enacted*, That three months after the passage of this act interest shall cease on all the bonds of the United States on which the interest is to be paid in coin, and the same shall be called in for redemption in lawful money; *provided, however*, that no bond presented after the lapse of one year from the date of such call shall be redeemed either in coin or in lawful money.

SEC. 7. *And be it further enacted*, That all laws or parts of laws impairing or denying the right of any person to make and issue notes as money, or to coin any metal, are hereby repealed. It shall be lawful for all persons to make and issue money of such material and in such form as may to them seem expedient, and all money so issued shall be a legal tender for the payment of all debts, public and private, to and from the Government and between individuals; and no discrimination shall be made by any person in favor of or against any particular kind of money. But it shall in no case be lawful to export any of this national currency to points outside the United States of America.

SEC. 8. *And be it further enacted*, That since by the provisions of this act it is placed within the power of all persons dwelling within the United States to acquire wealth without dishonesty, and since thereby the temptation to commit crimes against property has been removed, all such crimes are hereby abolished, and all laws of the United States or of any State affixing penalties to the offences heretofore known as theft, larceny, forgery, embezzlement, and similar acts, are rescinded and repealed.

SEC. 9. *And be it further enacted*, That all railroads built, or to be built, within the United States, are hereby declared to be public highways. All persons shall have equal rights upon the same with the owners thereof, and no railroad company shall pay to its stockholders dividends amounting to more than three and sixty-five hundredths per cent. in any one year, under penalty of forfeiting its charter.

SEC. 10. *And be it further enacted*, That the uniform rate for transporting passengers on any railroad in the United States shall be one cent for each mile travelled; and any company charging or collecting more shall forfeit its charter to the person or persons who shall prove to the satisfaction of any court that the provisions of this section have been violated.

SEC. 11. *And be it further enacted*, That no company shall make any discrimination in favor of or against any point or place on its line, in any manner whatsoever. In the transaction of passenger business all trains shall run to and stop at all stations to take or leave passengers; and any person requesting to be transported from one station to another shall be carried at such time as will best suit his convenience. Each company shall so arrange its tariff for the transportation of merchandise that no person shall be placed at a disadvantage by reason of his residing at a point more remote from his chosen market than others who have for sale articles similar to those which he offers; and no charge for the transportation of freight shall exceed the rate of one half cent for each ton of freight carried one mile.

SEC. 12. *And be it further enacted*, That whenever a memorial signed by ten citizens of the United States, setting forth that in their opinion a railroad is needed between any two points, and that for reasons stated private capital cannot be induced to engage in the enterprise, shall be presented to the Secretary of the Interior, he shall issue a charter for such railroad, and shall certify to the Secretary of the Treasury the fact of such charter. And the Secretary of the Treasury shall, on receiving an affidavit that the company has been duly organized, issue to such company bonds of the United States to the amount of fifty thousand dollars for each mile of the projected road, to be applied to the construction of the same, unless the directors shall determine otherwise.

SEC. 13. *And be it further enacted*, That the Government of the United States assumes control of all the telegraph lines in the United States, and will purchase all existing lines at a valuation to be fixed in each case by three disinterested directors of the company whose line is taken. And all messages shall hereafter be sent at a uniform rate of one cent a word with-

out regard to distance ; *provided, however*, that no charge shall be made on any message sent to or from any member of the Senate or House of Representatives.

Sec. 14. *And be it further enacted*, That on the petition of five residents of any city or town in the United States not enjoying telegraphic facilities, a line shall be extended to such city or town at the public expense.

Sec. 15. *And be it further enacted*, That the monopoly known as the Associated Press is hereby abolished.

Sec. 16. *And be it further enacted*, That in order to enable the manufacturers of the United States to compete successfully with the cheap labor of Europe, the importation from foreign countries of all articles in a manufactured state, articles similar to which are produced in the United States, is absolutely prohibited and forbidden.

Sec 17. *And be it further enacted*, That all laws imposing a tariff or duty on the importation of foreign goods are hereby repealed.

Sec. 18. *And be it further enacted*, That all acts imposing taxes upon domestic productions and upon dealers in the same, and requiring stamps upon any instruments, constituting the system of taxation known as internal revenue, are hereby repealed.

Sec. 19. *And be it further enacted*, That the right of suffrage is hereby extended to women and children. Votes may be cast for infants in arms by their mothers, *provided* that such infants shall give their personal attendance at the polls.

Sec. 20. *And be it further enacted*, That while we welcome to our shores the people of every nation, the immigration of persons of the Mongolian race is prohibited, and it is declared to be the duty of the Government to protect Caucasian and African labor from losing, through the advent of a swarm of Asiatics, the compensation to which it is entitled.

Sec. 21. *And be it further enacted*, That, inasmuch as there is no desire on the part of anybody to create a religious establishment for any State or for the United States, the Constitution is hereby amended by adding thereto a clause to prevent this imminent danger.

Sec. 22. *And be it further enacted*, That while the right to tax real estate or to refrain from taxing the same is wholly within the control of each State, advice is hereby given to the States that they would do well to tax church property.

Sec. 23. *And be it further enacted*, That there shall be no sectarian religious teaching in any school established by any State.

Sec. 24. *And be it further enacted*, That in all public and private schools in the United States such studies shall be pursued and such text-books used as the pupils in each school may direct. No pupil shall be compelled to learn morality from any book to which he, or his parent or guardian, or the spiritual adviser of his parent or guardian or of himself, offers objection. Teachers are prohibited from inflicting corporal or other punishment upon pupils ; and they shall enforce no rule in the government of their schools until the same shall have been approved by a unanimous vote of their pupils.

Sec. 25. *And be it further enacted*, That in all courts of law in the United States, all presumptions shall continue to be, as they now are, in favor of persons accused of crime. All motions by the counsel for prisoners made with the intention of delaying trials, shall be granted. The justices of the courts of the several States and of the United States are directed to prepare (with the assistance of lawyers trained in the preparation of technical points designed to effect the release of criminals) new rules of evidence, which shall the more effectually prevent witnesses from telling all they may know of the matter under trial, in case such evidence would lead to the doing of substantial justice.

Sec. 26. *And be it further enacted*, That in case any part of this act shall be pronounced unconstitutional in any court of any State or of the United States, the President is hereby empowered to add to the number of justices from time to time, and to appoint so many as may be necessary to procure a reversal of all decisions adverse to the validity of this act.

Sec. 27. *And be it further enacted*, That all causes that seem to delay the coming of the millennium are hereby removed ; all laws that impose any restraints of any kind upon the liberty of any citizen are rescinded ; all acts and parts of acts inconsistent with the provisions of this act are hereby repealed ; and this act shall take effect immediately.

## THE CENTENNIAL.

PHILADELPHIA, December 8, 1875.

THE managers of the Centennial have made, or are about to make, a demand upon Congress for an appropriation. As the times are anything but favorable for such calls upon the national purse, the readers of the *Nation* will be interested in learning the present condition of the enterprise, its prospects, and the motives which lead the managers to take the present step. Last Friday I made a thorough inspection of the grounds and buildings. Fortune favored me with the last pleasant day of the season, and I had the additional advantage of securing the kind offices of Gen. Norton, who served as guide with unwearied patience for many hours. Although aware, through previous experience at Vienna, that great things can be accomplished by well-directed energy, I was not prepared for the truly wonderful changes that have been wrought at Philadelphia within a twelvemonth. It would be but a slight exaggeration to say that the Exhibition buildings are ready now, months ahead of the time. Certain it is that they will be in readiness to receive goods early in February. Let me take up the several buildings in order.

The Machinery Hall is finished, and has been formally handed over by the contractor to the general direction. Workmen are now laying the foundations for the huge Corliss engine in the centre that is to supply the motive-power to the shafting. The tanks and reservoirs for the department of hydraulics—by the bye, omitted at Vienna—are either finished or well under way. Several of the supply-boilers are on the ground. The flooring is laid, except in places reserved for the foundations of heavy machinery. A surveyor is now engaged in marking out on the floor the spaces for different exhibits. The view from the upper gallery at the end of the hall is even now impressive. One can take in at a glance its magnitude and handsome proportions, and above all its adaptation to the purposes for which it is built. It is beyond question the finest machinery hall yet erected, and when filled and in operation will surpass London, Paris, and Vienna. The light is excellent, and the general appearance is that of neatness. It is in every respect a marked contrast to the ungainly, untidy structure in the Prater, and is worthy of the nation whose industry it is intended to display.

The Main Building is not so far forward, but the work that remains is inconsiderable in amount and of an easy kind. The building, as building, is completed, but the flooring is still to be laid in great part, and the decorative painting of the interior is not yet begun. It will be pushed vigorously as soon as the committee have decided upon the pattern and color. Several columns and panels have been ornamented as samples of the various styles from which the selection is to be made. Six or eight weeks of quiet, regular work will probably suffice for the completion. There is no danger of interruption from the weather, as the outer walls and roofing are finished.

The Memorial Hall, or art building, is about as far advanced as the main building—*i. e.*, the outer walls and roofing are done, with the exception of the cupola, where the workmen are now fitting in the few remaining panes of glass. In the interior the plastering and flooring are being pushed with as much rapidity as comports with good workmanship. The building being heated by steam, the plastering will be continued throughout the winter. Many of the black-walnut doors and panels are already finished. Inasmuch as this building is not only permanent, but fireproof throughout, the construction-materials being exclusively brick, stone, and iron, its growth is truly remarkable. Everything indicates that by the end of February or beginning of March it will be "swept and garnished" and awaiting the pictures and statues. Those who remember the agony with which the art building at Vienna was literally rushed in the spring of 1873, will be pleased to learn that there is no danger at Philadelphia of a like overhaste and tardy opening.

The Horticultural Building, also permanent, is finished, and indeed partly occupied. At least, one of the galleries is heated, and contains some fine specimens of orange-trees in fruit, cactuses, india-rubber trees, and other hot-house flora. The steam-pipes for the main hall are very nearly in order, and the workmen are arranging the soil for the beds. The visitor will probably pronounce this Horticultural Hall the prettiest and most attractive building on the grounds. Its dimensions, 383 by 193 feet, are larger than those of the palm-house at Vienna, it is better planned, and the decorations—polychrome frescoes and arabesques in the Moorish style—are charming. In its grace of contour and warmth of color it will afford a pleasing counterpart to the Renaissance lines and sober hue of the art building.

Agricultural Hall is the most backward of all. It met with a slight mishap early in the fall, the first few arches being blown down by a sudden gale before they had been fairly propped and stayed. But this accident has been promptly repaired, and the work since then has progressed at an extraordinary rate. Those who visited it only six weeks ago declare that it has grown like a mushroom. The simple nature of its structure explains the phenomenon. It consists of a nave, 820 feet in length, crossed at right angles by three transepts, each 540 feet in length. The framework of nave and transepts is a succession of slight and extremely-pointed

Gothic arches of wood. The arch is put together on the ground. When finished it is raised into position, shored, and attached to the arches already up by beams, upon which is laid the roof. About two-thirds of the arching is up, and for the most part roofed. Should the present mild weather continue, arching and roofing may be completed by the end of the year; a good deal will still remain to do. Each of the eight ends is to be flanked by towers, making a sort of façade, and the central point of the building is to be crowned by a tower. The spaces between the transepts (outside of the nave) are also to be covered over by secondary arches, parallel to the transepts but much lower. Still, the work is well in hand and need not be suspended, except in very heavy snow or rain or extreme frost. At all events, Agricultural Hall is considerably in advance of the agricultural buildings at Vienna. In general, I feel no hesitation in saying that the Philadelphia Exhibition has a start of at least three months over its predecessor. I base the assertion upon the impression that I obtained during a week's visit in Vienna at the end of January, 1873. No one of the great buildings there was at that time as far on as the corresponding building now is at Philadelphia.

What is true of the buildings is equally true of the grounds. The walks, drives, artificial water-courses and lakes, the grading, sodding, and garden work, at the Centennial are all that the friends of the enterprise can desire. And here it may be said that if not equal to the Bois de Boulogne in point of artistic development, the grounds have great natural advantages which make them much superior to the Prater enclosure. They are high, well drained, properly diversified, and decidedly picturesque. In one or two places they are intersected by ravines varying in depth, to be spanned by rustic bridges. From the eastern side one has charming views of the Schuylkill Valley here and there. George's or Reservoir Hill, on the west, overlooks the ground and buildings. Near this point has been erected a tall look-out tower, ascended by a steam elevator. From the top there is a superb panorama of river and city. The Main Building and Machinery Hall are in a line forming the southern boundary, the others are dotted somewhat irregularly over the grounds to north, east, and west, and present a very agreeable diversity of lines and angles. The central point is near the southeastern end of the United States Government Building. Here the principal walks intersect, and from here the eye can sweep over the great buildings ranged around. Unless we have an exceptionally severe and protracted winter, I see no reason why the Centennial may not be opened, according to programme, on the 10th of May, with turf and flowers and walks and the other paraphernalia of landscape gardening as far advanced as they were at Vienna by the end of June. There is not a little grading still to be done, but the two months from March 10 to May 10 should be amply sufficient. Besides, our picks and shovels and dumping-carts are much better, the railroad-tracks in the grounds are as three to one, and the visitor can scarcely help noticing every minute the difference between the American and the Austrian way of doing things. One of our laborers seems to accomplish as much as two in Austria. I may add that the building for the exhibition of the several departments of the National Government is almost finished. Some pieces of heavy artillery are already in position outside. The offices of the English and Japanese Commissions are under roof, and the same may be said of four of the five large restaurants in the grounds. The track of a narrow-gauge dummy-railroad to encircle the buildings, and carry visitors from one to the other, is partly laid.

The contemplated arrangements for conveying visitors to and from the grounds seem to me to be a near approach to perfection. I doubt whether such complete arrangements were made at any previous exhibition. The grounds, be it observed, lie in a sort of triangle between the main line of the Pennsylvania Railroad and the Junction Railroad. Both lines—over which passes the entire Eastern, Western, and Southern traffic, through and local, of the city—are already within a few hundred feet of the gates. It is the intention of the Pennsylvania Railroad to construct sidings and a large temporary station just outside the southern gate. The Reading Railroad, with its main line and its Germantown and Norristown branches, can also use the Junction Railroad. Finally, passengers by the old Amboy and the South Jersey lines can be ferried across the Delaware to Washington-Street wharf, and thus be carried by the southern freight-track of the Pennsylvania Railroad around the city to the Junction road. It will not be necessary to go into further particulars. An inspection of the topography of the city and its remarkable railroad connections will show that visitors arriving by rail, from whatever quarter, can be landed directly at the gates without change of cars. The city railways are also in excellent order. Many of the lines running east and west already have their termini at the southern gate, and the others will terminate at this gate or the eastern gate by next spring. The capacity of both steam and horse roads has been tested with satisfactory results. To the exercises held on the grounds on July 5 of this year were conveyed 133,809 persons, in great part children from the public schools. Of this aggregate 25,309 were conveyed by train service, and 108,500 by street-cars. These last, it is true, were unable to take all who offered themselves, and many thousands were compelled to walk. But, on the other hand, it is to be noted that no one foresaw such an immense concourse. The car companies were consequently unprovided. Warned by this experience, they are now making their preparations for doubling and even trebling their capacity, and assert that by spring they will be able to move daily at least 250,000 without delay or inconvenience.

Concerning the arrangements for lodging and feeding the thousands and millions of guests that are expected, I cannot speak with like confidence. Not that I doubt in the least that all who come will find good shelter and suitable food. But personal comfort is not a thing to be measured, weighed, or counted off in figures. Those who visit the Centennial must be prepared to forego some of the comforts of home and to pay a little higher price. But there will be ample room for all, and I venture to cherish the belief that there will *not* be that wholesale system of plundering and extortion that marred the first three months of the Vienna Exhibition. The existing hotels in the city are manifestly inadequate, and although the new hotels now in course of erection and very nearly finished in the immediate neighborhood of the grounds will accommodate 4,000 to 5,000 additional, still the tourist's chief reliance must be placed upon the boarding and lodging-houses. This subject is now being thoroughly worked up by the Centennial Lodging-house Agency. The managers are the agents of the Pennsylvania, the North Pennsylvania, and the Baltimore Railroads, Mr. Jenkins, of Cook's well-known tourists' agency in London, and Mr. Allen, editor of the *Railway Guide*. The object of the agency is to enter into arrangements whereby travellers can purchase railroad coupons entitling them to board and lodging at reasonable fixed rates. Philadelphia, it is known, has more spare rooms than any other city in the country. The number might be set down at very nearly 100,000. If the agency, then, can secure one-half the number, say 40,000, or only 30,000, it will have solved the problem. The number of new houses nearing completion in West Philadelphia, in the vicinity of the Exhibition, is very considerable. These new houses alone can be made to accommodate several thousands. The Centennial has developed already so much energy and such unexpected resources that we may look forward to the solution of this problem also in the right way and at the right time. Two circumstances are of great moment. The one is that the mass of visitors will be homogeneous. The number of foreigners, however great, will be trifling in comparison with the natives, who are used to expedients and quick in helping themselves over the inequalities of life. The other is that the people of Philadelphia, rather apathetic on the point a year ago, are now awaking rapidly to a sense of its vital importance. They begin to perceive that, unless they themselves lend a helping hand, the very object of the Exhibition may be frustrated. There are evidences among the wealthier classes of a disposition to remain in the city during the summer and keep open house for their friends, while the middle and lower classes are warming up, so to speak, to an unwonted step—namely, to let rooms and take transient boarders. From what I have gathered during my stay here, I am persuaded that there are hundreds and thousands of housekeepers who are now seriously considering the question whether, as the saying goes, "it wouldn't be just as well as not to make a few dollars out of the Exhibition." The question is a novel one to them, but they will probably find only one answer to it.

The report on the finances of the Centennial has been submitted to Congress in an official document, which is within reach of every one. It will be unnecessary for me, therefore, to enter into a detailed statement of figures. But a brief explanation will serve to make the figures more intelligible. The Machinery, Memorial, and Horticultural Halls are permanent buildings, the gifts of the State and city, and paid for by State and municipal appropriations. But the Main Building, Agricultural Hall, the various annexes, the grading, bridging, gardening, the general offices and current outlay, must be provided for by other means. Stock subscriptions to the amount of $2,357,750 (of which $1,852,000 have been paid in) and concessions of privileges have been the chief source of income. The managers state that the sum of $1,537,000 will be necessary to complete their work and open it on the 10th of May free from debt. They rely upon entrance-money to pay working expenses and refund the stock subscriptions. They pray Congress, therefore, for an appropriation of this sum of $1,537,000. It must be admitted that their position is a strong one. According to a trite adage, nothing succeeds better than success. Last year the Centennial might be said to exist only on paper or in the imagination of a few zealous

advocates. Within twelve months it has put on shape and proportions; it is a definite creation, recognizable by all. Those who have it in charge have shown by unmistakable evidences of every kind that they know how to plan and work. A cursory glance at the grounds and buildings ought to convince the most sceptical that the managers have labored with great wisdom and economy, making every dollar yield its full return. Doubtless the consciousness of being thrown on their own resources has been the strong incentive. In so far, then, the former refusal of Congress to aid may be said to have been a gain; it has suppressed extravagance and sharpened the wits of the managers. But it may be well to admit that there are limits to all things, even to economy and wit-sharpening, and that nothing discourages good disposition more effectually than the failure to obtain practical recognition and sympathy. The managers approach Congress, saying: "We have done all that men in our position could do. We have accomplished something of which you and we have reason to be proud. But unless you are willing to let us begin operation under the burden of debt, you must help us. Please remember that our failure will not be our but your lasting reproach; for you have consented to enjoy the benefits of the Exhibition, you have accredited us abroad, you have invited foreign representation, you have given us a national character." Such language can scarcely be called an argument. Neither is it, on the other hand, a mere appeal to sentimentalism. It is a call upon the practical sense and good-will of the nation's representatives. I believe that the Congressional visit, which is announced for Friday, will convince Congressmen that the Centennial is, in truth, a great and noble enterprise, national and international in every sense, and deserving of aid. No one, it seems to me, can inspect the grounds and buildings and fail to be charmed with them. An experience of six months and more at Vienna warrants me in saying that the Centennial, although on a somewhat smaller scale, will be finer in many respects. It will certainly be more manageable, and hence more enjoyable. To look upon the Centennial as a purely local undertaking to the greater glory of Pennsylvania and Philadelphia, would be doing it grave injustice, in the face of palpable facts. The exhibition from the country at large is adequate, and already the demands for space from some of the States, Massachusetts, for instance, are greater than the supply. The credit and profit to be reaped by Philadelphia will not be greater than the city is justly entitled to for originating and prosecuting the enterprise.

## LONDON SIGHTS.

[FROM AN OCCASIONAL CORRESPONDENT.]

LONDON, Nov. 10, 1875.

WHEN the Albert Memorial was completed and uncovered in London more than a year since, and displayed through the smoky air its treasures of florid architecture, there was much almost ribald jesting at the way the local atmosphere was destined to blight its gilding and its precious stones. The thing seemed like a sort of magnificent satire upon the London climate Some five years ago the beautiful new structure of the Royal Academy was brilliant with its carved white stone and its gleaming statues; to-day it is of a dusky, smutty gray, and to-morrow it will be as black and hoary as Westminster Abbey and St. Paul's. Having seen the Albert Memorial just after its erection, I was lately curious to observe whether its splendor had as yet begun perceptibly to wane. It must be confessed that up to this moment it has made a very successful resistance. It will have the best wishes of all lovers of the picturesque for its continued success; for whatever may be thought of its artistic merit or of the moral necessity for having erected it, it at least may be valued by the London wayfarers as the sole specimen of vivid color in the metropolis. Its position of course helps to preserve its purity, with the vast open spaces of Kensington Gardens beside it and behind it in one quarter, and the mitigated contaminations of the far-spreading terraces and crescents of Prince's Gate, Queen's Gate, etc., facing it on the other. Readers interested in these matters may be reminded that the Memorial stands on the edge of Kensington Gardens, opposite the great red-and-yellow rotunda of Albert Hall—a sort of utilitarian Coliseum, which, I believe, has not been found very useful. The Memorial is a wonderful combination of British sculpture and architecture, gilding, mosaic, and the work of the lapidary. It consists of an immense gilt canopy of Gothic design, under which an image of the Prince-Consort is destined to repose. It rises colossally from a huge embankment, as it were, of steps, at each corner of which is a group in marble representing one of the four great continents. The "motive" of these groups is sufficiently picturesque, a great local beast, of heroic proportions—the bull, the bison, the camel, and the elephant—being in each case the central figure; but the sculpture, like all the sculpture, is second-rate and common. It is the work, of course, of the highest English skill—of Messrs. Macdowell, Bell, Foley, and Theed. At each angle of the upper platform where the shafts of the canopy rise is another group—"Manufactures," by Mr. Weekes; "Commerce," by Mr. Thorneycroft; "Agriculture," by Mr. Marshall; and "Engineering," by Mr. Lawlor. Round this outer base of the canopy runs an immense frieze in white marble, executed half by Mr. Philip and half by Mr. Armstead, representing, a trifle below life-size, the array of the world's great artists—poets, painters, sculptors, musicians, and architects. They have been sagaciously chosen and cleverly combined, and the most expressive and original portion of the sculpture is here, we should say, especially on Mr. Armstead's side. As for the canopy itself, with its flamboyant Gothic, its columns of porphyry, its statues and statuettes of bronze and gold (or seeming gold), its chased and chiselled jeweller's-work, its radiant mosaics, its thick-strewn gems of malachite and lapis and jasper and onyx and more rare stones than we know the names of, its gables and spires and pinnacles and crockets, its general gleaming and flashing and climbing and soaring, its great jewelled cross at the summit—all this quite beggars description. We should say in general that the workmanship throughout has been of a finer sort than the original taste, and that if the Memorial preserves in the future the memory of our present knowingness in architecture, it will also perpetuate the modern weakness of that art which once unfolded the friezes along the Parthenon and suspended the tombs in the Italian cathedrals.

The exhibition of paintings by Gustave Doré now on view in London ceased a good while since to demand notice as a novelty, but has become one of the regular sights of the great city, and it suggests some reflections that are always pertinent. The general air of the establishment is not so much that of a temple of the arts as of an enterprising place of business. The pictures seem to be placed on view chiefly with the design of securing subscribers to certain projected engravings. The agents for subscriptions are liberally diffused through the rooms, and, as they mingle "quite promiscuous" (as the London vernacular has it) with the visitors, the latter are liable to be buttonholed in the midst of such attentive contemplation as Doré's canvases may have provoked. The engravings are to be executed in England, in the finest and smoothest style of the old-fashioned "line." It may very well be that the pictures will gain on being reduced to small dimensions and to simple black and white, for they look, as a general thing, like "illustrations" hugely magnified and rather crudely colored. The exhibition is of course an interesting one, and gives an extraordinary impression of imagination, vigor, and facility. On the whole, doubtless, one ought not to be afraid of enjoying it. We may be tolerably sure that, where his pictures are wanting, M. Doré knows it, that he has deliberately chosen to do only what he conveniently could, and that he has settled it in his mind that a magnificent effect, however obtained, is its own justification. The artist's "convenience," we are at liberty to infer, has been to cover an immense quantity of canvas and make a great deal of money. As for his effects, the best of them are certainly magnificent. The only valid criticism of Gustave Doré must rest, it seems to me, on the admission that in the degree to which he possesses the temperament of the designer—in energy, and force, and consistency of talent—he ranks with the few greatest names. He has a touch of Michael Angelo about him; the fact that he is an enterprising Parisian of the nineteenth century ought not to make this inconceivable to us. In the power to compose an immense combination of figures at short notice he recalls two of his greatest predecessors—Rubens and Tintoretto. We may prefer Rubens and Tintoretto, and yet do justice to other members of the family. It is Doré's own fault if so often we find it very easy to prefer them. He has chosen to work by wholesale, and so very often did they, who, however, had the advantage that wholesale painting in their times, owing to the essential tone of men's thoughts, could not of necessity be so superficial as it may be to-day. Their merit is that, whatever they did, they always achieved something that may be called painting; and Doré's fault is that half the time his work is not painting at all. It is a rapid, superficial application of turbid and meaningless color—an imitation of painting not always particularly skilful. The two great things in London—the "Christ coming down from Judgment" and the "Tapis Vert"—are full of examples of this. The latter of these—a very cleverly imaginative representation of the gaming-table at Baden-Baden—is well known by photography, and known very favorably. The photograph flatters it, and so probably will the engraving, in giving it a charm of detail which the original lacks. The other picture—one of the largest ever painted—is full of imagination, skill, and power, and looks, as we intimated, like one of Doré's most successful drawings shown by a magic-lantern. It is a most extraordinary performance. The other pictures are full of cleverness and invention, especially

certain "Christian Martyrs in the Coliseum," a heap of corpses lying in the empty arena, with wild beasts prowling over them in the blue starlight, and cold, phantasmal angels hovering above. The landscapes are singularly bad, many of them looking for all the world like second-rate American work. The best things have a merit which the way Doré has cheapened himself has made at last to seem trivial, but which would seem quite incomparable if it had been more abruptly presented. Their great fault is that they have no agreeable passages of painting—nothing exquisite, nothing that looks not only as if the artist had lingered over it, but as if he had even paused at it.

## Notes.

J. B. LIPPINCOTT & CO. have nearly ready 'The Orphan of Pimlico,' a collection of sketches, fragments, and drawings by the late W. M. Thackeray, edited by Miss Thackeray. The drawings are reproduced by facsimile.——Stieler's Atlas, which has put off the detailed map of Africa as long as possible, is obliged to come to it in the last but one of its issues, Part 29 (New York: L. W. Schmidt). This number contains plates of Northeastern Africa and Arabia, and of Southern Africa (below the equator) and Madagascar, along with one of Spain and Portugal. In Part 26 of Stieler, by the way, a map (No. 45) showing the British Islands and adjacent waters with their soundings, indicates the fatal Kentish Knock and the neighboring shoals so lately the scene of the distressing accident to the *Deutschland*.

—An extremely valuable annual, the 'Deutsches Akademisches Jahrbuch,' has just made its first appearance in Leipzig (New York: L. W. Schmidt). It is a sort of directory, aiming at completeness, to the academies of science, the universities, and higher schools of technology in Germany, Austria, Switzerland, and the German provinces of Russia, and forms a compact volume of more than 700 pages. A number of attempts of this kind have been made within the past hundred years, and some have had a fair success, but the field appears to have become open again, especially on the statistical side, which has been practically neglected since 1812. A list of these calendars; historical sketches of the rise and spread of academies and universities both in Germany and in the rest of Europe; and brief accounts of the more ancient and now extinct German universities, precede the directory proper. As a sample of this, we may take first the University of Berlin (pp. 34–75). Under this head we find given its origin, the statutes under which it was founded, the government and faculties, the entire list of instructors, the academic societies and their badges, and, finally, lists of rectors and deans, and statistics of instruction and attendance from 1810 to 1874 in the various departments of the university. Under the Prussian Academy of Sciences, we find a list of actual members and another of members deceased in 1873–74. The technological schools are somewhat more restricted in their statistics, nor is every institution treated with equal fulness except as regards *personnel*. The appendix gathers up the loose ends, adding and correcting, and indicating the latest changes among officials and professors; and the *Jahrbuch* closes with a copious index of persons. We have omitted to name the industrious compiler, Hans Adam Stoehr, lately librarian of the Dresden Deutsche Akademie der Naturforscher, which dates back to the year 1652, and which has this curious distinction that to every member's real name is added an academic designation (*Beiname* or cognomen). Formerly, these cognomina were drawn from the myth of the Argonauts, to which the quest of science was likened. But nowadays the president assigns a name of some departed worthy having a more or less obvious relation to the member's favorite pursuit. Thus, to take the American membership, Prof. Henry answers to the appropriate name of Smithson; Prof. Dana is to the Academy Pliny XII.; Profs. T. Sterry Hunt and Charles A. Joy, Humphry Davy I. and II. respectively; Dr. Asa Gray is Walther II, etc., etc.

—The late Johns Hopkins, wishing to establish a home for orphan colored children, a training-school for female nurses, and a hospital for four hundred patients—the hospital to be a part of the Johns Hopkins University—placed three millions of dollars, besides adequate real estate, in the hands of trustees, and sketched his wishes with comprehension and clearness. He neither trammelled his agents with unnecessary restrictions nor set them adrift on a sea of possibilities; and he especially enjoined them to obtain the advice and assistance of those skilled in hospital construction and management. The result of carrying out these instructions is a valuable volume, of three hundred and fifty pages, entitled 'Essays upon Hospital Organization.' The contributors are Drs. Norton Folsom, of Boston; Stephen Smith, of New York; Casper Morris, of Philadelphia; John S. Billings, of the Army; and Joseph Jones, of New Orleans; and it is clear that the trustees are now suffering from an embarrassment of riches. They offer this treasure to the world as in consonance with the beneficent designs of the founder, and they solicit instructive criticism. Professor Jones's is the only paper that does not rise well above mediocrity, and the volume is probably the best exposition of the present state of this branch of knowledge; while occasional conflicting views hint at the inexactness of much of our so-called science. The intention which any hospital expresses is one of the highest forms of human benevolence, but benevolence does not always culminate in beneficence, and it sometimes strays into direct disaster. A hundred years ago, one-fourth of those admitted to the Hôtel Dieu died there. Twenty years ago, one in two died in the Koulali hospitals on the Black Sea. Such grave mortality means radical errors, and these errors sanitarians are now seeking to discover and uproot. Besides the regulation of space, fresh air, temperature, and light, which indeed is necessary for the maintenance of health among the well, the sick require protection against the evils which they themselves create, and which collectively are known as hospitalism. The worst form of hospitalism depends upon poisoning by organic germs that may effect a lodgment in the edifice or in its furniture, and serve to propagate serious disease indefinitely. The prevention or the removal and destruction of these is the sanitary problem of the day. To epitomize the varied and plausible suggestions made in these essays would lead too far into special studies. The cautious but liberal policy pursued by the trustees leads us to hope that they will not throw away the opportunity to establish such a medical college as Dr. Billings and Dr. Smith sue for; that is, one that shall look only to the quality and not at all to the number of its students and its graduates. Medicine, by the confession of its leaders, is full of "half-baked" men. Johns Hopkins, by the amount and the spirit of his benefactions, has made it possible that the graduates of one American school shall be "done through." A hospital founded for the propagation of disease would be the physical counterpart of a new college on the old plan—to turn out more classes, like ready-made clothing, in ranks of uniform insipidness and unreliability. An appendix by Mr. John R. Niernsée, architect to the Board, describes the plan adopted for the colored orphan asylum, and a second paper by the same author gives an ingenious architectural study of an octagonal ward. The index is well arranged for a book by different authors, but it is incomplete, and a slip occurs in it, as well as more than once in the body of the work, where August is written for Angus (Smith). The volume, which is illustrated by many plans, is published in good style by Wm. Wood & Co., and must become a reference-book of the first order.

—Dr. Wharton's admonition in a recent *Lippincott's* that the priests and votaries of Spiritualism might any day find themselves in court—perhaps to their disadvantage—was not premature. His article was hardly off the press when the now famous Ward will case was called in Detroit, bringing mediums and believers and "manifestations" upon the scene. The late Eber B. Ward fell dead in the streets of that city, of apoplexy, in January last. He left five grown-up children by his first wife, whom he had divorced in order to take another. His widow has two small children. Of the former, one is insane, one imbecile, and two—the brothers Milton and Charles—are at least capable of very queer conduct, and have been unsuccessful in their attempts to conduct business on their own account. These last set about contesting their father's will before his body had yet reached his home. The instrument was found to have two codicils, the second of which, added six months after the first, directed the executors, as trustees, to pay each of the five children (who were otherwise comfortably settled) not more than $200 a month for their support, unless in case of sickness. About a third of his property, including several extensive business interests, he bequeathed in fee simple to the second wife. The estate, being valued at something like four millions over and above liabilities, was a prize worth contending for, and some of the ablest counsel in the Northwest were employed on both sides. The will was attacked as being the production of a man who was either insane or under undue influence at the time. To prove Mr. Ward insane his belief in Spiritualism was alleged, but this was ruled out by the judge, on the ground that Spiritualism was a religion, like any other, and he allowed the fact to have a bearing only upon the question of undue influence. Thereupon, a number of mediums were brought forward to testify to Capt. Ward's frequent consultations with them, both for ordinary purposes and with a view to making his will. It was shown that he had a sort of familiar spirit known as "Cabbage John," a German geologist, who advised him as to the merits of all sorts of speculations; and the medium through whom this savant acted consented in open court to go into a trance, and was taken possession of by a spirit who would not answer to

questions in English, but when asked—*Wie heissen Sie?* replied, "Andrew Kurthaldrus," and would apparently have been more communicative if the audience had been more inquisitive. The original draught of a communication from departed relatives of the testator's second wife was produced, and was manifestly in accord with the final provisions of his will. On the other hand, many witnesses testified to Capt. Ward's repeated declarations that he had no implicit faith in the superior wisdom of the spirits, but held their advice always to be subject to mundane judgment. And the fact that from being a cabin-boy on the Lakes he had amassed an enormous fortune and become the leading capitalist of the Northwest, either proved his substantial independence of ghostly counsel, or else that such counsel might profitably be sought by the rest of mankind. Such was, in fact, the variety of his enterprises, that "he smelted iron at Wyandotte, Milwaukee, and Chicago; mined silver on Lake Superior, and copper in Arizona; cut timber in the Muskegon prairies, and in Ohio and Wisconsin; made plate-glass in Missouri; controlled or projected railroads in Michigan, Iowa, and Louisiana; and still found time to attend to his duties as a director of one of the national banks of Detroit, to serve that city as a member at large of its Board of Estimates, to write an occasional 'open letter' on the currency, and to make his influence felt in important political and public movements."

—After forty-five days of patient listening the jury disagreed, except that they all thought the second codicil to have been unduly executed. All but one thought Capt. Ward competent to make a will; eight thought the will and codicil had been made under undue influence. The judge's charge was at least noticeable. He warned the jury that they were not called upon to pass upon the truth or falsity of Spiritualism, adding that the Court could not if it would enlighten them about it, and that it was "just possible that a decision of this Court on that subject would not be regarded in the only tribunal in which it could be of any service to us." The fact that Captain Ward believed in the reality and importance of spiritual communications, "and even did consider them in relation to the will in question, or make the will in accordance with such communications," would not of itself tend to show unsoundness of mind. "But if such communications are received to the exclusion of the testator's own judgment, acting upon them not because he approves them but only because he believes them to be given by spirits of departed friends, giving up to them entirely his own free will, I need hardly say to you that a will made under such circumstances would not be the will of the testator." It deserves to be mentioned that no evidence was offered or suggested to connect the surviving Mrs. Ward with the communication, purporting to come from her father and cousin, by which the will was shaped; so that no charge of conspiracy could be brought against the medium (who lived away from Detroit). She earned her usual fee, we may suppose, without collusion, and without any interest in the issue of the struggle between the disembodied "Polly" and "R. Lyon."

—The controversy as to the art-frauds of American sculptors in Italy has received a temporary quietus. Mr. Pierce Connelly took Mr. S. W. Healy to court as a calumniator, and Mr. Healy's principal witness, Franchini, broke down, with unmistakable signs of having traded in his principal's credulity. The result was a sentence of the defendant to a fortnight's imprisonment and a fine of $200, and of the publisher of his organ, the *Touriste*, to half the penalty. An appeal has been taken from this decision, but with no great prospects, so far as we can see. In the nature of the case, charges like those brought by Mr. Healy can be proved only with the greatest difficulty.

—The French scholar, Georges Perrot, Member of the Institute, has recently published a collected volume of essays, entitled 'Mémoires d'archéologie, d'epigraphie et d'histoire,' which originally appeared in various periodicals and transactions; the volume is appropriately dedicated to the distinguished epigraphist Waddington. The essays are twelve in number, classified as indicated in the title, and illustrated, where necessary, with excellent lithographs. Thus it contains, in the first part, several interesting plates illustrating works of art, especially paintings found at Rome in the recent excavations on the Palatine. We are especially struck with a painting of Polyphemus and Galatea, and the view of a street in Rome. The epigraphic portion contains some hitherto unedited Greek inscriptions, coming from Asia Minor and Thrace. The historical essays also have reference to the East—Disappearance of the Gallic Language in Galatia, Campaign of Cæsar against Pharnaces, Popular Superstitions of the Modern Greeks, and Commerce in Money at Athens. This last is a very interesting sketch of the trade of money-dealers at Athens, who are shown to have anticipated in many respects the money processes of modern times; for instance, in the freedom of the rate of interest, in the use of bills of exchange, and even of checks and endorsement. The history of a leading banking-house is sketched from data furnished by the oration of Isocrates against Pasion (*Trapezitica*) and that of Demosthenes for Phormio.

## CHARLES EDWARD.*

WHAT was the true character of the last Stuart who fought for the Crown of England? Poetry and sentiment have painted him as the last of the heroes of chivalry, and the facts of history at first sight bear out the legend of romance. When a youth of twenty-five, he came with scarcely a follower to a land which he had never seen, and where he might instantly have been betrayed into the hands of his foes. He rallied round him a few clans of half-armed Highlanders. With a force which at no time amounted to 10,000 men, he overran Scotland, he occupied Edinburgh, he defeated in one battle after another the trained soldiers of Great Britain. He marched into the midst of England without meeting the slightest opposition. He retreated because the courage of his followers would not support his daring proposal to advance on London. Even in retreat he repelled the only force which dared to molest his victorious Highlanders. In Scotland, he again vanquished his foes in regular battle; and when hunger, fatigue, and want, rather than the prowess of his opponents, had worn down his army, he still rallied for a last desperate effort on the field of Culloden. After defeat, the heroic fidelity of his followers and the perils of his escape cast round him a halo of romance. The imagination of sympathetic contemporaries was touched by the dramatic incidents of the Prince's career. "For what wise end," writes the journalist of the escape, "heaven has thus disappointed and yet preserved this noble Prince, and what future scenes the history of his life may display, time only can tell, yet something very remarkable still seems awaiting him and this poor country also"; and all Paris, which, not quite fifty years later, went mad with republican hatred of kings and tyrants, greeted with enthusiastic applause the young hero who had fought and nearly conquered on behalf of the divine right of monarchs. Posterity, moreover, which is supposed to be an impartial and infallible judge of men and their deeds, has, with easy credulity, adopted the Jacobite view of the career and character of the last idol of Jacobitism.

But, however natural it be for unreflecting sentimentalists to lavish admiration on the Charles Stuart of 1745, no one who has the slightest knowledge of history can be ignorant of the fact that the "noble Prince" who led the Highlanders to victory ended his life as a debauched sot, too contemptible to excite the fears of his rival, and too vile to retain the respect or the affection of his adherents. The contrast between the Prince who, at twenty-five, landed in the Highlands, and the wretched being who, forty years later, excited the contempt and loathing of the citizens of Florence, is the most painful and, at a first glance, the strangest which history presents. Other men have fallen away in old age from the promise or the glory of their youth. What is peculiar to the life of Charles Stuart is that he fell at once from something like greatness to a condition of degradation. In 1746, he was the idol of France. In 1748, he had not lost the hearts of the French people, but the French king and his ministers knew well that the popular hero was the most worthless of a worthless family. His empty protests against the treaty of Aix-la-Chapelle; his inability to understand the position or needs of France; his undignified resistance to the demand that he should leave the country—all show that within three years of the expedition to Scotland the young Pretender had developed the worst faults of a royal adventurer. Those who like to trace the rapidity and the depth of this fall may read what is known of his later years in Mr. Ewald's biography. It may suffice to say that Charles Stuart quarrelled with his brother and father; wore out the patience of his protectors; estranged even the sympathy of the Pope; outraged and insulted his mistress; showed callous indifference to the interests of his followers, who were prepared to risk fortune and life for his sake; treated his wife with such brutality and meanness that her flight from him was sanctioned by the approval of the Pope and of Cardinal York; and (that no disgrace might be wanting) showed in his later years that the vices of a libertine might be combined with the parsimony of a miser and the cowardice of a bully. The more the facts of the Prince's life are examined, the more perplexing seem, on a cursory view, the contradictions of his character and career.

Yet the enigma is not, we suspect, really hard of solution. The explanation given by Mr. Ewald is simple, but more simple than satisfac-

* 'The Life and Times of Prince Charles Stuart, commonly called The Young Pretender. By A. C. Ewald.' London: Chapman & Hall.

tory. Charles Stuart was, on his view, a hero till 1748, and a blackguard ever after. The terrible transformation was, he conceives, due to dipsomania; and the generous youth of 1745 sank into degradation under the influence of drink. Now, that the Prince's passion for drink, which had developed before he left Scotland, was one of the elements of his ruin, no man of common sense can doubt; and if it were necessary to grant that the royal adventurer was a man of heroic mould when he landed in Scotland, perhaps no better explanation of the darkness which surrounds his old age could be found than that adopted by Mr. Ewald. But the necessity for this explanation is removed if it can be shown that in his time of prosperity, no less than in his days of adversity, the Prince betrayed the worst features of his character. In the heyday of youth, the spoilt favorite of the Pope and the petty princes of Italy no doubt displayed a dash and vigor of which you can find but small signs in the career of the adventurer who, in later life, fatigued kings and ministers by his undignified supplications and fruitless intrigues, and it may be conceded that the loss of physical nerve was due to drink. But except dash and the possession of those superficial graces in which few of the Stuarts were deficient, the hero of 1745 seems at no time to have possessed any of the qualities of greatness. The partial success of his movement argues considerable military talents on the part of its leader, but that leader was not Charles Stuart. Sir Walter Scott cannot be called an unfriendly witness, and he testifies to the fact that the man to whose genius the victories of 1745 were due was Lord George Murray. "Charles Edward," he writes, "had not a head or heart for great things, notwithstanding his daring adventure; and the Irish officers by whom he was guided were poor creatures. Lord George Murray was the soul of the undertaking." This is the dictum of a man inclined by every prejudice to overrate the merits and gloss over the defects of all the Stuarts. It is further borne out by contemporary evidence. "Had Prince Charles slept during the whole expedition," says the Chevalier Johnstone in a passage cited by Lockhart, "and allowed Lord George Murray to act for him according to his own judgment, there is every reason for supposing that he would have found the Crown of Great Britain on his head when he awoke." Fortunately for Great Britain, Prince Charles had the "head" of a Stuart: he could neither devise great things himself nor appreciate the greatness of others. Throughout the whole of the expedition he suspected and thwarted Lord George Murray, whilst he looked with childish trust and favor on Murray of Broughton, who ultimately betrayed his associates, as he doubtless would have betrayed his Prince, in order to preserve his own miserable life.

With Prince Charles, again, as with all the Stuarts, the faults of his head were intimately connected with the meanness of his heart. From the moment of the retreat from Derby, he showed that he had none of the strength which bears up against adversity. He sulked, he refused to consult others, he followed the suggestions either of favorites or of his own mind. Every step taken was a mistake, and for each mistake the Prince was responsible. Nor were his errors redeemed by his valor. Whether he was really wanting in courage or not must always remain open to doubt. It is certainly strange that he, like three at least of his ancestors, should have left it open to doubt whether, after throwing away the lives of others, he was not chary of risking his own. The fidelity of the Highlanders gives an impression (which is erroneous) that the Prince gained the affection of those who knew him. The men who stood nearest to him neither loved nor admired him. He had, it may be supposed, a captivating manner, but in the qualities of his heart and mind he was a true Stuart—that is, a man of cold feelings and narrow intellect. When he exhibited at once his stupidity and his brutality by refusing to dismiss a mistress whom he disliked in order to save the lives of followers to whom he owed everything, an indignant Jacobite asked a question which must rise in the mind of every one who reads the life of the last Stuart who claimed to be King of England, "What has your family done to draw down the vengeance of heaven on every branch of it through so many ages?" Nor is the answer hard to find: the family, with rare consistency, pursued an undeviating course of shortsighted selfishness. What was true of the family was true of Prince Charles. Their vices were his vices, and the ruin of the man was like the ruin of his race.

---

*History of the Civil War in America.* By the Comte de Paris. Translated, with the approval of the author, by Louis F. Tasistro. Edited by Henry F. Coppée, LL.D. Vol. I. (Philadelphia: Joseph H. Coates & Co. 1875.)—This volume comprises the first two volumes of the original, and as the latter were noticed at length in the *Nation* of January 28, 1875, it will only be necessary here to speak of the merits of the translation itself. This has been done by Mr. Tasistro, formerly a translator in the State Department at Washington, and it is edited by Professor Henry Coppée, who is more or less widely known as an ex-army officer and instructor at West Point, and lately president of the Lehigh University. The editor's part in the work seems to have been very slight; he has twelve small foot-notes on matters of little or no consequence, and the few errors which crept into the original seem to have escaped him. As an example of typographical errors: on p. 164, Acquia Creek is said to be on the *left* bank of the Potomac; of small errors of fact, on p. 23, we learn that the President is entitled to dismiss an officer of the army whenever he pleases. Again, on p. 182, the author gropes rather blindly among the statistics of census and emigration to discover the percentage of foreigners and native-born citizens in the volunteer army, deducing as his result that about two-thirds of the army were natives. The editor might have helped him here by quoting the table from the Adjutant-General's report for 1865, which gives the total numbers and exact percentage of each nationality; the percentage of natives was 75.48. The translation is free and flowing; perhaps it would have been more vigorous and forcible had it been more literal; but, on the whole, it is very good. Only in pure technicalities is the translator occasionally at fault. For instance, in the original, speaking of the labors of the Commissary Department, the author says: "Il n'y a pas de non-valeurs pour le commissaire aux vivres." *Non-valeurs* is translated "dead-heads," which is hardly an improvement on its literal meaning of non-combatants. Again, on p. 307, we find this very blind sentence: "Thus . . . they *saved* this ball a degree of velocity only one-half less than the amount it would have *required* if fired from the Armstrong gun." The original is plain enough, and reads: "Ainsi . . . ils *obtenaient* pour ce boulet une vitesse qui n'était que de la moitié inférieure à celle que lui aurait *donnée* cette dernière pièce." Of the fourteen maps which accompany the original, the publishers have reproduced only six In this we think they have erred, and that they should have added at least the map of Virginia and Maryland, and that of Kentucky and Tennessee The general plan of operations is incomprehensible without them, and good maps of the States for military readers are not so easily procurable as the editor intimates. The maps which have been reproduced, however, are admirable. Of the print, paper, and binding of the book we cannot speak too highly, and its cost is less than half that of the original, including duties. This work was written principally for European readers; but we advise all Americans to read it carefully and judge for themselves if "the future historian of our war," of whom we have heard so much, be not already arrived in the Comte de Paris.

---

*Money, and the Mechanism of Exchange.* By W. S. Jevons. (New York: D. Appleton & Co.)—This book is not, as might be supposed from the direction which the studies of the author have already taken, a treatise on the science of currency and exchange, but is rather a descriptive one, embodying what we might call the natural history of the subject. The largest part of the work is taken up with a description of the numerous articles which have served the purpose of money in past ages, accompanied by a commentary on their respective merits. He touches but lightly on the modern theory of the subject, because that has already been discussed by Mr. Bagehot in his volume on Lombard Street and the money market Mr. Jevons's work must, on the whole, be considered as one of great value, as giving very full information on a subject of which, considering its importance, very little is generally known. The small space which, for the reason just given, is devoted to the theory of the subject, renders extended criticism unnecessary, but we cannot help noticing the disproportionate attention bestowed on the money of the past. The cattle and leather money of ancient times is described and discussed with great detail; one section is occupied with the attempt of the Russian Government to coin platinum, which was abandoned some time ago; while the present irredeemable paper currencies of Austria, Russia, and Italy are disposed of with the simple allusion to their existence. Considering the great want in this country at the present time of exact information respecting the working of these currencies and the policies of the respective governments in regard to them, we cannot but regret this omission. Several disconnected paragraphs relate to the paper currency of this country, which the author seems to have studied with much care. We must, however, remark on his singular misapprehension of the requirement of our national banking law, that a reserve of twenty-five per cent. shall be kept up. He seems to think that this requires the banks to suspend even the redemption of their own notes when the reserve falls below this point—a *bêtise* which we fondly hope is below our national Congress. The work being limited to the subject of the "mechanism" of exchange, the reader who takes it up expecting to find anything especially suggestive in it will be disappointed. We must, however, except the chapter on a "tabular" standard of value, which, if human nature were a little more perfect than

it is, both intellectually and morally, would soon force itself into recognition whenever obligations were incurred to pay money at a very distant interval. The principle on which this proposed standard is based is this: there is no commodity whatever the absolute value of which can be considered as invariable during long intervals. Measured by its average purchasing power, the value of gold itself is subject to slow changes. Hence when one agrees to pay a hundred gold dollars fifty years hence there is some uncertainty as to what the averaging purchasing power of those dollars would be. But if, instead of taking a certain quantity of gold, the agreement should be to deliver certain specified amounts of a large number of the products of labor, such as wheat, coal, beef, bricks, cloth, etc., the uncertainty as to the absolute value of the consideration to be received would be greatly diminished. If, at the time of payment, the gold value of the sum total of the products were greater than at present, it would show that the absolute value of gold had diminished, and *vice versâ*. Although the difficulties in the way of bringing such a standard into practical use in the present condition of society are too obvious to render any mention of them necessary, yet the system is worthy of careful study, as giving a clear idea of what a standard of value should be.

*Norse Mythology*; or, The Religion of our Forefathers. Containing all the Myths of the Eddas, systematized and interpreted, with an Introduction, Vocabulary, and Index. By R. B. Anderson, A.M. (Chicago: S. C. Griggs & Co. 1875. 12mo, pp. 473.)—It is quite the fashion nowadays to find fault with the way in which we are brought up, and with the kind of knowledge which is put into our heads in early life. From beginning to end, our education has come to be a favorite subject for criticism. We have studied the things we ought not to have studied, it is said, and have been kept in ignorance of topics with which we ought to be familiar. And so, among other things, it is not unfrequently remarked as singular that we, who are supposed to be the descendants of Teutonic heathens, should know next to nothing about the religion of our own forefathers, while the foreign phrases belonging to Greek and Roman heathendom are household words among us. Every schoolboy knows something about Herakles, and Cerberus, and the gardens of the Hesperides, and any popular orator is capable of making allusions to Achilles or Helen, while the very names of Thor and Fenris-wolf, or the apples of Idun, are known only to scholars, and the legend of Sigurd and Brynhild, even when presented on the stage with all the genius of Janauschek, was thought to be too strange and outlandish to interest the public. While the fact is undoubtedly so, there is nothing in the explanation of it so difficult as to require any special comment. However Teutonic we may be in direct ancestry (and it is an open question whether we are not quite as much Celtic as Teutonic), there is no doubt that all our higher culture, including our religion and religious traditions, has been got from our long association with the Roman Empire. The scientific, philosophic, and artistic work of Greece, and the religious and ethical work of Judæa, made an integral part of that all-comprehensive work known as Roman civilization—a work in which all Celtic and Teutonic Europe was gradually led to take part, so that what we call "Christendom" is but another name for the "Roman World" with the character of its "imperium" enlarged and modified. Whatever may be our physical pedigree, we are spiritually the descendants of the Hellenized and Hebraized Roman; and in retaining the traditional recollection of his heathen notions, and of their supplanting by Judaic Christianity, we are simply keeping up a natural and continuous historical tradition; and the shape which our classical education has taken is but one of the ways in which we have sought to preserve this historic continuity of tradition. What the followers of Hengist and Horsa may have believed about Balder and Wodan, as well as what was taught and sung by Druidic bards before the arrival of the Teuton in England, is of real interest to us; but it is naturally an interest of an antiquarian and scholarly sort, since both these groups of beliefs were long ago quite discarded by our ancestors. They did not enter into the stream of Roman culture, and ceased to have any future before them from the time when England became Christian. They have survived in a fragmentary way, in a number of interesting sporadic superstitions and customs, but for a dozen centuries have had very little influence upon our higher and more serious thought in comparison with the immense influence exerted thereon by beliefs that bear the stamp of the Roman mint.

But while our ancestral theories of the world have been thus overgrown and superseded by theories elaborated on foreign soil, they are none the less interesting in themselves or worthy of study for their own sake. Nor would it be true to say that they have not left well-marked traces on our words and customs, if not on our thinking. The mere etymological fact that the word "God" (*Guodan*), which we use to describe the Infinite and Eternal Sustainer of the universe, is but a variant pronunciation of the word "Odin" or "Wodan" (*Guodan*), by which the Norseman personified the "all-pervading" *Storm-wind*—this mere fact (see *North American Review*, October, 1869, p. 354) ought to be enough to lead us to enquire what the Norseman thought of Odin and what attributes he ascribed to him. The fact that the mistletoe-bough under which Mr. Pickwick saluted the dowager of the house of Wardle is descended from the mistletoe by which the beloved Balder (all because of Loki's mischief) was slain in the big-boy sport of the gods of Valhalla—even this fact might well make the innumerable readers of Dickens curious about Balder and Loki.

In Prof. Anderson's book, the story of Norse mythology is well rendered, albeit with a touch of commonplace moralizing and occasional "fine-writing" which is a slight drawback to the literary merit of the work, but still is not likely to injure it with the general reader. This criticism applies more especially to the introductory portion. When we once get *in medias res*, we find that Prof. Anderson gives us an admirably methodical and lucid account of Norse ideas as embodied in the elder and younger Edda, with some assistance from later sagas, the whole being so fully illustrated with translated extracts as to leave the reader nothing to desire. The work is done, too, with creditable accuracy, and there is perhaps no other book at hand to which we would so soon refer the general reader desirous of learning something about the mythology of our forefathers.

---

*Gift-Books for Children.*—In returning once more to the juvenile literature of the season, our space warns us to be brief, and to dismiss with a word books which might pleasantly be characterized by extracts. The grand division of those which relate to the animal creation may worthily be introduced by Mrs. Trimmer's 'History of the Robins' (T. Nelson & Sons), well-known to the youthful readers of a generation ago as a gentle history told both from within the nest and without it. The book is beautifully made, and has seventy charming illustrations from designs by Giacomelli, whose delineations of birds, and especially the motion of birds, are notoriously skilful. The same house publish 'Half-Hours with the Animals: Narratives exhibiting Thought, Sympathy, and Affection in the Brute Creation'—an interesting collection, with an orthodox, anti-Darwinian reference to the first chapter in Genesis "as the only credible and the only intelligible account we have of the rise of 'the animal creation'"; 'The Land of the Lion,' or, in other words, Africa, with stories and pictures, drawn from various sources, of lions, falcons, deer, the ibis, crocodile, hippopotamus, elephant, etc., etc.; and, by the clever author of the 'Life of a Bear,' 'Goatland; a Story of Country Life,' which has many things to tell of besides goats. What distinguishes 'The History of My Friends; or, Home-Life with Animals' (G. P. Putnam's Sons) is the odd sort of pets not often associated with "home-life"—for example, an ostrich, a gazelle, and a puma, not to mention a monkey, a parrot, a mule from which even Josh Billings might learn something, dogs, cats, etc., etc. It was at Marseilles, convenient of access by sea to all tropical countries, that the fortunate little boy lived who made friends with all these strange creatures. The work is excellently translated from the French of Emile Achard, and is racy and mirthful in style. We may as well recommend here two books not specially intended for the young, but which would certainly interest intelligent boys and girls of ten to twelve and upwards—perhaps even some of their juniors. We mean Mr. Frank Buckland's 'Log-book of a Fisherman and Zoölogist' (J. B. Lippincott & Co.) and the Rev. J. G. Wood's 'Popular Natural History' (Geo. Routledge & Sons). Mr. Buckland's gossip covers a multitude of subjects, though he is perhaps most at home when in sight of salt-water. He discovers that Landseer "purposely introduced 'his favorite bit of red' into nearly all his pictures"; visits in a sympathizing spirit the exhibitions outside the cattle-show; gives the biography of an old man-of-war's man; describes a dinner of horseflesh and another of American game—the only chapter in which we have noticed him prefer "negroes" to "niggers"; tells of divers and their adventures, of the Brighton aquarium, of the Scotch red-deer, the wolves, the fur-seal, his monkeys, the "bore" on the Severn; and throughout is chatty and entertaining. The pictures in Mr. Wood's 'Natural History' will attract youngsters of uncertain age, and the older they are and the better they can read, the more they will dip into the text, and they will find the greater part of it not difficult to understand. The arrangement is systematic.

Of made-up books we give the first place to Mr. Stockton's 'Tales Out of School' (Scribner, Armstrong & Co.), which will be sufficiently described and commended to many of our readers when we say that it is another

'Roundabout Rambles.' It is an inexhaustible fund of amusement and instruction, and, besides its home uses, would make a capital prize-book for country schools; and a tired teacher, armed with it, might convert a dull day into a perfectly delightful occasion. Mr. Stockton has, we think, somewhat departed from his plan in combining plates borrowed from different sources to illustrate a single narrative; the overcrowded adventures of "Col. Myles" might better have been distributed among the real heroes of them—*e.g.*, Sir Samuel Baker. Is there any reason why they should not have a celebrity among children? 'The Golden Harp Album' (Geo. Routledge & Sons) contains many pretty pieces, especially the prose selections, but the collection as a whole is of mixed merit. For its morality and theology, it will compare favorably with Sunday-school literature.

Mr. Knatchbull-Hugessen, M.P., does not change his spots, and we need only refer to the illustration, facing p. 33, of the crone and hag in mortal combat, for an index to the spirit of his latest child's story, 'Higgledy-Piggledy' (Macmillan & Co.) In the 'Adventures of Johnny Ironsides,' from the French of J. Girardin (Routledge), we have a not altogether edifying sensational story of the late war between France and Germany, of which the hero is an English boy who takes sides with the French, and who, in the true Anglomaniac spirit, is endowed by the author with all the muscular virtues. The Prussian invader is, of course, burlesqued on every possible occasion. A very pretty fairy story is Rosa Mulholland's 'Puck and Blossom' (Pott, Young & Co.), and its six illustrations in gold and colors are very taking novelties. In the same manner are illustrated the 'Cruise of the Acorn,' by Alice Jerrold—a performance that falls below the expectations raised by the author's name—and 'Malcomb Manor,' a love-story with quite too much romance and false sentiment in it to make it wholesome for the "youths and misses" of sweet sixteen. From the same firm we have 'The House that Jack Built,' grotesquely illustrated in flat colors, a style that we should like to meet with oftener; the travesty seems to us rather strained, but, of course, it is meant for the youngest readers. Of 'Roddy's Reality,' by Helen Kendrick Johnson (G. P. Putnam's Sons), it is only necessary to say that the writer belongs to the school of Miss Alcott. Her talents, and she is undeniably clever, seem to us quite thrown away in work of this character.

A separate paragraph is due to Mr. Francis Turner Palgrave's 'Children's Treasury of English Song' (Macmillan & Co.) In this field the compiler's taste is well known to be unexceptionable. He has had in view children of nine or ten and those of fifteen or sixteen years of age, and has divided his work into two parts accordingly. The selections are mainly lyrical and of a high order, and any one will be glad to own in this dainty shape the masterpieces of the older and the modern English poets. Into their reverend company Mr. Palgrave admits Bryant and Longfellow, but no other Americans. Foot-notes explain difficult or obselete words, and at the end are notes historical and critical and a chronological list of authors.

*** Publishers will confer a favor by always marking the price of their books on the wrapper.*

## The Week.

THE Senate has been occupied with the discussion of a resolution, introduced by Senator Morton a week ago yesterday, calling for a special committee to investigate the recent Mississippi election; and the re-election of Mr. Ferry as President *pro tem.* The grounds on which the special committee is demanded are fraud and intimidation, the chief evidence being the unusual majority by which the State was carried, and alleged violation of the Enforcement Act. Mr. Morton declined to discuss any constitutional question involved, but referred to the special investigating committee in the Louisiana case as a sufficient precedent. On Friday, Senator Edmunds introduced a resolution that the Senate should, on the 7th of January, proceed to the election of a President *pro tem.* The motion was referred to the Judiciary Committee, this action then reconsidered, and it was finally referred to the Committee on Privileges and Elections. Mr. Edmunds, in introducing it, said that in his own mind he had no doubt that Senator Ferry was already President *pro tem.* under the Constitution, but, that all doubts might be set at rest, he was in favor of action being taken. Saturday Congress passed in Philadelphia with the President and other officers of the Government, including the Chief-Justice of the Supreme Court, inspecting the Centennial grounds and buildings, and making up their minds whether the Centennial ought to have a million and a half as a subsidy. On Monday, the credentials of Robert H. Marr as McEnery Senator from Louisiana, vice W. L. McMillan, resigned, were presented—a fact which seems to show a very obstinate determination on the part of a few malcontents to reopen the Louisiana question. Mr. Edmunds introduced a new resolution declaring Senator Ferry President *pro tem.* until January 7, or a fresh appointment, and Senator Bayard introduced a substitute in favor of Senator Thurman. The substitute was rejected by a strict party vote (21 to 24), and Mr. Edmunds's resolution adopted.

---

The House has begun its work by adopting a resolution introduced by Mr. Holman, of Indiana, against any grant of "subsidies in money, bonds, public lands, endorsements, or by pledge of the public credit, to associations or corporations engaged or proposing to engage in public or private enterprises," and expressing the sense of the House as in favor of limiting all appropriations to such amounts as shall be "imperatively demanded by the public service." The resolution was adopted by a yea-and-nay vote of 223 to 33, Mr. Holman previously explaining that the resolution did not necessarily cover the Centennial. On the same day (Wednesday week) an anti-third-term resolution was carried through by a vote of 232 to 17. Almost no other business of any kind was transacted till Monday, when the House committees were announced by Mr. Kerr. With regard to these, the Democrats are not thoroughly pleased with them, and the Republicans manage to extract some satisfaction from the Democratic soreness. It is only fair to say, however, that Mr. Kerr had a task before him which it was impossible for any man, however conscientious, with the materials at his command, to perform in a way thoroughly to satisfy himself or anybody else. The fact is that no Speaker can appoint "truly good" committees until the people elect a "truly good" Congress, and this they have never yet shown much inclination to do. In the first place, a majority of Congress is often composed of new, raw men of whom nothing is known, and the rest is made up largely of old men of whom a great deal too much is known. A curious instance of this is afforded by the case of Mr. Wood. Everybody knows that Fernando Wood not only ought not to be chairman of an important committee, but ought not to be in Congress at all; but Mr. Wood is a veteran Democrat and a veteran politician, lately one of the chief candidates for the Speakership; and it was only at a great sacrifice of party interest to principle, and the risk of a feud within the party which might cost it a Presidential election, that Mr. Kerr has been able to keep Mr. Wood from being chairman of the Committee of Ways and Means and actually leader of the House. The chairman of this committee, Mr. Morrison, has his parliamentary reputation to make, but is a hard-money man and bears a good character in other respects. Mr. Randall gets the Committee on Appropriations, Mr. Cox that on Banking and Currency, and Mr. Swann, of Maryland, that on Foreign Affairs. Most of the names on the other committees are those of obscure or unknown men, largely taken from the South, and afford no guarantee as to the sort of legislation that will be attempted by them. The general complexion of the financial and commercial ones, however, is strongly for hard-money and a tariff for revenue.

---

The overwhelming majority by which, on Wednesday, the House declared against a third term of course gives another blow to that scheme, and yet we have no doubt it will be still talked of, and by many dreaded, in spite of the hostility with which it is received in every direction. It has been asked, and not without good excuse, why, if a third term is impossible, and if people are so sure to vote against it, should it be so much discussed and protested against by Republican papers? The answer is very simple. No distinct and unconditional refusal of a third term has come from General Grant himself, and the "Senatorial Group," as *Harper's Weekly* calls the knot of senators who have for the last four or five years managed the party, either keep dead silence about it or seem to be busy in creating a contingency which would make the re-election of General Grant seem necessary. Republicans, therefore, who fear above all things being forced to vote for a Democratic candidate, are uneasy about the turn things may take in the Republican Convention. They know well that the President and the Senatorial Group will have a great deal more to do with the selection of delegates than the mass of Republican voters, and they fear that on the last day of the sitting, after a "ringing speech" from some leading "worker" about "outrages" or the Pope or the currency, a sort of afflatus may seem to pass over the postmasters and collectors and inspectors and appraisers and supervisors, and they may rise in their seats as if inspired, and with one voice nominate Ulysses S. Grant for a third term, and that, at the same moment, a mighty curtain may be rolled back on the stage, as if by an invisible hand, and the portrait of the Presidential candidate be revealed to the multitude, surrounded by specie and monogamous husbands, with the Pope in the background moving away at a smart trot from a crowded school-house, followed by a herd of terror-stricken polygamists, repudiators, and secessionists. There is nothing at all improbable about such a *coup* as this; and, if it were once executed, good Republicans would find themselves in a very awkward position. They might either be compelled to vote for a third term, or to cast about at the eleventh hour for a bolters' candidate, and, if they found one, run the risk in supporting him of electing a Democrat. They are, therefore, now hammering away, not so much to convince the public as to convince the President and frighten the office-holders.

---

The visit of Congress to Philadelphia and the attitude of the press both point to the appropriation of the million and a half asked for by the managers of the Centennial to carry them on to the opening. There is now as little objection to this request being granted as there could well be in an affair of this kind. When they first went before Congress there was great danger, apart from all questions of propriety, of the Centennial getting into "politics," and an appropriation by Congress at that time would have been a pretty certain means of securing this unfortunate result. The v te

would have been brought about by all sorts of secret bargains and promises, and every corrupt man in Congress who had voted for it would have thereafter counted himself as having the right to make something out of it. Even if the managers had been able to keep control, suspicion would not have been allayed, and fraud and perjury would have been charged at every turn against all concerned. The vote of the House against subsidies will now effectually prevent any unpleasantness of this sort, for there can be little or no log-rolling and wire-pulling in the matter. Besides this, the Centennial promises now to be more cosmopolitan and much more successful than it did at first, and it is important that the Government, which is at once an exhibitor and a promoter of the enterprise, should not suffer the representatives of the effete despotisms who are coming over here to feel that their monarchical shows have been better than our simple Republican exhibition.

Less than eighteen months ago, Senator Morton was engaged in a public attempt to extenuate the political demoralization of South Carolina, and to clear the Republican party of all responsibility for it. At about the same time, the Administration, beginning to feel the incubus of this pet Republican Southern State, was sending down hints to get rid of Governor F. J. Moses by impeaching him. This was after the failure to get Moses tried for grand larceny, his defence being that a governor of the State could not be indicted before he had been impeached. Shortly after that he lost a renomination, and was succeeded by Chamberlain, and the general impression was that reform had been begun, if not already achieved, "within the party." It very soon became evident, however, that the legislature had not been included in the reform, and that the greatest service the new governor could render the State was to watch all its proceedings and veto what he could of them. He had enough influence with them last winter to prevent their appointing the notorious W. J. Whipper to a vacant judgeship in the Charleston district, and his appeal to them to preserve the party from such a disgrace really seemed to have some weight with the Assembly. They have grown wiser, however, in the interval, and on Thursday, by a "strict party vote" and on strict party grounds, actually elected Whipper to the identical judgeship—the most important in the State—and ex-Governor Moses to an adjoining circuit, the third. Whipper is a black man, a politician of the lowest order of morals and intelligence, and shares with Moses the reputation of having been an embezzler of State moneys. The latter not only robbed the Treasury, but, as Governor, abused the pardoning power in a way which has never been surpassed for cool defiance of justice and unconcealed personal ends. Judges at last refused to go through the farce of giving long sentences to condemned criminals, and in his court suitors would doubtless soon learn the folly of paying counsel instead of bribing the bench. Governor Chamberlain has once more effectively thrown himself in the breach, by refusing to issue commissions to these worthies, on the ground that before their appointments take effect (next August) a general election for the Assembly will be held, and that the new legislature is the proper body to fill the judicial vacancies of 1876.

The Mayoralty election in the city of Boston last week was attended by several unusual circumstances. Mr. Boardman, the defeated candidate, is President of the Common Council, and is so popular a politician that he managed to secure the nomination of both the Republican and the Democratic party, of the Labor Reform organization, and of several minor bodies. Mayor Cobb, on the other hand, was unable to secure the formal nomination of any regular party, and was nominated only by a self-constituted committee of Silver-Tops and Swallow-Tails. Moreover, he had alienated the affections of the workingmen by refusing to use his influence to keep up the wages of city laborers when the market price of labor had declined; he was deserted by all the engineers of party machinery because, throughout his term of office, he has persistently refused to enquire into a man's political beliefs when determining qualifications for official appointment; he has also urged the adoption of the proposed new city charter, which would take a great deal of executive power from Aldermanic Committees and place it in the hands of commissioners appointed by the Mayor. In spite of all these adverse circumstances, his election, by a decided majority of the largest vote ever cast at a Boston city election, is an encouraging sign of healthy political action. It is a significant fact in this connection that the Board of Registrars of Voters removed no less than 17,000 names of voters which were upon the lists last year, leaving about 40,000 names of *qualified* voters. According to Massachusetts law every voter must be able to read and write, and is obliged to produce a receipted tax-bill, before his name can be registered. Whether Mr. Cobb, whose majority was 2,600, would have been defeated or not if the above 17,000 names had been left upon the voting-lists, is a problem which may deserve to attract some attention from those interested in the question of municipal politics. Mr. Boardman, it is proper to add, although supported by all the regular parties, was opposed by the entire press of the city.

We observe that the Bar Association of this city is going to become a State organization—a proceeding in which its members of course are chiefly interested. The success of the Bar Association throughout the State as a reformatory agency—a matter in which all have some interest—will depend upon the vigor with which it goes to work, and we wish we could say that the parent society had latterly shown a zeal sufficient to make us expect great things from the branches in the rural districts. Why does not the Bar Association, for instance, in this city, investigate such proceedings as those in Dolan's case? Dolan has been sentenced to be hung by one judge after a trial, whereupon another judge who knows nothing about the case intervenes, and on the simple statement "on honor" of a lawyer who had no connection with the case grants a writ of error, and no notice required by statute is even sent to the District-Attorney by the lawyer. These are the things that Barnard and Cardozo used to do. Judge Donohue, who granted this application without hearing the other side or enquiring whether notice had been given, is the same Judge Donohue who ordered a "bill of particulars" to be given in Tweed's case, it being impossible for the plaintiffs to give a bill of particulars owing to the destruction of the records on which the action was based.

Mr. Trenor W. Park does not seem to be satisfied with his suit against the *Tribune*. He has brought one against the *Nation* also, and again lays his damages at $100,000. What it is for we do not as yet know, as he has not filed his declaration, and we can think of nothing which has recently appeared in our columns likely to give him offence, except our call on James E. Lyon to "come to the front." It is not unreasonable to suppose that when General Schenck comes home he will sue us also, and he cannot, as a man who has filled a first-class mission, decently lay his damages at less than $200,000. This will make $300,000 in all, which, with $25,000 to Mr. Silas Williams, we shall have to pay to the promoters of the Emma Mine without ever having made a cent out of it ourselves. We would ask respectfully whether this is fair or just? We will take leave to add, however, that we think Mr. Park's allegation that we have damaged him to such an extent the most shocking illustration of the effect of inflation in prices we have yet witnessed. We feel confident that, were things now on a specie basis, a reputation like his could be repaired and made as good as new for $50 in gold. If anything we have said of it has injured it to the extent of $100,000 in paper, it shows how much contraction is needed before we "touch bottom." There is no doubt that after January 1, 1879, if the Government carries out its promises, Emma-Mine operators may be freely libelled for $25 a head, without costs. As Mr. Park's suit with the *Tribune* will come on before ours, we fear ours will prove uninteresting and short.

The changes most deserving of notice in Wall Street during the week were the decline in gold, the advance in foreign exchange, and the advance in the rates for money. The expectation of the early beginning of the prepayment, without rebate, of the January interest on the public debt, which was backed up by speculative

influences in the Gold-Room, was the immediate cause of the decline in the gold market; the remote cause was the appointment of committees in the House of Representatives in favor of a sound currency. Foreign exchange was strong, because of a demand to cover not only the collections of January interest due to Europe but to pay for United States bonds imported from there, the New York market for these securities having ruled above the English and German markets. Besides this, the supply of exchange was almost restricted to bills made against the shipment of cotton. The cotton movement continues active, and both receipts at the ports and shipments are unusually large; but with this as the only source for bills, the supply has fallen behind the demand. Grain cannot be exported, because there are several speculative combinations which are interested in keeping the price up, the result being that this market is higher than the foreign markets. It is estimated that fully 10,000,000 bushels of wheat are held at this port by the combination or clique which has undertaken to control the supply of No. 1 wheat, on the calculation that the proportion of No. 1 wheat to the remainder of the crop is so small that in time there must be a very high price for it. Thus far this calculation has been at fault, and the exchanges as between here and Europe have been deranged. The money market is now fully 7 per cent. for demand loans, and it promises to continue so into the new year. The New York banks hold $7,000,000 surplus reserve, and any change until the second or third week in January, when currency will begin to come back from the West, will be a reduction. At the Stock Exchange speculation has been dormant. The best class of railroad investments, like the first mortgages of old roads, were never higher—New York Central currency 7s, a type of this class, having reached 125. If the United States Supreme Court decides in favor of the railroads in the Granger cases, on which decision will be rendered in January, railroad property will, without doubt, be held in higher estimation by investors than it has been since it was first attacked by the Grangers. The gold price of $100 greenbacks has ranged during the week between $87 33½ and $88 30.

General Webb's case has come up in the United States District Court, but the important facts have not yet come out. In 1867, when Minister to Brazil, he received £14,252 from the Brazilian Government on account of a claim made by the United States for the illegal seizure and condemnation of the schooner *Caroline*. Of this sum £5,000 was turned into the Treasury by General Webb, the balance, £9,252, having, he maintains, been paid to "influential Brazilians" for services rendered in the settlement of the claim. General Webb says now that payment was made in ninety-day bills on London, and that he has "no doubt" that they were for £5,000, £5,900, and £3,352 respectively; that the £5,000 bill was transmitted by him to Mr. Seward; that he paid over to "certain Brazilians," whose names he is "not at liberty to mention," but who were designated by the claimant, Lemuel Wells, the other two bills, and enclosed a statement of the facts with the names erased to Mr. Seward. Further than this he declines to answer any questions. He received a reply, however, from Mr. Seward, complimenting him on the settlement.

The purchase of the shares in the Suez Canal by England seems to excite more interest in France than in any other country out of England, and forms the most prominent topic of discussion in all the Paris papers. The first feeling excited by the news was one of intense chagrin, and some of the extreme Radical papers have called on the Ministers to acknowledge their miscarriage by resigning. The publication of the diplomatic correspondence on the subject, however, in the new Yellow Book has done much to soothe popular discontent, for it shows that while the British Government has been long made uneasy by the fact that the ownership of the Canal was chiefly French, it is now, speaking through Lord Derby, perfectly willing that the Canal should pass under the joint management of a Commission of the maritime powers, if such could be created. M. Lesseps has issued a circular to the stockholders assuring them that what has happened has only brought about the state of things for which he vainly labored in the beginning, namely, a fair representation of British capital in the proprietorship of the Canal, and he evidently regards the transfer of the Khedive's shares as adding to the value of the others. There is already an increased market demand for them, mainly, it is said, from British investors. The essay-writers in the Paris papers treat the purchase as possessing a profound political significance. It indicates, they think, an abandonment of the policy of non-intervention, and preparation for a more aggressive attitude in Continental politics.

In England, the general satisfaction over the purchase of the Suez Canal shares is considerably dampened by the multiplying evidences of the unsatisfactory condition of the navy. The *Iron Duke*, which sunk the *Vanguard*, has herself come near sinking, just outside the harbor, from derangement of the valves, which was only discovered and comprehended at the last moment, and the *Monarch* has been running into a merchant vessel in broad daylight. The public has begun to enquire savagely whether the officers of the fleet are fit to manage the new iron-clads, and, nervously, whether it is well to build so many of these delicate monsters. The Admiralty has, since its conduct in the *Vanguard* affair and its failure to bring Prince Leiningen and Captain Welch of the Queen's yacht before a court-martial, and its issue of the ridiculous fugitive-slave proclamation, to bear a double share of the blame of everything that goes wrong, and it is lucky for them that Parliament is not sitting. The Prince of Wales's visit to India has thus far proved a great success. There has been a very respectable amount of enthusiasm and good weather, and the native princes have, on the whole, behaved very well.

The Turkish troubles are still the main question of European politics, but there is little that is new about them. The probability of Austrian interference, of which we have spoken in an article elsewhere, grows steadily. The number of Montenegrins who are reinforcing the insurgents increases, and the Prince excuses himself for letting them go by pleading the inability of his territory to support both the refugees from Herzegovina and his own fighting men. If he has to feed the wives and children of the insurgents he can only do it by letting his own able-bodied subjects cross the line. The Austrian Government, in the meantime, finding that dealing out rations to the insurgents on her soil was enormously increasing their numbers, has proclaimed a commutation for a round sum in money. At Berlin the talk in the higher circles is that the difficulty will be settled peaceably, and the same story is told at St. Petersburg; but the general belief is that it is based on the hypothesis that when the moment comes to intervene, the Porte will not resist. All signs, in short, point to an Austrian occupation of Herzegovina in the spring.

The horrible story which came from Bremen that Thomas, the owner of the infernal machine which exploded on the wharf, was going to ship it, and that it was to blow up by clockwork when the vessel had been a certain number of days at sea, so as to secure him a heavy amount of insurance, has not been confirmed in any way. No trace of any such insurance has been discovered, and it is time to ask whether the unfortunate wretch was not a lunatic, and the story of his motive an invention. It is, of course, very likely he was going to ship the explosive material, but this a lunatic might do, or plan doing, while the arrangement of the insurance would have required a persistence and foresight of which an unsound mind would hardly be capable. In fact, no sign of adequate motive has been discovered. The suicide, too, remains to be accounted for. Anybody capable of entering on the diabolical enterprise of blowing up a passenger vessel at sea would hardly suffer much remorse from seeing his machine go off prematurely on a crowded wharf, or be so chagrined by the commercial miscarriage as to kill himself if sane. The examination of his accomplices, or of the persons he employed, ought, however, to throw full light on the matter. Travellers, at least, will be greatly relieved if it should prove a case of insane self-accusation.

## "HARD WINTERS" IN POLITICS.

BOSTON has just had an experience in municipal government by no means unlike that with which New York is now so familiar. We shall not go into its details here, and have given the main facts of it in another column. It is enough to say that, after two or three years' trial of honest government under just the kind of Mayor that municipal reformers are constantly sighing for, the politicians got tired of the experiment, and the Republicans, as they have more than once done in New York, combined with a portion of the Democrats to prevent his re-election, to do away with the commissions by which a portion of the administration is honestly and efficiently executed, and to introduce a régime in which the city funds would be liberally expended in all ways, but above all in the employment of labor for the mere purpose of charitable relief, and without regard either to the needs of the city or the capacity of the taxpayers. Some of the manifestoes issued by the coalition were declarations of communism, of the right of the poor to live on the rich and well-to-do, as pure as ever issued from Belleville. The movement was defeated by a small majority of about 2,600 in a vote of 27,000, and after tremendous exertions on the part of the more intelligent and honest classes. The appeals made to them by the press to "uprise" and "strike for their homes and altars" were as solemn and pathetic as were ever addressed to men about to fight a decisive battle in actual warfare, though not accompanied by the gross vituperation which forms so marked and so amusing a feature of municipal contests in New York; and the excitement in the city was greater than has been witnessed since the war. It was probably saved from capture and ransom by the enforcement of the constitutional requirement that the voter shall produce a receipted bill for his poll-tax, and be able to read and write in order to secure registry. This shut out 17,000 able-bodied citizens from the exercise of the franchise, and in all probability saved "the property-holders and substantial men."

The result is of course gratifying. All modes of escape from imminent danger are welcome, and there is no question that the safety of our great cities from legalized sack in the form of high wages and profuse charity, lies and must always lie in the presence of a majority opposed to schemes of spoliation. No arrangement of municipal government which now seems practical will deliver any American community from the necessity of being able to beat the Short-Hairs at the polls in a mere count of noses. But then, to procure real and permanent security, the majority of the taxpayers over the non-taxpayers would have to be large enough to allow for divisions in the ranks of the former over extra-municipal questions, and nothing but extraordinary care and foresight will ever make or keep it so. This care and foresight it is not a whit too soon for all the great cities to begin to display. In spite of all that one reads in the newspapers about the evils of municipal government in our day being due to the inattention of the rich to their political duties, the editors and all other intelligent men know in their hearts that it is not true. Nobody who has any real acquaintance with these evils ever pretends in a private room to believe that if the Swallow-Tails went diligently to primary meetings all would go well. The current talk on these subjects is part of the political cant of our day, and perhaps the most mischievous and saddest part of it. It is part of the melancholy effort which has been so often made in various parts of the world to form governments not with reference to the actual society to be governed, but to an ideal society, which neither those who talk about it nor anybody else has ever seen or will ever see. The persons who expect to save American cities by driving the rich men to the primary meetings, have their heads filled with the notion that the modern city is simply a New England town with a large number of people in it; that the growth of population, and the consequent changes in the mental, moral, social, and industrial condition of the population, have brought no change in the nature of the political problems with which such a community has to deal, and they keep singing with almost touching pertinacity the old psalm in which the merchants and traders are assured that they are going to be ruined if they do not "work" in the caucuses.

The late election in Boston shows, however, the direction in which the path of safety lies. In this case, nearly all the corrupt elements in both parties had the grace to unite with the men who wanted high wages for little work, and to issue manifestoes proclaiming their aims and desires with perfect simplicity and sincerity, so that the matter in controversy was presented to the honest and industrious taxpayers in the clearest and most definite shape, without disguise or concealment. With this before their eyes, the latter were able to unite, though they had not a single party organization at their back, and to defeat the spoliators, if not signally, sufficiently. The main object to be kept in view in all charters ought, therefore, plainly to be the presentation of municipal issues in the most distinct shape; the diminution, in other words, of the number of facts, whether they be laws or ordinances or men, on which the voter has to form an opinion before voting. If anybody will give himself the trouble to examine into the working of what is called "practical politics" to-day, either in city, State, or nation, he will find all the efforts of those who live by politics directed to preventing this state of things—that is, to producing the multiplication of the subjects which the voter must understand before he can vote; the multiplication of the elections he must prepare for, of candidates he must know about, of the "charges" he must examine, and of the "records" he must study. They have been so far successful, too, that they have literally made politics an impossible pursuit, or even object of close attention, to the great body of the industrious classes of the community, who are thus forced into hiring professionals to extricate them from the more serious political perils, as the burghers often did in the Middle Ages. The general result is that we have in the States most largely engaged in commerce and manufactures a political system which may be fairly said to be suited only to communities of idle slaveholders, and absolutely unsuited to the wants of a busy people.

Another mode in which the Short-Hair forces are now being largely increased in all the large cities is worthy of the serious attention of taxpayers, both for its efficiency and its ingenuity. "The drift of population into the large cities" has now for a good many years been attracting the notice both of economists and politicians. It includes of course a great many industrious and honest people, but it also includes a large number of the shiftless, the fickle, the irresolute, and the characterless, both among those who have regular callings and those who have none. The result is that the helpless and half-criminal element in our city population is increasing steadily from year to year in cities like this. It has, therefore, now become the regular thing in New York to announce every November that we are going to have a "hard winter," and judged by the test usually applied—the number of the unemployed—every winter is "hard," and the winters grow "harder," no matter what may be the state of the currency or of trade, for the number of people who have "got no work" increases, and it is unhappily difficult or impossible to distinguish those who are really glad to be without work from those who are sorry. The provision made by charity for taking care of them—by well-directed as well as misdirected charity—also grows, and the news of it spreads all over the State and all over the Union, and operates as a steady draft on the idleness and the improvidence and dishonesty of the country districts. As all these new-comers are armed after a brief stay with the power of voting away the property of the industrious, the common councils of the great cities are becoming every year more and more appalled by the sufferings of the poor, and impressed with the necessity of providing them with sham labor, by levies on the property of the taxpayer, until, if things go on as they are going, we shall have in nearly all of them before long the germ of "national workshops," in which pauper voters will be maintained in half-idleness, to the permanent detriment of their bodies and souls, by the honest and industrious workingmen. The evil to which we are drawing attention exists already in nearly every city, and is but the narrow end of a very large wedge. Now is the time to check it peremptorily and permanently, and now is the time, too, for charitable persons who are occupying themselves with the wholesale relief of

the able-bodied poor to call to mind the monstrous social and political evils which, as has been proved by much experience, lie hidden under this form of benevolence. There is no work of charity which requires more care or courage, and there is none into which so many rash and ignorant people rush.

## THE FUTURE OF THE EASTERN QUESTION.

THE correspondent of the London *Times* has had an interview with Gen. Ignatieff, the Russian Minister at Constantinople, in which the latter conversed on the Turkish question with all the frankness which Prince Bismarck has made fashionable among diplomatists, and related among other things what he said to the Sultan in the now celebrated conversation which, about two months ago, seemed to give such a serious turn to the crisis in Herzegovina. The substance of it was that his Majesty's case was hopeless; that the only thing to be done was to reform, but reform was impossible, because it could only be carried out through equality, and equality would involve the ruin of the Ottoman Empire. In Europe there are say 4,000,000 of Mussulmans, from among whom all the Government officials are taken, and who exercise over the Christians a most oppressive and insulting social superiority. The Empire cannot be saved without the removal of this inequality, but it cannot be removed by legislation. This has been tried, and failed. The contempt of the Mussulman for the Christian and the hatred of the Christian for the Mussulman have got into the manners and traditions and even into the religion of the population, and nothing now can get them out. The Christians are naturally prevented from seeking or considering any solution of the problem, except the expulsion of the Turks, by the example of Servia, and by the sympathy of Dalmatia and Croatia and Montenegro. The Servians, they say, were at the beginning of this century worse off than they are now; they rose and expelled the Turks, and have ever since been free and happy. The Dalmatians, Croatians, and Montenegrins, too, with whom they are in daily intercourse—men of the same race, language, and religion—are living under their very eyes secure, free, and prosperous, and equal before the law. Why should a Bosnian or Bulgarian be any worse off? Everybody, therefore, is giving up in despair all consideration of a *modus vivendi*, and yet nobody has anything to say about the future, except that the Turkish rule in Europe is near its close—how near nobody ventures to guess; and nobody likes to meddle actively in the crisis, because of the terrible responsibility that would follow. Russia might, as Gen. Ignatieff points out, by merely giving the signal to the Montenegrins to take part in the fray, ensure such a revival of the insurrection as would cause its spread into Bulgaria and Roumelia, or, in other words, as would set the whole of European Turkey in a blaze, and cover that vast and fertile region with blood and fire, and possibly compel occupation by Austria or Russia, or both, in the interest of humanity. But what then? The overthrow of the Sultan's authority and the organization of some sort of Christian rule would follow as a matter of course; but no real and permanent pacification could take place without the removal of the 4,000,000 of Mussulmans now resident in Europe, and owners of large amounts of property. In all the other provinces which have thrown off the Turkish yoke—Hungary, Moldavia, Wallachia, Bessarabia, and Servia—the withdrawal of the Mussulman residents has followed as a matter of course. In Servia they emigrated because, as was acknowledged on all hands, it was morally certain they would be massacred if they stayed, and they sold their property because they knew they could not collect their rents. But then each of these cases occurred at a considerable interval from the others, and the displacement of the population in each was comparatively small. Nothing like the dislodgment of 4,000,000 of persons of all ages and sexes from their homes, followed by a forced sale of their immovables, has ever occurred in modern times, or anything approaching to it, except the expulsion of the Moors from Spain; and no such process as that would be tolerated by public opinion in our time.

To these difficulties, which are of no ordinary character, must be added the difficulty of settling who is to have Constantinople; and, taken altogether, they constitute a full and sufficient reason for the reluctance of all the Great Powers to undertake the task of reorganizing Turkey, and for the general disposition to wait and see what will turn up. The knowledge that the Powers are waiting, and that a crisis of the first magnitude in the history of the Empire has really supervened, of course gives the insurgents extraordinary encouragement, and enables them to keep the field in one way or another. They are now standing tolerably well on the defensive—that is, the troops are unable to disperse the bands, which assail small bodies with more or less success, and now and then get the best of a conflict which may fairly be called a battle. The probability is that in the spring matters will not look any better than they do now. The rebels will not have expelled the troops, and the troops will not have suppressed the rebellion, and an Austrian corps will cross the frontier and occupy Herzegovina and Bosnia, as it occupied Wallachia and Moldavia in 1854, in trust "for whom it may concern," and the Turkish forces will retire, protesting loudly; Germany and Russia will pretend to be greatly alarmed, and will call for a conference. It would be very dangerous to attempt to predict what will happen then, but it is safe to say that nothing will happen which has not been already arranged. The problem which a conference will have to solve has undoubtedly been much simplified by the action of England with regard to the Suez Canal, as it is taken abroad as well as in England as a clear indication that she has got what she wants, and that the ownership of Constantinople is now a matter of secondary importance to her. The Russian and German semi-official papers both treat the acquisition of the shares as a bold, wise, and natural step, as we ventured some weeks ago to predict they would. To Russia it is pure gain, as it is an abandonment of the position which led to the Crimean war. The unknown element in the affair is what Germany really looks forward to. The acquiescence in British ascendancy in Egypt does not by any means indicate her acquiescence in the Russian acquisition of Constantinople.

There can be little question that it is the uncertainty, and it may be said the anxiety, arising out of this highly interesting but perplexing situation which is producing the extraordinary financial depression which prevails throughout Europe. The cloud which has been hanging over the diplomatic world ever since the Treaty of Adrianople in 1829, when the Russians passed the Balkan, is apparently about to break; and when it breaks, it will bring about a greater change, both industrial and political, than has taken place in the Old World since the fall of the Greek Empire. The enormous and fertile region which that event withdrew from the current of European commerce and civilization, containing even now, when not peopled over one-fourth of its capacity, a population of over 15,000,000, could hardly be reunited to Christendom, and placed under the rule of law, without producing marked effects on the trade and politics of the whole Western world, and, combined with the passage of Egypt under English sway, without making the Mediterranean once more the centre of extraordinary social and commercial activity. The retreat of the Mussulmans from its shores on all sides could hardly be long delayed. The power that held the Bosphorus would inevitably push the Turks far into the interior of Asia Minor, and Tunis and Morocco could not long survive, even in nominal independence, the overthrow of the Sultan. In fact, the amount of materials for political speculation offered by the present condition of the Turkish Empire is so great that it is almost presumption to attempt the slightest handling of them in a newspaper article.

## THE *BOUFFE* IN POLITICS.

WITHIN the past few years the lyric stage of America has been enriched by the importation of a novel and interesting form of art known as *opéra bouffe*. Into the origin of this modern branch of the opera we have no intention of enquiring; it is, so far as we know it, a French importation, brought over here shortly after the close of the war, and, after a

brief struggle with the Puritan traditions of American society, triumphantly domesticated as a legitimate kind of entertainment. When the "Grande Duchesse" first made her improper appearance on the stage, a shudder, it is true, went through the press and the municipal governments of several cities; and in one or two cases, if we remember right, the local mayor intervened for the protection of public morals, and "viewed" in person the antics of *Prince Paul*, *General Boum*, *Fritz*, and the Sovereign of the Duchy of Gerolstein, for the purpose of discovering the exact nature of the immoralities which the law must be called upon to suppress. This virtuous attempt at a censorship of the *bouffe*, however, failed, and after a short struggle the operas of Offenbach, Lecocq, and Hervé carried the day; they now form a recognized feature of the winter's amusement; and even the dramatic critics, who a few years ago always referred to representations of these authors' works in terms of stern displeasure, as being immoral, low, vulgar, subversive of our finer sentiments, now speak of the "merry notes of Offenbach," the "familiar strains of Lecocq," the "drolleries" of the composer of the "Petit Faust," of the "laughable oddities" in the situations of the "Jolie Parfumeuse." We understand now that, to crown the work of the Centennial next year, Offenbach himself, the founder and master of this latter-day opera, is to cross the Atlantic and illustrate in some one or more representations the manner of the French school.

Moralists and mayors having municipal responsibilities may quarrel with all this, but it must be admitted that the spread of the Offenbachian opera, not merely among the French and other loose people of the Continent, but among our own simple-minded, virtuous race, is a fact which to the philosopher is interesting and worthy of explanation, and will one of these days become a matter of some historical interest to such of our descendants as may devote their time to analyzing the puzzling peculiarities of the nineteenth century, in the same way that the dialogues and choruses of the Aristophanic comedy of Attica have become valuable materials for study by us. A highly popular form of art must have some basis in the society in which it flourishes; even burlesque does not make people laugh unless they recognize the thing travestied, and we may be sure that we should never be amused by *bouffe* if there was not a *bouffe* echo within us.

In the modern French comic opera that which is perhaps its most important feature, and has probably contributed more than anything else to its success, is the plot and dialogue. There are of course the music and the lights and the dresses, but these are subordinated generally to the central idea of a *bouffe* comedy. And when we analyze this central idea, whether in the "Grande Duchesse," "Madame l'Archiduc," "Girofle-Girofla," or any of the others, we find that amid all the diversities of the plots and situations there is a link which unites and harmonizes them. They are all founded upon a complete inversion of the moral world and the social institutions as they have been handed down to us from the past. They are not strict satires any more than the adventures of Harlequin and Columbine are satires. The world they represent is a world apart, or rather it is our own world upside down. In the *bouffe* world the metaphysical prophecy of one of the 'Bon Gaultier Ballads,'

> "Cause and Effect shall from their throne be hurled,
> And end their strife in suicidal yells,"

seems to have been fulfilled, and there is no longer any causal connection between moral antecedent and consequent. It is a world in which a fat boor is suddenly made generalissimo because the head of the government has fallen in love with him, and on being asked what service he has seen and what wounds he has received, and replying *aucune campagne, aucune blessure*, is promoted on the spot; in which generals announce their plans of campaign in a *pas seul*, and intimate to their audience their extreme desire to be found somewhere else than at the front should the enemy make his appearance; in which the marks of service that distinguish the veteran from the raw recruit are scratches which he has received in getting over walls; in which a conspiracy is rewarded with high official station, and a crime is the first step in promotion; in which judges inform suitors with gravity that their decision will depend on the amount of the bribe, the sheriff is in the pay of the thief, and acts of successful vice are rewarded with the applause of the good and wise. Ladies of undoubtful reputation rewarded with prizes for their virtue; kings, queens, emperors, dukes, who govern their dominions by putting the incompetent and wicked in the chief offices, and making ability, dignity, and honor public laughing-stocks; geniuses not distinguishable from fools; generals who run off at sight of the enemy, and as they get under shelter sing battle-songs describing their triumphs—these are the *dramatis personæ* of a world in which the ordinary relations of life, the common rules of morality, the instincts and emotions which keep us in the social ranks, are completely inverted, and we find ourselves remitted to what would be a moral chaos were it not bound into a new and pleasant system by the kind of humor we have been discussing.

But is there nothing in the real world of which all this is a travesty? If Offenbach is coming over here next year, it is important that we should consider this question; for if there is no *bouffe* in our politics or society, it will be a mistake for him to attempt to make us laugh. Of course we have no grand-dukes or grand-duchesses, but we may without them have *bouffe*. As a mere suggestion, we will throw out for the benefit of the serious-minded a hint or two on this subject, derived from our recent history.

If we were ourselves going to compose a *bouffe* opera for an American audience, some of the characters and incidents should be the following: In the first place, we would introduce an "Old Man" who has got possession of a rich city by stealing from the city treasury and bribing his way up, and who, as soon as his crimes are discovered, is offered as a reward a statue to be erected by public subscription, and is obliged to decline on the ground that it would be more fitting to put it up after his death. An excellent scene would be one in which he should receive from one messenger a telegram announcing that he has been elected to the State Senate and another that he has just been indicted by the Grand Jury; and a capital point might be made of his being asked, when he is finally convicted and sent to jail, to state his occupation, and his replying that he is a "statesman." We would have him imprisoned, too, and "escape" in a carriage furnished him by the sheriff on the day before he is to be tried; and we would have the concluding scene a serenade—a politico-operatic serenade—of the "Old Man" by "the Boys." There should be another thief, too, an old "pal" of the first, who should rise to high position in the financial administration of the city by the same simple means used by the first; and when the two have together emptied the city treasury, and they are at the end of their rope, we would have them call in three or four elderly and highly respectable citizens and taxpayers to investigate their accounts by the examination of such documents as they chose to exhibit, the examination ending with a certificate that the city finances were being so well administered that within a few years the entire debt would be extinguished—the whole winding up with a taxpayers' congratulatory chorus. We would have a "railroad man" in control of one of the most important highways of the country, the revenues of which he should use to support an opera-house, a private militia regiment, a line of steamboats, and to "make it right with the Old Man." We would have him a colonel on land and an admiral on the high seas, and he should go robbing and swindling his way upward until, having bankrupted his road, and done what he could to make his city uninhabitable, and been assassinated by one of his many victims, we would have his fellow-citizens turn out in crowds to decorate his grave with flowers, a leading clergyman pronounce an eulogy over his grave, and, finally, we would have a monument erected commemorating the efforts of the deceased in the cause of cheap transportation and the development of commerce. There should be parts, moreover, for a bench of elective judges, one of whom should "expose" the character of a brother judge in court for the benefit of the bar, while another should sign orders of court "at chambers" in the house of a noted courtesan; and there should be a scene to illustrate the nature of the elective system, which might be called "Counted In," in which the Old Man and two or three of the Boys should be discovered rearranging the votes cast by their fellow-citizens. Among the *dramatis personæ* there should be a Mayor, a lawyer by profession, engaged in "auditing" bills by voting that they should be audited in all cases by the persons presenting them, and after having in this way enabled the Old Man and the Boys to enrich themselves, he should be indicted by the grand jury and escape through a disagreement of the petit jury, after which we would have him abandon his profession and take to the stage, appearing in the part of a bank-clerk unjustly suspected of robbing his employer. A chorus of one political party explaining that all these little peculiarities of society and politics were the result of "centralization"; a chorus of the other party explaining that it was all due to the fact that the Old Man and the Boys were members of the first party; a chorus of Reformers, led by a professional "pool-seller" and ex-prizefighter, explaining that the difficulty was that the good and wise men had ceased to take an interest in politics and had left them to the corrupt and bad—these might be introduced too. What with "auditors," "plasterers," "safe-makers," "laborers" (these might be discovered playing a game of seven-up during the hours of toil in a corner-lot), and "bummers," there would be no lack of what Mr. Daly calls "contemporaneous human interest."

But it would not be necessary to confine the scene to municipal life. *Bouffe* may be national as well as local. A Chief Magistrate, a Secretary of the Treasury, an Internal Revenue [illegible], Supervisors, Distillers,

Rectifiers, and Whiskey-Thieves, might make some of the *dramatis personæ* in this case. A silent, cold, sagacious man, deeply interested in the education of the young and engaged in a stern warfare on all forms of corruption, should be introduced as our *bouffe* chief-magistrate. A discovery should be made that an organized band of robbers had formed a conspiracy with the Government revenue officials, and that it could not be broken up unless the latter were removed from their posts and the Commissioner of Internal Revenue should issue an order to that effect; on which the silent, cold, and sagacious man should immediately issue an order countermanding the removal; this might be followed by a solo with whiskey-thief chorus, "Let no guilty man escape." If it were not considered too extravagant, the Secretary of the Treasury might delegate to the chief of the Ring the duty of detecting the frauds which he was perpetrating, first carefully investigating his claims to the office, and issuing the commission as soon as he was satisfied that he was an unfit man. Accusations of fraud and corruption, instead of leading, as of old, to hard feeling, should endear the accused to the head of the Government, defeat at the polls should pave the way to a foreign mission, and nothing short of incarceration in the penitentiary should keep a criminal out of office. The chief-magistrate should bring the country back to specie payment by directing his finance minister to issue currency whenever the market was "tight" and contract whenever it was "easy;" he should reform the branch of administration relating to dependent tribes of savages by allowing the head of that branch of the Government against which charges have been brought to appoint his own court of enquiry, define the nature of the investigation, and name the witnesses; and this court, having found the principal charges sustained, should give him a warm letter of eulogy, thanking him for the able and honorable service he has rendered the Government, and a chorus of Christian ministers should invoke the blessing of heaven upon the result.

To support the leading Reformers, there should be a Boss reappointed to office as soon as he had been removed on charges of fraud; a collector of customs performing the duties of his office by cruising about in an armed vessel to prevent the assembling of a local legislature; an ambassadorial claim-agent; and a private secretary of the Chief Reformer under indictment for fraud. There might be an investigation, too, into the foreign financial agency of the Government in the interest of reform, and, on its being ascertained that it was in the hands of eminently skilful foreigners, it should be taken out of their charge on the ground of want of "patriotism," and put into that of a firm of unknown and irresponsible speculators, who should employ a lobbyist at the centre of government to send them news as to the intentions of the Government with regard to the currency and finance; and as "counsel" to this firm it would not be a bad idea to suggest the father-in-law of the stern Reformer himself. The Government should be founded on universal suffrage, and the funds necessary to keep the elective machinery in motion in any great crisis should be chiefly provided out of the proceeds of frauds on the revenue. With music, lights, and dresses, and a lively dialogue, a very attractive little American opera might be made of these simple materials.

## THE YALE AND HARVARD CATALOGUES.

CAMBRIDGE, December 7.

THE Harvard Catalogue is out at last—a long time after its rival, as is, indeed, only natural. The Harvard term begins two weeks later, and the catalogue contains about half its bulk of examination-papers, while the Yale catalogue contains none at all. In one matter, then, we have no data for comparison between the two colleges; he who would institute one must consult the files of examination-papers no doubt preserved in the library at New Haven.

The number of teachers is as follows:

| | Yale. | Harvard. |
|---|---|---|
| Professors | 48 | 49 |
| Assistant Professors | 3 | 2 |
| Lecturers | 9 | 2 |
| Tutors | 19 | 11 |
| Instructors | 7 | 27 |
| Demonstrators and Assistants | 9 | 9 |
| Total | 85 | 119 |

At Harvard, it will be seen, there is a very large force of assistant professors, holding their appointments, we believe, for the term of five years. Appointments are made, too, at Harvard, in certain cases, for a single year. Of the instructors, 12 belong to this class; of the assistants, 6; of the lecturers, 1. This latter arrangement exists at Yale also, but only, it would seem, in the Scientific School.

At Yale, 19 teachers are graduates of the past six years; at Harvard, 31. At each college, 10 of these hold one-year appointments

There are at Yale no officers corresponding to the Dean and Registrar at Harvard, through whom the decisions of the Faculty on disciplinary matters are communicated to the students, and through whose hands petitions pass; nor to the Secretary, who keeps the record of discipline and scholarship; nor, finally, to the Proctors, who keep order at examinations, and have charge of some of the entries where students lodge.

The number of students is:

| | At Yale. | At Harvard. |
|---|---|---|
| In the Theological Department | 99 | 19 |
| In the Law Department | 76 | 161 |
| In the Medical Department | 42 | 192 |
| | 217 | 372 |
| In the Department of Philosophy and the Arts: | | |
| Graduate Students | 61 | Candidates for higher degrees. 35 |
| Special Students | 3 | — |
| Undergraduates | 582 | 776 |
| Scientific School | 224 | 24 |
| Dental Students | — | 33 |
| Bussey (Agricultural) Institution | — | 5 |
| Holders of Fellowships | 2 | 6 |
| Other Resident Graduates | — | 13 |
| Episcopal Theological Students | — | 15 |
| Total | 1088 | 1289 |
| Deduct for names inserted twice | 37 | 11 |
| | 1051 | 1278 |

The number of students to an instructor is, in Yale, 12.2; in Harvard, 10.7.

The number of students in the college proper, added to those in the Scientific School, is about the same in the two colleges: at Yale, 806; at Harvard, 810. No doubt the Institute of Technology in Boston takes many students who would otherwise go to the Lawrence Scientific School; while the Sheffield Scientific School in New Haven receives many who would be in the Academic Department if the latter allowed a free choice of studies. The only choice whatever allowed is between French and German, and between the classics and the calculus, both Junior year. Of course, experience must have shown, and shown as long ago as 1860—for the same regulation stood on the catalogue of that year—that these are the only studies students are competent to choose or reject for themselves. Here are twenty-five subjects,* counting French and German as two, although in reality no one man is allowed to take both in the Yale curriculum; and we may assume that just so much of each is taught as, added to a fit portion of each of the other twenty-five, will cause the average subject to make the greatest progress towards becoming a cultivated man. However, unless I am quite sure my son is in reality an average subject, in no single respect differing from the typical American youth, it is beyond a doubt that some other course than the one long experience has prescribed will best suit his case; some course, namely, which he chooses for himself, or else his instructors or I choose for him.

The following subjects studied at Yale are not studied at Harvard: Natural Theology, Constitutional History, General Philology, the History of English Literature, and Hygiene; and the following, studied at Harvard, are wanting at Yale: Hebrew, Sanskrit, the History of Latin Literature, Roman Law, Italian, Spanish, the Theory of Music, the Fine Arts, Botany, Comparative Anatomy, and Zoölogy. Of course, in each case our list applies only to the college proper, to what is now known at Yale as the Undergraduate Academical Department.

Every student at Harvard must take during the whole of his Freshman year (unless, indeed, he shows on examination that he knows enough of certain subjects to be exempted from pursuing them) Greek, Latin, German or French—depending upon which modern language he presented at his examination for admission—Mathematics, Physics, and Chemistry. The prescribed studies of Sophomore year are Rhetoric, French—unless a French examination was passed on admission or at some subsequent time during Freshman year—Political Economy, the Constitution of the United States, and History. In Junior year, Rhetoric, Logic, Locke's 'Essay on the Human Understanding,' and Physics (lectures) are required. Prescribed studies take up the whole of the Freshman year, and about one-third of the time of the two succeeding ones. A Freshman has sixteen or seventeen hours a week of required attendance, a Sophomore thirteen, a Junior fifteen, and a Senior twelve, besides in the last three classes written exercises. These exercises are all that is prescribed for a Senior; the rest of his work is in electives. The Yale Catalogue gives no information as to the hours of weekly attendance; in 1860, they were for most students sixteen.

* Namely: Greek, Latin, Mathematics, History, Rhetoric, Composition, Physics, Logic, Astronomy, French or German, Metaphysics, Political Economy, Chemistry, Natural Theology, Moral Philosophy, Geology, Anatomy, International Law, Constitutional History, the Constitution of the United States, Philology, the History of English Literature, the History of Greek Literature, and Hygiene.

Although any student at Harvard who chooses to do so may pursue a course similar to that prescribed at Yale, it will be seen that classics, mathematics, modern languages, and chemistry are not insisted upon after Freshman year. Just how many students at Harvard keep on with their classics and mathematics one year or two years longer it would be interesting to know; the catalogue, however, furnishes no data of precisely this character. We can only say that in the present Sophomore class, containing 182 members, enough men take one or more courses in Greek (there are twelve different elective courses in all) to give 126 men a course apiece, and enough take Latin (ten elective courses) to give 139 men a course apiece; the number in mathematics (ten electives) is only 45. The statistics for the Junior class, which numbers 194, are: Greek, 77; Latin, 100; mathematics, 22. Counting each man as having taken only a single course in each study, and those who take Greek as taking Latin also, then 73 per cent. have chosen to continue their classics, and 25 their mathematics, during Sophomore year; while 91 Juniors in a hundred continue or, it may be, resume, after having abandoned for a year, their Latin and Greek, and 11 their mathematics.

In this connection, although it has in reality no bearing on the question how far the free choice of American students would coincide with the course usually marked out for them by the Faculty, it may be worth while to compare the numbers who choose each of the modern languages. Harvard offers this year, in English, Spanish, and Italian, three courses each, and in French and German four. The number representing the popularity of Spanish is 31; English, 45; Italian, 63; French, 193; and German, 220; the most difficult modern language is the favorite choice. These numbers are for all four classes, Seniors and Freshmen as well as Sophomores and Juniors. Freshmen are allowed to recite in the elective which their proficiency in any particular study would enable them to join. This year, in a class of 252, there were taken 74 electives, modern language or other, in place of one or the other prescribed course of Freshman year.

The requirements for admission to Harvard are more difficult than at Yale; the Harvard Catalogue adds to the Yale list a knowledge of Greek Composition, of Ancient History and Geography, and of Physical Geography, besides the elements of some physical science. At Exeter, it takes a year longer to prepare for Harvard than for Yale. The difference between the requirements of the two colleges is seen to be still greater if we take into account the more advanced courses in Mathematics and in Classics upon which some candidates for admission to Harvard come prepared. Separate sections for the better scholars are formed in some of the studies of Freshman year, and sometimes in subsequent years. At Yale, we notice that Freshmen still seem to review during the first term some of the mathematics a knowledge of which is requisite for admission.

There are many other points on which a comparison between our two foremost universities, if one had time to make it, would prove of the highest interest, just as there are of course many things about which an old graduate would gladly be informed, but which it does not belong to a catalogue to set forth: the kind of intercourse in the recitation-room between the teacher and the individuals of his class, the town and gown spirit, the footing on which members of different classes meet, the life in college societies, etc., etc. From the two catalogues, the impression one gains is that Harvard is a complex organization, constantly engaging in new forms of activity, while at Yale a system the reverse of complex, in which the experience of the college authorities has for many years been able to detect scarcely a flaw, is clung to with an affectionate pertinacity which excludes the supposition that it has not, in their opinion, perfectly stood the test of time. The generous rivalry of Yale and Harvard—a rivalry from which so much good to the cause of higher education in America should flow—would cease if the one college should ever gain too great a start upon the other. It is only by comparing from time to time the stand each takes that such a misfortune can be averted.

A Yale Graduate.

# Correspondence.

## A LETTER FROM "PI-UTE CHIEF."

To the Editor of The Nation:

Sir: Referring to your reply to my note of the 26th ultimo contained in the *Nation* of the 9th instant, I beg to suggest that every fair-minded and decent man who reads it will not fail to mark the great distinction between your statement quoted in my note and your reply. You first charged me with writing certain letters "defending Delano and whitewashing the Interior Department and the Indian Administration, and of generally taking the part of counsel for the defence." Now you say the letters "were in substance an attack on Prof. Marsh, and were so constructed as to have no meaning except as a defence of Delano and Smith." Your first statement was false in everything intended to be conveyed by it, and is so admitted to be by your second one. Your second statement is not only equally false in every particular, but is also a very weak and contemptible effort to dodge the responsibility of the first one.

You say that when I "deny the authorship of the 'Pi-ute' letters, you will produce the proof." But I do not deny their authorship. I did write them, and, as they are the proof you threaten to produce, I shall be sure of the verdict of every man who read them that your second charge is equally false with the first one, and doubly as mean. Now, publish the letters fairly, and let us have the verdict of your readers, as we shall certainly have of the readers of the *Globe-Democrat*.

I insist upon holding you to the charges as originally made, and am not to be led off upon side-issues in reference to "puffing the chairman" or "attacking Prof. Marsh." Both these charges are also false, but we will discuss them when they are reached in their order. I have no newspaper, and am therefore greatly at a disadvantage in such a contest as this; but when I obtain the verdict of the public against you upon the original charges so wantonly and maliciously made against me, I will then be ready to take up the other issues of fact between the *Nation* and myself, and such other slanders of the *Tribune* as the *Nation* may be willing to endorse and become responsible for, and will abide the decision of an intelligent and honest public upon all of them.

If Prof. Marsh thinks I have attacked him, he is very able to defend himself; and if he, like myself, is not an editor of a newspaper, we can try the matter upon an equal footing. Indeed, if he has any cause of complaint against me, he may cite me before the Faculty of Yale College, and I will be tried by them and submit to their verdict, when I am fully heard.

Respectfully,

Tho. C. Fletcher.

St. Louis, Dec. 11, 1875.

[We print the above now as a matter of justice to the writer, but are unable, for want of space, to reply to it till next week. It will be observed that Governor Fletcher does not deny that he is "Pi-ute Chief," and the only question now at issue is as to the nature of the correspondence. To ask us to republish all these letters, which filled some dozen or so columns of a daily paper, in the *Nation*, is one of those requests which we should think more natural from a real, naked, red Pi-ute than from a white brave, accustomed to the ways of civilized life and journalism, but is, no doubt, to be explained as a stroke of aboriginal humor, in which, as the readers of the "Pi-ute" letters know, the ex-Governor is an expert. We will, however, do all we can next week, short of republishing the entire series, by reproducing as many extracts from the correspondence as possible, showing its general drift. We believe that Mr. Fletcher has already published this second letter to the *Nation* in the St. Louis *Republican*; why, we are not informed, but we suppose because he has "no newspaper" in which to reply to attacks.—Ed. Nation.]

## PROFESSOR TYNDALL AND AMERICAN SCIENCE.

To the Editor of The Nation:

Sir: I have been favored with a copy of the *Nation* of October 28, and would ask permission to make a few remarks on the critique of my work on 'Sound' therein contained.

With regard to Professor Henry, I hope I am not presumptuous in venturing the opinion, and expressing the belief, that his earlier scientific labors were marked by rare power and originality, and that his later years have been usefully and honorably employed in the service of his country. Such, if I dare say so, are the sentiments which I have ever expressed regarding Professor Henry here and elsewhere.

When I first learned that he was in danger of falling into what I considered to be grave scientific error, I went as far as friendliness dared go to avert it. I addressed to him a private letter, in which I tried to impress upon him the completeness and conclusiveness of the evidence which he seemed disposed to call in question. He did not honor that letter with any notice, preferring to discuss the subject publicly in the 'Report of the Washington Lighthouse Board.' He was clearly within his right in doing

so ; but I submit that I only exercised my right when I met him on ground thus chosen by himself.

No English gentleman that I have consulted can discern in what I have written any violation of the dignity of scientific debate ; but your article would lead to the inference that I had both violated common honesty and taken leave of common sense. I will not quote your words, because I cherish the hope that when you have reflected on them you will regret them. When I say "you," I mean the Editor of the *Nation*, whose acquaintance I had the honor to make, and whose kindness I had the privilege to experience, in New York : I do *not* mean the writer of the article. Let me respectfully assure you, then, that when I spoke of being "deflected by authority," "Professor Henry's solution of Ocean Echoes" was not at all in my mind, nor his "ruin," partial or total, in my calculations. Consider, I pray you, how impossible it is that this could have been the case. The "deflection" spoken of is expressly described as occurring at the outset of an investigation begun in May, 1873, *whereas the Washington Report containing "Professor Henry's Solution of Ocean Echoes" is the Report for* 1874, *which did not reach Europe until the spring of* 1875. This, then, is the crumbling foundation on which your critic builds his odious charge. In verity, the remark on which he pours his peroratory invective was not meant for "laudation" of any kind, but merely to show the "polar" character of authority—its good side and its bad.

It is easy, as you know, Mr. Editor, to sneer and to assail, but less easy to show, without going into details not worth the labor, that the sneer is unmeaning, and the assault unfair. Nevertheless, the broad lines on which, in the present instance, I would meet my anonymous assailant may, I think, be made clear. He industriously mixes together things which ought to be kept apart—experiments on fog-signals, and enquiries into "the causes which affect the transmission of sound through the atmosphere." The "blank" which I proposed to fill is stated, with unmistakable clearness, to have reference solely to such "causes." Neither Herschel nor Robinson, as far as I know, ever made an experiment on fog-signals ; still I quote them. Why ? Because they are the most eminent and authoritative exponents of the theories of acoustic opacity which up to last year were entertained by the highest scientific minds. Theirs, moreover, and Arago's (not Professor Henry's), was the "authority" which "deflected" me at first. Apart from the wind, the "causes" of acoustic opacity endorsed by these eminent men were rain, hail, snow, haze, and fog - everything, in short, that affected the optical clearness of the atmosphere. Prior to the South Foreland investigation, where, I would ask, is a "systematic enquiry" into these causes to be found ? Surely, if such an enquiry has been published, it can be courteously pointed out and calmly discussed. If you can prove its existence, you will have a right to demand from me the very fullest apology and reparation for stating that "no such systematic enquiry had to my knowledge been made." Even then I could not charge myself with untruth, for my "knowledge" was, and is, arithmetically what I have affirmed it to be ; but I can confess ignorance and express regret.

Give me your patience while I endeavor still further to make this matter clear. As regards the invention of instruments and their practical establishment as fog-signals, so far was my knowledge behind "the science of the United States," that I had never seen or heard one of those great steam-whistles until I met them at the South Foreland. The common "Syren" is well known to have been a familiar instrument with me, but the fog-syren I first saw and heard upon its native soil in America—not, however, as your critic puts it, but at the request, twice repeated, of Professor Henry. Further, to the best of my recollection, prior to the month of May, 1873, I had only heard one or two experimental blasts from a fog-trumpet. In such work, then, I had neither part nor lot ; and, if you will permit me to say so, though it is of the utmost practical value, I should hardly label such work with the name of "science." Quite apart from those practical achievements lies the enquiry into "the causes which affect the transmission of sound through the atmosphere." And, if I except the sagacious remark of General Duané which has been so curtly brushed aside, not a scintilla of light has been cast upon these causes by any researches ever published by the Lighthouse Board of Washington.

Will you allow me to say, in passing, that Major Elliot, the able and conscientious officer whose excellent report on the lighthouses of Europe was so displeasing to the Board, *did* accept the invitation to Dover, and that to the present hour I feel indebted to him for the information and advice given to me at the time ?

Upon my "conduct," and the knowledge which "influenced" it, your critic rings the changes of his wit. It is, after all, a very simple and straightforward matter. The "conduct" consisted in my emphatic advice to the Elder Brethren of the Trinity House not to confine themselves to home-made apparatus, but to include American ones in their enquiry. The subsequent trial led to the abandonment of the English instruments and the adoption of others from Canada and the United States. The *Syren*, for example—which your critic erroneously says was lent "gratuitously" to *me**—was paid for in February, 1874, and two others are at this moment on their way from New York to England. Both by word and deed have we acknowledged our real obligations to the United States ; but what we did not and could not acknowledge (for it was non-existent) was any solution of the conflicting and anomalous results obtained with these fog-signals—results so conflicting and so anomalous as to cause reflecting minds to entertain doubts as to the capacity of the observers. Apart from the friendship shown to me at the time, all that I remember of the meeting at Washington to which your critic refers is the utter perplexity of everybody present, myself included, in regard to the matter in hand. I had my guess—others had theirs ; but we were quite at sea in our guesses, without a signal to guide us through the intellectual fog.

Knowing, indeed, the difficulty of the subject, when its investigation was first proposed to me by the Elder Brethren, I shrank (as Faraday had done before me) from a work of such obvious labor and such uncertain scientific promise. Doggedly, however, we attacked it, determined to go through the mechanical processes already followed by others, even if they led, as regards science, to an equally barren result. Out of the darkness at length came the dawn. We prolonged our investigations until they embraced every agent save one to which influence had been previously ascribed. The exception was snow. This, however, was directly met by observations made upon the *Mer de Glace* in the bitter winter of 1859, and which have been entirely confirmed by the later observations of General Duane. Having negatived antecedent theories, we wrought our way positively to the basis of the whole question. This we found in a cloud-world, invisible to the eye of sense, but as visible and certain to the mental eye as the ordinary cloud-world of our atmosphere. The lights and shadows of these "acoustic clouds"—the action of which must, at one time or another, have been noticed by every peasant within range of a peal of bells—sufficed to account for the most astounding variations of intensity. This, I say, has been established, not only by patient and long-continued observations afloat, but by laboratory experiments as indubitable as any within the range of physical science.

And, let me add, it was neither whistles nor trumpets, nor yet the Syren, which pointed out the way to this solution, but experiments with *guns* ably served by artillerymen from Dover Castle.

I will not make any further draft upon your generosity, though, were it worth while to do so, other fallacies of fact and logic in your critic's article might be exposed. He says, or intimates, for example, that I became "adviser" to the Trinity House after my "lecturing tour in the United States in 1873." I relieved Michael Faraday of this duty in May, 1866. My friends in New York have already had to disperse other delusions regarding the "profits" of that "tour." Such statements are credible to the mean, incredible to the high-minded, and were therefore never thought worthy of refutation by me. And why should I now waste a word upon your critic's closing sentences ? It will not make him noble to be told that envy is ignoble ; that if ever "praise" has been adjudged to me by his countrymen, it is not because I went out of my way to seek it. It came to me unasked—an incident, not an aim—shining, as your own Emerson would put it, pleasantly because spontaneously, upon the necessary journey of my life. It was not, I can say truly, the applause of large assemblies that constituted my chief happiness in the United States, but the ever-growing proof, for the most part undemonstrative, that, without swerving from my duty, I had gained a modicum of the affection of the American people. *That* I prized, and *that* I have sought to keep free from fleck, material or intellectual. For reasons best known to himself, your critic does not relish this relation ; and he will damage it if he can. I cherish the belief that he will be unsuccessful.—I have the honor to be, your obedient servant,

JOHN TYNDALL.

LONDON, November 23, 1875.

---

[In cheerfully giving a place to the foregoing communication of Dr. Tyndall, we ought to premise that the controversy on which it hinges did not originate in our columns. Just as little did it originate in any "ignoble envy" on our part, for we found it flagrant in the preface of the book on 'Sound,' devoted, as that preface mainly is, to a scientific polemic with the Chairman of the Lighthouse Board in Washington. Professor Henry having stated, in the

* It was lent to the Trinity House Corporation ; and I expressly signalize the lending "as an act of international courtesy worthy of imitation."

last annual report of that Board, that its researches have been "much more extensive on this subject [fog-signalling] than those of the Trinity House," and Dr. Tyndall in his preface having expressed the opinion that the claim thus made was "inordinate," we did but emphasize the facts and considerations which, in our judgment, confirmed the claim in all its breadth.

Taking up the points of Dr. Tyndall's reply in the order he gives to them, we may say that his criticism on our construction of the passage in which a reference was made to the "ruin of authority," has been anticipated in our columns. We were in error in supposing that the claim of Dr. Tyndall to have ruined "authority" on this question was aimed at Professor Henry; but as the "odious charge" of self-assertion, imputed to Dr. Tyndall in the premises, rested upon the alleged immodesty of such self-assertion, whether directed to the disparagement of Herschel, Arago, or anybody else, it is not apparent to our minds that Dr. Tyndall has met the gravamen of the charge by showing, as he does from the date of the reception of Professor Henry's report in Europe, that he could not have referred to Henry's "solution of ocean echoes." It would have been more in order for him to show the propriety of his language in claiming to have "ruined" the "authority" of any one among his scientific predecessors, for it was on the alleged self-conceit implied in such a claim *as made by himself* that we based our "peroratory invective."

We ascribed to Dr. Tyndall a want of "scientific generosity" in ignoring the alleged fact that Professor Henry had made "systematic enquiry" before his own into the causes affecting the intensity of sound; and we further supposed from the acknowledgments contained in Dr. Tyndall's preface, that he therein *admitted* the possession of such a general knowledge under this head as should have served to modify the statement found in the body of the book, where a contradictory statement seemed to be made. This supposed "inconsistency of statement" was the ground on which we ascribed to Dr. Tyndall a want of "dexterity in literary art." In his preface, referring to the "experiments and observations" of Professor Henry, as published in the Annual Report of the United States Lighthouse Board for 1874, Dr. Tyndall wrote as follows: "I was quite aware, in a general way, that labors like those now for the first time made public, had been *conducted* in the United States, and *this knowledge* was not without influence on *my conduct*." As he certainly asserts that *his* scientific researches were conducted with paramount reference to the discovery of the causes which affect the intensity of sound, and as he here expressly stated that his knowledge of the "labors conducted" in the United States had not been without influence on his "conduct," it was natural, and, according to the obvious meaning of English speech, it was inevitable that we should see in this statement an over-late concession to American science, which would have appeared to better advantage, as we thought, in the "summary of existing knowledge" contained in the seventh chapter of Dr. Tyndall's book, where a conflicting statement, entirely ignoring the existence of such antecedent labors in respect to these causes, is undoubtedly made.

Dr. Tyndall now explains that his knowledge of what had been done in the United States influenced his "conduct" to the extent only of advising the Elder Brethren of the Trinity House to use American as well as British apparatus in prosecuting their enquiry. It follows, therefore, that the alleged want of "literary art" assumes, in the presence of this explanation, the proportions not of an inherent "inconsistency of statement," but of a surprising ambiguity and infelicity in this part of his preface. Moreover, as he now disavows the acquisition, while he was in the United States, of any knowledge, general or special, respecting the causes which affect the intensity of sound, we can only say that he must be held better entitled than ourselves to know what he learned or what he did not learn in this country. But we think it important to call the attention of our readers to the fact that this disclaimer does not meet the point made by us under this head, for we contested the historical accuracy of Dr. Tyndall's statement that there had been no "systematic enquiry" into the causes affecting the intensity of sound since the year 1708. It is not enough for Dr. Tyndall to say that the researches of Prof. Henry, even as now published, do not cast a "scintilla of light" on the causes which affect the transmission of sound through the atmosphere. In order to meet our allegations, it is necessary for him to state that while he was in the United States he did not acquire a knowledge of the alleged fact that the Washington Lighthouse Board had made "systematic researches" directed to a discovery of these causes. The question between us is not one of *science*, but of *historical fact*. Did he, or did he not, learn, while in this country, that Prof. Henry had made systematic researches into these causes? If he did, the statement contained in the body of his book is inaccurate. If he did not, the statement was erroneously impeached by us. If it were a question of science, it would be proper to call, as Dr. Tyndall does, for a published paper; but as it is simply a question of history which we raised, it will suffice to receive from Dr. Tyndall the assurance that in listening to the paper read in his hearing before the Washington Philosophical Society by Prof. Henry, he did not learn from it that the paper was the result of systematic researches into the causes which affect the transmission of sound through the atmosphere.

We need only briefly advert to the minor inaccuracies which Dr. Tyndall supposes himself to find in the review. It was stated by us that "Major Elliot reached London a few days before Prof. Tyndall *began his experiments at Dover*, and was courteously invited to be present, but for want of time was compelled to forego the privilege." What privilege? The privilege of being present at the "experiments," we need not say. We merely cited the language of Major Elliot himself, whose report of the matter is as follows: "The limited time at my disposal did not allow me the pleasure of accepting an invitation to join them [the experimenters], and I had only an opportunity of observing the machines themselves at the experimental station at South Foreland." The verbal correction that the Syren was lent by the Washington Lighthouse Board to the Trinity House Corporation, and *not* to Dr. Tyndall, is frankly accepted by us on his own assurance. As to the date of his appointment as the scientific adviser of the Trinity House, while we were aware that he held this office at the time when he was in the United States, we were not informed as to his antecedent labors in connection with it.

In conclusion, we beg leave to add that we had not the slightest wish to detract from Dr. Tyndall's repute in the United States, but simply desired to prevent the labors and investigations of American science from being relegated by him to the state of historical nonentity, as he seemed to us to attempt to do, when, in his book on Sound, he denied equally the existence and the value of any researches in this country, directed to a discovery of the causes affecting this intensity of sound, anterior to his own investigations.—Ed. Nation.]

# Notes.

THE United States Geological Survey of the Territories (Hayden's) has just issued Vol. II. of the 4to series of Reports—an extended and elaborate 'Memoir on the Vertebrate Fauna of the Cretaceous Formations of the West,' by E. D. Cope, the eminent palæontologist. The work is illustrated with numerous lithographic plates, and at once takes an acknowledged place as the most complete exposition of the subject as at present understood ——The 'Bulletin of the National Museum,' published by the Department of the Interior under the direction of the Smithsonian Institution, is a new medium of communication with the scientific public, designed to make known results of study of the material contained in the collection at Washington. The papers appear independently of each other, separately titled and paged, but will subsequently be gathered into volumes of convenient size, upon the plan of the well-known 'Smithsonian Miscellaneous Collections.' Nos. 1 and 2 have appeared, the first being Professor Cope's Check-list of North American Reptilia and Batrachia; the second the Report of Dr. J. H. Kidder (edited by Dr. Coues) on the ornithological collections made by him at Kerguelen Island while he was attached to the

American Transit-of-Venus Expedition. Other papers will soon follow. ——Volume V. of 'Reports of the Explorations West of the 100th Meridian' (Wheeler's), being the volume on general zoölogy prepared by Dr. H. C. Yarrow, with the co-operation of several well-known specialists, is all in type, and will appear as soon as the work on the illustrations is completed —and this, we understand, is nearly finished. The volume will make about 800 quarto pages, illustrated with 45 chromo-lithographs. ——Additional numbers of Dr. Hayden's 'Bulletins' have just appeared, containing the usual variety of articles from different hands. The former "series" of this publication consisted of unconnected pamphlets, separately titled and paged; the numbers of the current "second series," though issued separately (sewed), are continuously paged, with the design that the greater part of the edition shall be made up into a yearly volume. The publication thus becomes a regular serial, though the numbers first appeared irregularly—a practical advantage over the former plan which bibliographers and all those who have occasion to quote the periodical will appreciate.—— Two numbers of the *Scientific Monthly*, a publication recently begun at Toledo, O, have reached us. The editorial responsibility seems to be personal, though the publication may have some connection with a scientific association existing in that city. Some of the articles are from known sources, and are fairly good, but the general appearance of the magazine is undeniably bad, and there is, we suppose, little prospect of success in this case.——We some time ago expressed our opinion that Mrs. Mary Mapes Dodge's delightful children's story, called 'Hans Brinker; or, The Silver Skates,' deserved an entirely new dress, with illustrations made in Holland instead of in America. The publishers (Scribner, Armstrong & Co.) have just issued an edition in accordance with this suggestion, and we hope it is not too late in the season to announce the fact. The pictures are admirable, and the whole volume, in appearance and contents, need not fear comparison with any juvenile publication of the year, or of many years.—— We must also give a word of praise to the translation of Dr. L. Sauveur's 'Chats with the Little Ones' (Estes & Lauriat), which parents will find to be a very high order of object-lessons.——The Water-Color Society will open its ninth annual exhibition in this city January 31, and close February 26. Pictures will be received from the 14th to the 19th of January.

—The second 'Reference Catalogue of Current Literature' (London: Joseph Whitaker) and the third 'Publishers' Trade-list Annual' (New York: F. Leypoldt) reach us together. The English volume is noticeably slenderer than its bulky predecessor; and with some surprise we look in vain for the catalogues of such houses as Blackwood, Murray, Routledge, and Williams & Norgate. In fact, there are forty fewer contributors than last year, and Mr. Whitaker announces that his next edition will not appear till 1877. He calls attention, however, to the improved character of the index, which is much fuller than last year's, and includes no fewer than 17,000 works or collections. It is this feature which for the first time distinguishes the 'Trade-list Annual,' following the example of the 'Reference Catalogue,' just as the latter work was called into being by the former. Mr. Leypoldt's disparaging estimate of his own index must not be taken too literally, but as indicating his consciousness of how far it falls short of ideal bibliography. His subscribers will not, we apprehend, have many reproaches to make him, even judged by this standard; but they may reasonably reproach themselves for the want of uniformity and punctuality in getting out their catalogues, which has caused him so much needless trouble and annoyance. Uniformity will, we do not doubt, be attained in time, but punctuality may prove something beyond control. In spite of all obstacles, Mr. Leypoldt reports a gain of four firms over the total representation of last year. Besides the general index, which, as compared with Mr. Whitaker's, appears to be at least one-half fuller, he gives educational, law, and medical indexes, and an index of specialties in the book and stationery trade. Both these volumes are achievements of incontestable value, and must do much to improve the trade, and to aid book-buyers directly and indirectly. They ought to be accessible in every public library and in the leading bookstores of the country.

—A few books in holiday attire still lie upon our table, and will receive here such brief notice as we can give them. 'The Sea' and 'The Insect' of Jules Michelet (New York: T. Nelson & Sons) belong in that curious and more or less fantastic series of scientific excursions in which the French historian found recreation from pursuits for which he was better fitted. Of all of them it may be said what he himself has avowed of 'The Insect': "It has sprung wholly from the heart. Nothing has been given up to the intellect, nothing to systems." They are, therefore, works which the student will and must pass by, but the general reader need not despise the instruction they contain. The illustrations by Giacomelli greatly embellish 'The Insect'; those in 'The Sea' are much less numerous, and would hardly be missed. 'Laurel Leaves,' a companion or sequel to the 'Lotos Leaves' of last year published by the same firm (Boston: Wm. F. Gill & Co.), is made up of contributions in prose and verse by writers, mostly American, of every degree of eminence. We have not observed that in any instance their laurels will be the greener on account of their performances in this volume, and we therefore cannot predict for the work an enduring reputation. The illustrations are also of mixed origin and merit. The book is handsomely printed and tastefully bound. 'Silhouettes and Songs Illustrative of the Months' (Boston: Lockwood, Brooks & Co.) holds a doubtful middle place between juvenile and adult literature. The designs are by Helen Maria Hinds, a young lady of fourteen, and do her credit, albeit the art is not so difficult as is apt to be supposed. They are all concerned with the representation of children, and some of the verses which accompany them are plainly nursery rhymes, and most of them relate or are addressed to children, though that does not make them proper reading for children. The selections have been made by the Rev. Edward E. Hale. The admirers of Mr. Will Carleton and Mr. Benjamin F. Taylor will be gratified by the illustrated editions of the former's 'Farm Legends' (Harpers) and the latter's 'Songs of Yesterday' (Chicago: S. C. Griggs & Co.) As popular Western poets these authors may challenge a degree of attention which their productions would certainly not receive on their merits.

—To the foregoing we may add mention of two other works suitable for gift-books, viz., Mr. Allibone's 'Prose Quotations, from Socrates to Macaulay' (Lippincott), and Mr. Edwin Abbott's 'Concordance to the [original Poetical] Works of Alexander Pope' (Appletons). The 'Prose Quotations' we find rather less dreary and more useful than the same compiler's 'Poetical Quotations'; and its 8,810 readings from 544 authors on 571 subjects will be well received by a large class, and will instruct at least in the proportion that they interest. The work is of a kind of which there need be no end, being put together without any but a moral order, and according to the compiler's fancy (say) for Burke and Macaulay over Bentham and Mill, yet including the greatest names in English literature. The topics are mainly abstractions like Admiration, Cheerfulness, Knavery, Public Spirit, Zeal, etc.; but there is a liberal admixture of concretes like Coins, East India Company, Microscope, Spaniards, Whigs, etc. A few countries, viz., America, England, France, Greece, and Italy, and some two score of eminent personages from Homer to Warren Hastings, furnishing headings for Mr. Allibone. These last illustrate more curiously than any other feature the accidental character of the 'Quotations.' A good concordance to the works of a great writer is always and under all circumstances praiseworthy, and a very hearty welcome can therefore be given to Mr. Abbott's concordance to Pope. It fills 365 closely but clearly printed pages, and is preceded by a brief but helpful introduction from the pen of Dr. Edwin A. Abbott, who discourses of Pope's style, and points out peculiarities in his use of words and idioms, and in his metre. Speaking of Pope's English as being eminently modern, he says: "We may glance down page after page of this concordance without finding a line or phrase that might not have been written in the nineteenth century." He used few archaisms, and his grammar generally hardly calls for remark. To Pope's apparent fondness for the sound of *s* Mr. Abbott attributes the fact that there are nearly twice as many entries under that letter as under any other. He never used *rang* or *sang*, but *rung* or *sung*, etc.; neither *also* nor *towards* will be found in the Concordance. Two pages are given to examples of irregular or unusual rhymes; but they are surprisingly few.

—Our remarks on the autopsy performed on the late Vice-President have elicited some criticism from our medical readers. A Boston physician writes: "You say 'the doctors, without the slightest necessity, for they knew he died of apoplexy,' etc. I think we do not yet know what Wilson died of. It is stated in the autopsy made by Dr. Lamb, of the Surgeon-General's Office, that there was *no extravasation* in the brain, but 'the spinal canal contained a large quantity of dark fluid-blood.' In view of the hasty nature of the examination, I feel uncertain as to the source of this blood, nor do I feel sure that its presence would be necessarily fatal, nor that the symptoms attending the death were consistent with the supposition that this blood caused his death. Microscopical examination will probably assist our diagnosis; but as yet I do not see that the assumption of 'nervous apoplexy dependent probably on cerebral anæmia' is the correct one either. The last number of the Boston *Medical and Surgical Journal* contains a Washington letter upon the subject."

—The accusation of plagiarism may be met in two ways; either a plea of unconscious coincidence can be entered, or the theft can be boldly acknowledged and justification attempted by means of alleged improve-

ments. In the latter case the plagiarist maintains that he did not steal, he conquered—to use the words applied to Ben Jonson by an early critic and to the elder Dumas by himself. He takes shelter under the fact that Shakspere did not invent his plots, and under the fiction that Molière once replied to a similar accusation : "Je prends mon bien où je le trouve." As M. Eugène Despois has proved the impossibility of Molière ever having breakfasted with Louis XIV., so M. Edouard Fournier, in his entertaining volume upon 'L'Esprit dans l'Histoire,' has shown the falsehood of this other *mot* by tracing Molière's exact words. The Gascon Cyrano, who was privy to many of Molière's first attempts at dramatic composition, profited by the poet's long professional absences in the provinces to introduce into his own comedy, "Le Pédant joué," one of the scenes which he had gleaned from Molière. When the latter at last returned to Paris in the full plenitude of his powers, he disdained reclamation. But later, as his mind became fatigued, and he retouched for Parisian audiences the earlier farces which had delighted the provincials, he unhesitatingly made use of the scene which Cyrano had stolen from him years before, saying, "Je reprends mon bien où je le trouve." This is the version given by Grimarest, the only original recorder of the phrase which has since been perverted. Instead of audaciously asserting a right to take his material wherever he found it, Molière only declared the right to take back his own. A popular error dies hard ; and it is perhaps useless to hope that petty plagiarists will ever refrain from citing the greatest of French dramatists as having set them a bad example.

—J. W. F. writes us from Tours, France, under date of Nov. 30 :

"The librarian of the library of Tours, Mr. A. Dorange, has made, with much expenditure of labor and of time, a catalogue of the manuscripts preserved in it—a collection which is deservedly famous. This has been published in a handsome volume of 580 pages quarto, beautifully printed on fine paper, at the expense of the city of Tours. A small edition only has been issued (two hundred copies, I believe), intended principally as presents to various libraries of France and to foreign governments, with a few for sale to such as may require them. I am assured that a copy will be presented to our Government for the Congressional Library.

"The great value and interest of the manuscripts of the library of Tours are well known. It possesses the handsomest manuscript on parchment known in Europe—that of the Evangelists of the eighth century, written in letters of gold—and numerous others of the highest value. The catalogue contains mention of 2,000 manuscripts, of which more than 200 have miniatures. It is not a merely dry list, but in all cases where there is sufficient inducement a full description, with citations of the most important portions of the subjects, is given. The variety and richness of the collection are explained by the number and celebrity of the religious establishments of Touraine, of whose manuscripts the library has become the heir and guardian. Thus the old libraries of the Cathedral, of the Abbey of St. Martin, and of that of Marmontier have contributed the remains of their treasures.

"The library of the Cathedral had its origin in the fifth century, when the sixth Bishop of Tours bequeathed his library to the Chapter of the Cathedral, 'except the Evangelists, which Hilaire, Bishop of Poitiers, had written with his own hand.' Of 460 manuscripts catalogued in 1706, the library of Tours possesses 309. The library of the Abbey of St. Martin of Tours was founded by the celebrated Alcuin, who was appointed by Charlemagne to revise the sacred texts, and who established about 796, in the Monastery of St. Martin, *ateliers* of copyists, from which issued, amongst others, the beautiful Evangelists in golden letters above referred to. In 1730 an inventory of the manuscripts of the collegiate of St. Martin was published. It contained 272 articles, of which this library now possesses 140. The library of the Abbey of Marmontier dates from the time of St. Martin himself. One of the principal occupations of its monks was to copy manuscripts. A catalogue of the manuscripts of that abbey, made in 1754, names 360, of which the library of Tours contains 263, many of them very precious. Numbers of them are among the oldest French manuscripts. Several are the most ancient monuments of French literature. In addition to the foregoing, there were twenty-five or more religious institutions which have contributed to this collection most valuable MSS.

"Many of these manuscripts are bound in rare bindings, and several bear arms of noble houses—of Anne de Bretagne, Diane de Poitiers, Henry III.—all of which are described in the catalogue. A list of a few of the most precious of these manuscripts may not be uninteresting. These are : The Evangelists, in gold letters and rare binding, of the eighth century ; The Bible, called that of Charles the Bald, of the ninth century ; *Sacramentaire* of Pope Gregory the Great, of the tenth century ; Life of St. Martin, by Sulpicius Severus, of the eleventh century ; Missal, containing wonderful miniatures, of the twelfth century ; Psalter, with miniatures, rare binding, of the thirteenth century ; Missal, for use in the English Church, of the fourteenth century ; Livre d'heures of Anne de Bretagne, of the fifteenth century ; another, containing beautiful miniatures, of the fifteenth century ; Titus Livius, with two great miniatures, one of the battle of Cannes, and ornamented, by order of Louis XI., by the best artists of the fifteenth century. There is a Latin dictionary of the ninth century, a prosody of the tenth, a collection of Greek historians brought from Cyprus, of the eleventh, a Cicero, Terence, and Ovid, of the twelfth. There is no space to mention more of these treasures.

"Mr. Dorange commenced this catalogue more than ten years ago, and has devoted all his leisure to the completion of it. Some idea of the labor may be formed when it is stated that he had to decipher and read all these manuscripts in order that he might give a proper description of them, and such extracts as he deemed most interesting. Those of your readers interested in such matters cannot fail to be gratified by the mention of this great work. It is the most carefully compiled catalogue of manuscripts which exists, and is entirely worthy of its admirable and interesting subjects."

—A fresh light has just been thrown upon one of the most hideous epochs of modern history by Professor Villari's publication of the despatches of Antonio Giustinian, who was the ambassador of Venice in Rome from 1502 to 1505. These papers were among the valuables carried to Vienna by the Austrians when they withdrew from Italy ; and one of the benefits arising from the restitution recently made is the appearance of Villari's volumes. They cover the last sixteen months of the pontificate of Alexander VI. and the commencement of that of Julius II., their main interest naturally centring in the sayings and doings of the Borgias while their ambitious schemes were ripening to fruition, to be cut short by the sudden death of the father. It would not be easy to convey a more vivid impression of the scandals of the time than is afforded by the quiet jottings of the Venetian diplomat, recording how the Holy Father amused himself with comedies and masquerades and the sports of the Carnival of 1503, when, his son having captured and slaughtered the Orsini at Sinigaglia, he was completing the task by executing and poisoning the members and adherents of the family in Rome, sacking their palaces, and carrying off the booty to the Vatican. No time, apparently, was lost in this latter portion of the work. When the Cardinal of St. Angelo died, as was asserted of poison, on the night of April 10–11, Giustinian, visiting the Pope on the 11th, was carried by him into a room where his creatures were already busily engaged in counting the spoils of the victim ; and Borgia pathetically complained that he was reported to have secured at least 80,000 to 100,000 ducats by the operation, but that there was only a paltry 23,832, to confirm which he called upon those engaged in the work to verify his statement. It is some satisfaction to know that when, four months after this, the monster died, he made "el più brutto, mostruoso et orrendo corpo di morte che vedesse mai," and that for very shame his corpse could not be openly shown to the people in the funeral ceremonies. The faculty of abhorrence seemed to have been exhausted by the revelations of Burchard and the suggestiveness of Machiavelli ; but Giustinian has shown us the possibility of even deeper degradation in an infallible Vicegerent of Christ.

## THE ARMY OF THE CUMBERLAND.*

CHAPLAIN VAN HORNE'S 'History of the Army of the Cumberland' is one of the most important contributions to the story of the war of the rebellion which has yet appeared. It professes to be based upon materials mainly collected and supplied by General George H. Thomas himself, including his military journal, which is said to give accurate mention of the operations of each day and brief notes of the more important facts and events. A glance at the array of reports, despatches, orders, and letters referred to as authorities and quoted, shows that a long-continued and methodical collection of material had been made by Gen Thomas or some one under his eye, and that the author has thus been furnished with exceptional facilities for his work. The maps, in number, accuracy, and finish, are superior to those of any similar book upon the late war, and were prepared by the Superintendent of the Topographical Engineers-Office of the Department of the Cumberland, who had supervision of the official surveys of the battle-fields and lines of works upon a large part of the theatre of war in which took place the operations narrated in the history. No pains have been spared to make the work as nearly as possible exhaustive in its special province, and when we add to this that it is brought out by the publishers in thoroughly good style, it is clear that it must become the principal authority with all the members of the organization known as the Army of the Cumberland for its campaigns, marches, and engagements. Scarce a skirmish or a movement of a detachment, however small, is omitted ; the composition of the command, its corps, divisions, brigades, and regiments, are all given as they were originally made and from time to time changed, and a full appendix contains much valuable matter, including an illustrated résumé of the block-house system by which the railway bridges were protected on Sherman's long line of communications, and an extended list of the officers of all grades who were killed in battle or died of wounds. The book would therefore be a useful compilation of historical material, apart from the merits of the narrative.

* 'History of the Army of the Cumberland—its Organization, Campaigns, and Battles. By Thomas B. Van Horne, U.S.A. Illustrated with Campaign and Battle Maps compiled by Edward Ruger.' Two volumes and atlas. Cincinnati : Robert Clarke & Co. 1875.

The author's part of the work is creditable to him. He has devoted to his task the labor necessary to get a clear view of the movements and combinations of the troops whose story he is telling, and generally succeeds well in carrying his reader along with him, even in the intricacies of tactical movements of battles like Stone River and Chickamauga. His style is occasionally marred by turgid passages of attempted fine writing, but these blemishes are not frequent enough to detract much from the pleasure of reading the book. An introductory chapter gives the history of the political struggle in Kentucky which decided that that State should adhere to the Union, and of the events which soon put an end to the absurd attempt at neutrality which Governor Magoffin at first proclaimed Then followed the assignment of Gen. Robert Anderson to the "Department of Kentucky," the recruiting of loyal Kentucky regiments, the invasion of the State by the Confederate forces, and the successive appointments of Generals Sherman and Buell to the command of the Department.

It was under Buell's command that the organization afterwards known as the Army of the Cumberland took permanent shape, and his rigid ideas of system and discipline were soon impressed upon it, and made it from an early day one of the most compact and well-drilled bodies of troops in the Union army. General Thomas's connection with it dated almost from the very beginning, and his victory at Mill Spring was the most important of its early successes. Of course, the organization could not remain unchanged through all the campaigns of the war, but a sufficiently large proportion of its regiments remained connected with it to give fair justification to its historian for treating it as a unit and narrating the campaigns of all its parts, even when they were far separated from the Department and its commander, as in the case of the Fourteenth and Twentieth Corps, which made the march to the sea with Sherman. During that period General Thomas's actual command consisted of only the Fourth Corps of his original Cumberland Army, reinforced by the Twenty-third of the Army of the Ohio under Gen. Schofield, and the Sixteenth of the Army of the Tennessee under Gen. A. J. Smith, together with new troops and detachments of all sorts that were sent to his assistance. Yet so strong is the *esprit de corps* of the original organization that its historian attempts to follow the fortunes of its divisions, so widely scattered, and to give their history in detail. It is this feature of the plan of the book which makes it impossible that it should be in any sense a complete history, though it doubtless adds to its interest for those who regarded themselves as part of the Cumberland Army. So long as such a body of troops has a separate military work to do, its story may be written in a manner to make it a satisfactory integral part of the larger history of the war. But when the command was divided, and parts served in different campaigns, or when it became a component part of a larger army, as when it was the centre of Sherman's grand army, the attempt to write its history becomes most difficult, if not altogether impracticable. A unity is assumed when no unity in fact exists, and the best that can be made of it is to furnish material for a broader history, to be written from a standpoint which will enable the historian to group all the parts in fair proportion, and to free the picture from the color which a narrower view is sure to have.

The narrative may therefore be properly divided into two parts: the first covering the period in which the Army of the Cumberland was really a separate army engaged in independent campaigns, as during the time it was commanded by Buell and Rosecrans; the second period embracing the events in which it had only a share with the Armies of the Tennessee and Ohio. As to the first of these parts, the work of the author may be said to be complete, and his narrative to embody nearly all that any reader of history will need to know of the events described. The collection and collation of facts are painstaking and full, and the only criticism we are tempted to make is that a proper proportion is not maintained between great and little things. A trifling skirmish sometimes figures as a desperate engagement, and has a prominence which interferes with the grouping and composition of the work as a whole. As to the second part of the narrative in the classification above made, every real student of history will need to be constantly on his guard against the essentially misleading nature of a story in which the writer systematically gives overshadowing prominence to the part played by a fraction of an army, yet does not make his account the mere report of one integral part like a division or a corps. In trying to give enough of all that occurred to convey a tolerably clear view of a campaign, and yet to describe fully only what the portion known as the Army of the Cumberland did, the writer almost necessarily expands the excusable "quorum magna pars fui" of the Cumberland Army into an apparent claim to all the glory of every battle.

The most striking instance of this is in the account of the battle of Franklin, where the Confederate Army under General Hood was terribly repulsed by the National Army under General Schofield, the desperate nature of the contest being shown by the fact that in it Hood lost thirteen general officers killed and wounded. Yet the reader who should know that engagement only by Chaplain Van Horne's history would necessarily doubt whether the battle were anything more than an affair in which all the fighting on the Union side was done by one gallant brigade of the Army of the Cumberland. Of course, the reason assigned for this would be that the other troops belonged to the Army of the Ohio, and it is only the history of the Cumberland Army that is being written. In this case, however, the silence is so complete, and the extracts from official reports quoted as authority are so thoroughly culled of every allusion to the other forces, that the effect is altogether that of a garbled story, whatever be the reason or the motive.

Mr. Van Horne does not profess to give us much general criticism of campaigns, wisely limiting himself, in the main, to the narration of events as they passed. In the nature of the case, his work is strongly eulogistic. This spirit marks his treatment of the deposed as well as the successful leaders of the army. Buell and Rosecrans are alike right in all the controversies between them and the authorities at Washington. The former is justified in his retreat before Bragg, and the latter is said to have been forced to make the advance to Chattanooga with inadequate means and without real necessity. The standpoint is always that of one proud of the organization to which he belonged, and unwilling to see any but the side most flattering to it and to the leaders who were identified with its history. This could not well be otherwise, and we note it, not to condemn it, but to draw the line sharply between historical works of this class and the true history, in which the judicially impartial but equally well-informed historian shall take the larger view of events, and judge generals and armies from a standpoint which enables him to combine reasons of state with those of military necessity, and fully comprehend the relation of each army to the great common purpose.

*Prose Miscellanies from Heinrich Heine.* Translated by S. L. Fleishman. (Philadelphia: J. B. Lippincott & Co. 1876.)—In a small volume of three hundred pages, Mr. Fleishman has collected a number of interesting extracts from Heine's writings, which in no way cover the ground already occupied by other prose translators of that author, and only supplement the work that has been already done by them. The 'Reisebilder,' translated by Mr. C. G. Leland, gives but one side of Heine's complex character, while Mr. Stern's 'Scintillations from the Prose Works of Heine,' containing the 'Florentine Nights' and a number of examples of his wit taken at random from his writings, left comparatively untouched much of his more serious work. As Mr. Fleishman says in his Preface, "no writer better bears being quoted in brief, witty excerpts; yet none loses more by such treatment," and certainly no one comprehends all the charm and value of Heine's prose who only knows the extracted witticisms. In saying this we by no means condemn Mr. Stern's excellent volume, for it shows completely one of Heine's most fascinating sides—his boundless wit; but the editor of the volume before us to-day has added to the value of his book by giving us a chance to observe Heine's wisdom, which, be it said, was in no way devoid of wit.

The most important selections that the book contains are the condensed translations of the 'De l'Allemagne,' which treats of the history of religion and philosophy in Germany, and the admirable account of the Romantic School. Condensation was perhaps unavoidable, but we cannot help regretting that it had to be carried so far. The 'Memoirs of Herr von Schnabelewopski' might well have been omitted without harm to the book; its facetiousness is rather jarring than agreeable in English, and in its place we might have had a fuller translation of the Romantic School. It is a late day to call attention to the admirable way in which Heine wrote that chapter of literary history. Many long-winded German commentators and collectors of mouldy facts have toiled over the same ground, nearly buried beneath their learning, without half the insight of Heine, without half of his brilliant gift of exposition. Compare, for instance, Hayne's massive volume with these few chapters, and it is easy to see on which side the advantage lies—certainly not with the heaviest battalions.

Many of the 'Scintillations' are to be found in Mr. Fleishman's volume, but generally in their proper connection with other remarks; but even this last translator's more generous treatment does not satisfy us. Most readers would prefer to make their own condensations, and the asterisks which mark the frequent gaps are pretty sure to arouse the keenest curiosity about what has been omitted. Of Heine it is easier to give too little than too much. In addition to what we have already mentioned, the book contains his article on the pictures exhibited in Paris in 1831, that on the Suabian School, the Gods in Exile, and, in abbreviated form, his Confessions. This

selection, it will be seen, gives the reader opportunity to judge of Heine's versatility, and does not fall into the error of showing merely his brilliancy.

The introductory biographical sketch, based of course on Strodtmann's 'Life of Heine,' is of value. The critical part is interesting, but it fails, in our opinion, to give a complete explanation of the indifference towards him which is so common among the Germans. This cannot be ascribed wholly to his lack of moral character or to the frequent impropriety of his writings. These, doubtless, have had some influence; but the Germans are not more prudish than the rest of the world, and the English, French, and Americans have admired Heine warmly in spite of his obvious faults. His bitter attacks on Germany have probably had more to do with the coolness of their feeling towards him. He had a keen eye for the follies of his native country; he had certainly suffered severely from them, and he had a sharp tongue with which to rail at them. In this respect, his position is like that of Byron—neither is so much admired at home as abroad, and for the same reason: each of them attacked violently the ways of thought of his native land. Byron denounced England as the home of cant, and Heine was for ever ridiculing the political impotence of Germany and the tendencies of its writers.

Mr. Fleishman's translation is for the most part good. Objection must be made, however, to the use of such a word as *overly*, which occurs twice—namely, on pp. 68 and 267. In conclusion, it may be worth while to speak of the amount of attention Heine has received in this country. Besides the German edition of his works, in seven volumes, published by Schäfer & Koradi, of Philadelphia, which had reached its fifth edition in 1867, there are the translations we have mentioned. Moreover, it may not be generally known that the first translations of Heine into English appeared in this country, in a newspaper published in Newburyport, Mass. This was as long ago as 1830.

---

*Fragments of a Samaritan Targum.* Edited from a Bodleian MS, with an Introduction containing a Sketch of Samaritan History, Dogma, and Literature, by John W. Nutt, M.A., Fellow of All Souls' College, etc. (London: Trübner & Co.)—The existence of Samaritans at the present day deserves to be counted among the curiosities of history. A scanty remnant—barely more than one hundred souls—they still inhabit the ancient town of Shechem (now Nablûs), which was first settled by their ancestors more than two thousand years ago. They have outlived the persecutions of Jews, pagans, Christians, and Mohammedans. They continue to observe many of the ordinances of Moses's law which have fallen into disuse elsewhere. And the certainty of their approaching extinction lends an additional interest to a people whose early fortunes form a conspicuous link in the chain of Old-Testament history, and whose name has become a proverb through the parable of Jesus. Dr. Petermann, in his 'Reisen im Orient,' gives an interesting account of their rites and usages. The law of Leviticus xii., ordaining the separation of women after childbirth for thirty-three or sixty-six days, is still rigidly enforced. Twice in the year, sixty days before Passover, and sixty before Tabernacles, the priest receives the Terumah or heave-offering, while year by year the Paschal lamb continues to be sacrificed on Mount Gerizim. Petermann, observing that their women were generally without ear-rings, was informed that the use of these ornaments had been prohibited, because employed by Aaron in the fabrication of the golden calf. To Gerizim, their sacred hill, the chief events of the Biblical narrative, at least in its earlier parts, are referred. On or about it was the seat of Paradise, here Adam built his first altar, here the ark rested, here Abraham attempted the sacrifice of his son. Nor has it lost its importance in their eyes even at the present day. In 1858 they expected a great revolution to occur on earth, when dynasties were to be overthrown, and new empires to rise. Then, after an interval of ten years, the ruling sovereigns would assemble the wisest men of the earth in order to determine the true faith. Among these the Taêb (the Messiah of the Samaritans) would appear, convince them of his God-given mission, and lead the nations back to Gerizim. The vessels of the Temple would then be restored, the manna discovered, etc.

The attempt of the Samaritans to monopolize the consecrated spots of the religious past was dictated by jealousy of the Jews. Themselves the successors and, to some extent at least, the heirs of the lost Ten Tribes, they claimed to be the true Israel, the only faithful guardians of the Law of God, which they asserted had been falsified in Judea. They never recognized the Prophets and Hagiographa as canonical books. The Pentateuch, however, they have always held in great veneration. Indeed, their reverence for the books of Moses was so great as to extend even to the character in which they were written. When the more archaic Hebrew character was abandoned among the Jews, it was preserved in the scrolls of the Samaritans, and, being thus transmitted to our own day, has served to interest scholars in their literature. But the pious zeal with which the Samaritans guarded the written form did not ensure them against forgetting its meaning. The language of the Law soon ceased to be understood among the vulgar, and it was found necessary to translate it into the Samaritan dialect.

Probably in the third century A.D., at or about the same time that the Chaldaic version (Targum) of Onkelos was fixed within Jewish circles, the Samaritan Targum was written down. To Mr. Nutt we are now indebted for the publication of a fragment of this Targum, from a MS. in the Bodleian Library at Oxford, older than either the Barberini or Vatican MS. at Rome. It embraces the end of Leviticus from chap. xxv. 26, and the Book of Numbers, with considerable breaks in various places. "It is to this Targum," says Mr. Nutt, "that recourse must principally be had for settling the forms of the Samaritan language. . . . It is of considerable importance, therefore, that we should possess a thoroughly critical edition of the text, and it is as a contribution to this end that the present fragment has been edited." 152 pages of the book are devoted to an introduction on the history, doctrines, and literature of the Samaritans. In the second part, the connection shown to subsist between Samaritans, Sadducees, and Karaites will be found of special interest. An account of the Hebrew-Samaritan Pentateuch, the Targum, the Samaritan-Greek version, the Arabic version of Abu Said, the Samaritan Chronicles, etc., is given in the third part. The whole essay is a complete and careful reproduction of the results of Samaritan research, which are presented with singular clearness and accuracy. Perhaps the statement on p. 19, concerning the lighting of sham beacon-fires by the Samaritans, should be received with some caution. On comparing the source from which this statement is drawn with collateral passages of the Talmud, it appears to us more likely that the term "Cuthim" is employed in the instance referred to as a disguise, and that the sectaries referred to are in reality the early Christians.

The value of the volume is enhanced by two appendices. The former contains an account of the Firkovitch collection of Samaritan MSS. at St. Petersburg by Dr. Harkavy. The enthusiasm with which these treasures are announced would be more cordially appreciated if grave suspicions had not lately fallen on the genuineness of some of Firkovitch's discoveries. The second appendix embodies an English rendering of the 'Tract on the Samaritans.' We are glad to notice that the Introduction to the Targum is also to be sold separately. The interest of the latter appeals solely to the narrow circle of Semitic scholars. The former may be read with profit by all who are interested in the phenomena of religious history.

---

*Lectures on Dendrology.* [Vorlesungen über Dendrologie. Gehalten zu Berlin im Winterhalbjahr 1874–75, von Karl Koch, Med. et Phil. Dr., Professor der Botanik an der Friedrich-Wilhelm-Universität zu Berlin.] (New York: L. W. Schmidt. 1875.)—This is an unfinished course of lectures given last winter in Berlin by Professor Koch, of the University. It is by no means so restricted in its range as the common definition of dendrology might indicate; it comprises much more than the natural history of woody plants. The course is divided into three parts. The first gives a popular history of the garden and of landscape gardening; the second deals with the structure and life of trees, and the relations of trees to hygiene and climate; the third with a single family of woody plants, the *Coniferæ*. It will be seen that the claim made by Professor Koch, that dendrology is not a narrow and one-sided science, is well supported by the comprehensiveness of the present treatise. The subject is presented in a very interesting manner. Its technical character is relieved throughout by the introduction of bits of curious information, which have evidently been subjected to most careful scrutiny. A few of these may be new to many of our readers, and we therefore transfer them in a condensed form.

Only a small proportion of the hardy shrubs and trees growing in the open air in Germany are indigenous there; North America has contributed a far larger number; then follow successively Siberia, the Caucasus, Southern Europe, and the Orient. In a few favored localities in the South Rhine there are now some shrubs from the Terraces of Mexico, and even Peru and Chili. Of the sacred trees the author has much to say. He states that the oldest European nations revered the oak; the Germans the linden, making it the gathering-place of their sacred tribunals. It was not until the middle of the last century that the oak was adopted as the symbol of German power. The Northern people regarded the birch as sacred, but in the South of Russia its place was taken by the pear-tree. In the Himalaya

the cypress (*Cupressus religiosa*), the juniper (*Juniperus religiosa*), and the cedar (*Cedrus Deodara*) surround the temples. South of these mountains, the banyan (*Ficus religiosa*) supersedes the conifers just named. The ancient inhabitants of Egypt and Nubia revered the sycamore; by the Christians now living in those countries it is known as the tree of the Madonna. The sacred tree of South Africa is the gigantic Baobab (*Adansonia digitata*); in Teneriffe, a dragon-tree was regarded as sacred.

Long before the time of laying out walled gardens and cultivating in them plants for their flowers, the rose appears to have been widely planted. Each of the four great Asiatic groups possessed a rose of its own and carried it throughout its wanderings, until, finally, all four became the common property of the four peoples. The great Indo-Germanic cherished the Hundred-leaved rose (*Rosa Gallica*), but later, among the Germans, *Rosa canina* played an important rôle. The sacred rose of the Semitic, or Arabic, people was the Damascus, and perhaps the musk-rose; the Turkish-Mongolian division cultivated the yellow rose (*R. lutea*); Eastern Asia, probably China and Japan, is the native land of the so-called Indian, or tea-rose. In very early times it was carried to the East Indies; and as it was found there first by Europeans, it has received the erroneous common name of Indian rose. The author says that the roses which bloom many times in the year (the Remontant roses) are the product of comparatively recent horticultural art.

The employment of "weeping trees"—those with pendant branches—near burial-places is with us of recent origin. We have received the custom from China, where, from early times, a weeping cypress has been cultivated. Two weeping willows also are extensively planted there, not only at graves but in pleasure-gardens and parks. One of these was early introduced into Europe by way of the Orient, and it was assumed by Linnæus to be the tree under which the Jews, in their Babylonish captivity, sang their songs of sorrow, and he gave it therefore the erroneous name, *Salix Babylonica*, which it has since held.

Professor Koch's history of the garden among the ancients, and his account of the changes through which the garden has passed in its development, are full of interest. He finds in the style of gardening an expression of the national character, and he traces the modifications of the style with great skill. He is much perplexed, however, by the present character of Chinese pleasure-gardens. They resemble the free, wide parks which form such an attractive feature in England, and the Celestials have possessed such gardens for centuries. It is difficult, our author thinks, to explain this anomaly of free parks in an unprogressive and pedantic nation like the Chinese, except on the hypothesis that this people must have had a period of free thought at some time far back in their history. In Japan great parks appear to be wanting, and their gardens differ in other points from those of China. Horticulture is thought to be much older among Japanese than the Chinese, and to have exercised an important influence upon the latter. We do not find, however, that Professor Koch makes this clear. The gardens of the Greeks and Romans, those of the Italians of the middle ages and of the present day, French and Dutch gardens, are treated of in much detail and in a philosophical manner. We must express a hearty wish to have this course of lectures, together with those promised for the present winter, soon given to us in an English translation.

# The Nation.

*NEW YORK, THURSDAY, DECEMBER 30, 1875.*

## The Week.

THE interval between the adjournment and the assembling of Congress is being mainly occupied with hints and prophecies as to what it will do on reassembling. There seems to be a general feeling among the Democrats that great caution and unity of action will be essential for them, and for this purpose it will probably be necessary for the majority to be managed by a caucus in all important matters. The Republicans are rather exultant at the signs of dissension in their opponents' ranks caused by the appointment of the committees, and it is amusing, when we remember what material the Republican Congresses used to be composed of, to see the veterans shaking their heads at Mr. Kerr's unpractical disposition and the want of experience of many of his appointees. As regards the chairmanship of the Committee of Ways and Means they are especially disappointed, and point out with great force that the choice for so important a position ought to fall upon a man not merely able and upright, but an experienced debater, a thorough parliamentarian, a man completely conversant with the actual condition of business and the national finances, as well as the needs of the country. In short, he should be a statesman. A man with all the best qualities of Hamilton, Webster, and Turgot united would not be a bit too good for the place. The Democrats, we suppose, comfort themselves with the reflection that though this is the kind of man the Republicans may have meant to put in, the choice, for some reason or other, used to fall upon Schenck and Dawes. Among the things intended by the Democrats for the winter's campaign is said to be the revivification of the Committees on the Departments. They have been merely nominal for the last fifteen years, and have exercised no check on expenditures, but, belonging to a hostile party, they will now be made more energetic and inquisitive.

---

The general order of the President to "let no guilty man escape," however it may have been violated in some quarters, has been carefully obeyed by the press. The Chicago *Inter-Ocean* has, it pretends, recently become possessed of certain facts tending to prove that the head of the Whiskey Ring is not MacDonald or Joyce or even Babcock, but the Secretary of the Treasury himself, and with a commendable zeal has published them, evidently resolved not to screen the guilty, however high their position. Its "facts" are: 1st, that Bristow's brother-in-law's brother, one Weller by name, is a Louisville whiskey-dealer and rectifier; 2d, that Bristow when he goes to Louisville always stays at the house of his brother-in-law; 3d, that when he goes to Cincinnati he stays with one Hobart, "connected" with "one of the largest whiskey-houses" there; 4th, that before Bristow became Secretary of the Treasury he was counsel for Cunningham & Co. of Louisville, and in that capacity asked the Chicago district-attorney to release some whiskey of theirs which had been seized by the Government, and that after he became Secretary the whiskey was released. With regard to the first charges, we are sorry to say that the Wellers deny that the Secretary makes his home with either of them, but, on the contrary, goes to the Galt House; while the brother-in-law's brother says that he has been prosecuted by Mr. Bristow. As to the Cunningham seizure, it seems that Mr. Bristow had nothing to do with the release, declining to interfere on the ground that he had been counsel. This still leaves open the question, however, whether he "stays with Hobart" when he is in Cincinnati. This a Congressional committee would no doubt be able to discover. No tribunal, however, short of a court of law will be able to clear the Secretary of the charge that his brother-in-law's brother is a "whiskey-man."

The action of Governor Chamberlain in refusing to commission Whipper and Moses has led to an open breach between himself, backed by the conservative, taxpaying part of the population, and the corrupt and shameless organization which goes by the name of the Republican party in the State and controls the legislature. The legislature is greatly disgusted at finding that the Governor means to put a stop to corrupt legislation by vetoing improper bills, and to bring the government of the State back into the hands of the property-owning classes. The message of the Governor, sent to one of the New England dinners last week, calling upon the Puritan to unite with the Huguenot to put down evil-doing, has not a very peaceful sound, and, if it were not for his own good-sense and that of his followers, as well as the fortunate absence of a meddling temper at Washington, we might have had bloodshed before now. It has been clear for some time that the present condition of South Carolina—with half the State going under the name of "Conservatives" because they prefer to keep their property, and the other called "Radicals" because they want to get it away and have actually got a good deal of it, and these Conservatives all belonging to a superior race, embittered against the other by misgovernment and despising it at the same time—could not last for ever, particularly now that the State is surrounded with other communities which have been through the same troubles, and in which the whites have come out victorious.

---

A bill has been introduced in the California Legislature providing for the punishment of wife-beaters by flogging, and it will probably attract the unfavorable attention of humanitarians. The whipping-post and pillory in Delaware have been supposed, by that large class of people who may be said to be interested in the abolition of pain, to be a relic of the brutal past, and they will probably raise an outcry against the proposed legislation in California. There are, however, some things to be brought forward in favor of flogging, the chief of them being the evidence of the English judges, who have found it on the whole useful for that class of crimes which are accompanied by gross brutality. Of these wife-beating and garroting are of course signal instances. It is a curious fact, by the way, that the law, with all the tenderness it has developed for inhuman wretches who torture their unfortunate victims for money or for the mere pleasure of the thing, still retains a Roman severity in the case of children, and allows their flagellation by parents in the interest of good morals and education, while it shudders at the thought of a flogging being given to a poor fellow who first beats his wife nearly to death and then pours camphene over her naked body and sets fire to it. It may be a good thing to reserve the right to beat children and a bad thing to flog anybody else, but it should be remembered certainly that the right of flagellation is not by any means a right without legal recognition.

---

Philologists, and the multitude of unscientific people who take an interest in the growth and changes of the meaning of words, will be interested in reading the testimony taken by the Canal Commission in the case of Auditor Thayer. To "audit" bills no doubt originally meant to investigate the merits of a bill on behalf of the person or corporation against whom it was presented, and to decide whether it ought to be paid or not. An "auditor" was one who performed this duty. From the testimony given by Mr. Thayer, however, it seems that in what may be called Canal circles the word to "audit" now merely means to see that the bills are in "proper form" and "genuine," or, in other words, not forgeries, and an "auditor" is an officer of state who, after first satisfying himself on these essential points, buys the bills up himself at the usual

market rate. This is what Mr. Thayer has been doing, and his motives, according to his own account, are the same as those which have led to recent modifications in the meaning of a good many political and legal terms—a desire to prevent stagnation in trade, and to keep the crops in motion between the wheat-fields of the West and tide-water. He further says that he made no money by his transactions, and declares himself under the impression that he simply was discharging the duties of his office. It is another case of what Mr. Dorsheimer calls the "common law of the Canals." Nevertheless, Governor Tilden has suspended Mr. Thayer.

Mr. Henry C. Bowen of the *Independent* has recovered $1,000 in his libel suit against the Brooklyn *Eagle*, so that, as he laid his damages at $100,000, he has lost $99,000 on this one transaction. At this rate, two or three libels might reduce him to a condition of very moderate wealth. We observe also that, in another suit, evidence has been taken by commission, in Philadelphia, touching the contract between Mr. Bowen and Jay Cooke & Co., of which we spoke a year ago, to puff the bonds of the Northern Pacific Railroad in his "money and editorial columns," in return for heavy payment in stock and bonds of the road. Mr. Bowen's denials about this contract at the time were very painful to us, as coming from a gentleman who paid so large a sum for his pew in church. Mr. Lewis, the assignee of Jay Cooke & Co., has now been examined, and has testified to the existence of the contract, and to the receipt by Mr. Bowen of advances made on account of it. We would now, at the close of the old year, and in this period of moral confusion and uncertainty, earnestly urge subscribers to religious papers to ask themselves the following questions, and to try to answer them: Is there any necessary connection between religion and morality? If so, what connection? Should a religious man be moral? Should a religious paper be moral? Are not the scandal and evil of immorality on the part of a religious teacher greater than those of immorality on the part of other people? Is it right to encourage immoral religious men, whether teachers or not, in occupations tainted with humbug? Is not the Christian the natural foe of humbug? Is it not part of the mission of Christianity to put down humbug in every department of life? It is only after having cleared his mind thoroughly on these points that a man should renew his subscription to his religious paper and draw his chromo or his pair of suspenders.

The "Plymouth Church troubles" are still raging. Mrs. Moulton and the church are to call a mutual council to discuss their differences, having at last agreed on the matter and form of the questions to be submitted to that body. Plymouth Church, on its side, has called an advisory council to discuss on general grounds whether its discipline is or is not in conformity with Congregational usage and principles, but has been induced, or has consented, to postpone the meeting of this council until after the mutual council shall have finished its business. How it will all end it would be hard to say, but it is safe to predict that it will not end soon. Mr. Beecher's tone at the church meetings is defiant and combative of late, and shows little trace of the attitude of Christlike silence and resignation which he assumed when he came back from the mountains. He is not willing to be tried over again, he says, by ministers, for the very natural—and we must say, as it seems to us, strong—reason that they have neither the time nor the kind of experience to try the case fairly. Brother Shearman has resigned the church clerkship, receiving from Mr. Beecher in open court a certificate that he is a truly good man, in spite of all the newspaper charges against him. In the meantime, Moulton has begun a suit for malicious prosecution against Mr. Beecher which promises to reopen the whole question of the latter's guilt or innocence.

The New York *Commercial Bulletin* gave recently, apropos of the President's anxiety, expressed in his message, about the effect of a continuance of the Cuban insurrection on American commerce, some curiously instructive figures, from which it appears that, when he declared that the interests of commerce might call for some kind of interference with the belligerents, he really had not considered what he was saying. Indeed, it would appear from the Custom-house returns that the continuance of hostilities in the island was, on commercial grounds, a thing rather to be desired than deplored. Here is the table; we wonder whether the President did not ask General Babcock for it while he was writing the message, and whether Babcock, in the bewilderment of his whiskey troubles, did not forget it:

EXPORTS FROM THE UNITED STATES TO CUBA.

| | | | |
|---|---|---|---|
| 1873–4 | $19,597,000 | 1870–1 | $14 200,000 |
| 1872–3 | 15,23[illegible] 000 | 1869–70 | 13,091 000 |
| 1871–2 | 13,168,000 | 1868–9 | 12,643,000 |

IMPORTS INTO THE UNITED STATES FROM CUBA.

| | | | |
|---|---|---|---|
| 1873–4 | $86,272,000 | 1870–1 | $58,240,000 |
| 1872–3 | 77,469,000 | 1869–70 | 54,056,000 |
| 1871–2 | 67,720,000 | 1868–9 | 58,201,000 |

It always, and for good reasons, happens that the last two weeks of the year are characterized by dulness in wholesale trade; the past week has been no exception to the rule. In Wall Street there has been little life in any market. Gold has declined further, and, contrary to expectation, so has sterling exchange. It was reasonable enough that gold should fall, as the Treasury on Monday began the prepayment, without rebate, of semi-annual interest on about $830,000,000 of debt, or, to be accurate, of $25,039,734 50 gold interest. Of this interest, $10,699,343 50 goes to holders of registered bonds, and the remainder to the holders of coupon bonds. This interest payment, at first glance, seems large when the amount of bonds called in for redemption is remembered; but the bonds called were entirely of the class on which interest is due in May and November. The quarterly interest on the new fives, issued in place of the 5-20 6 per cents, does not fall due either in January or July. Lower gold usually stimulates a demand for sterling, but, strange to say, rates for the latter have declined, the explanation being that a large amount of sterling was borrowed by speculators in stocks and was turned into gold, and then into currency, for the purpose of making the borrowers secure in their loans during the time which they calculate their speculation in stocks will cover. Excepting this supply of bills, which was ample, there were no bills except those made against cotton, and a very small amount against provisions. The money market has been fully 7 per cent. for demand loans, although higher as well as lower rates have obtained at the Stock Exchange, according as special influences were used in the loan market there. The banks gained in surplus reserve, by reason, however, of a reduction in liabilities, since the total reserve was actually less in amount than the preceding week. The banks will undoubtedly lose more currency before the tide turns in favor of New York, but it now seems likely that their gains in gold will exceed these losses.

The English mind is still greatly occupied, and with much irritability, over the late accidents to the ironclads, and over the exceeding delicacy of structure and arrangement which these accidents reveal. The prospect is at this moment that the policy of building great ironclad ships will be totally abandoned, and the fleet reconstructed of smaller, simpler, and more easily handled vessels, which will rely largely on quick manœuvring and ramming power. The ease with which a first-class ironclad gets out of order, and her utter helplessness and uselessness when she is out of order, have alarmed people. The condition of the army, too, is not satisfactory. The present pay and bounties do not bring in the old class of men, such as fought on the Alma and perished in the trenches before Sevastopol, but a younger and feebler class, who desert or break down much more readily. The Duke of Cambridge acknowledged as much in a speech the other day, and the public mind is filled with schemes of reorganization, all of which are of doubtful practicability and must involve a heavy increase of expenditure. The loss of Ireland as a recruiting field, owing to the diminution of the population, and the increased comfort of what there is, has greatly changed the military problem for the British Government since 1800, and yet England has since then grown in population and

resources far more in proportion than the enemies she then engaged; on the other hand, there are more first-class powers to be reckoned with than there were then.

---

The French Ministry are making the unfortunate mistake of trying to embody in a bill introduced by M. Dufaure the worst restrictions ever imposed on the French press. The number of things forbidden to journalists is so great that ordinary political discussion would be impossible under the proposed law without leaving the editor at the mercy of the authorities, which is in fact the position in which M. Dufaure avowedly seeks to place him. The worst of it is that no party has as yet appeared in France able and willing to oppose legislation of this kind on principle. Each opposes it when introduced by its enemies, but is quite ready to resort to it itself whenever it gets into power. The French press is in reality no more unfair or passionate in its treatment of either men or measures than the press of this country, and does not approach in scurrility the "reform press" of this city during an exciting canvass. If there be any excuse for the harsh treatment with which nearly all French legislators like to visit it, it is to be found in the character of the people, who are very sensitive to abuse, and the remedy for the license of the press would seem to be in letting it loose until the public learn not to heed it. If, for instance, a man in Mr. John Bigelow's position in France had been told by a Paris paper, when a candidate for office, as Mr. Bigelow was told by the New York *Times*, that he had "betrayed every trust confided to him," he would never have rested day or night until he had got some satisfaction, and the public would have sympathized with him, and French society would have been convulsed over the incident. Here, on the other hand, Bigelow laughed, and his friends laughed, and the whole thing was forgotten by the public in twelve hours, and probably is now forgotten even by the editor of the *Times* himself. We do not mean to say that this is an admirable state of things; in fact, it is in many respects disgusting; but the evils of a licentious press are on the whole, as far as the community is concerned, vastly less than those of a well-policed press. The French Press Bill is treated by the Ministry as an essential preliminary to the raising of the state of siege in certain Departments.

---

The Germans have been busy discussing the budget for the coming year, which is both an encouraging and annoying document. The Government, it ought to be observed, maintains under the new régime its old habit of prudence, and underestimates the receipts and overestimates the expenditures, and puts away all surplus as savings, and not to be drawn on. The estimates for the coming year report a deficit of nearly $5,000,000, of which the Liberals deny the existence. For instance, the Navy Department figures as requiring 31,000,000 marks, when it really has an accumulation of 48,000,000 marks, composed of the unexpended balances of former appropriations in the treasury. Then, too, although hardly any of the French indemnity has been devoted to civil purposes, the Government is calling for fresh appropriations for new staff-officers, for the construction of new barracks, for the fortification of Strassburg, for the increase of the War Fund and of ready money constantly kept in the treasury, and for the expenses of the alteration of coinage. The Liberals, however, are now disposed to insist on an abandonment of the old military mode of estimating, and on the adoption of the parliamentary system of close adjustment and of greater consideration for the taxpayer. They think the present extraordinary demands of the Government should be met by loans, and the burden thus distributed over a number of years; that the accumulations in special departments should be treated as liable for current expenses; that the French indemnity should be made to meet the expenses of recoinage; and that the Government should place more reliance on the yearly revenue, and on the elasticity of the resources of a free people, and on their credit for the meeting of emergencies, and less on the semi-barbarous practice of hoarding, begun when Prussia was a poor country, without commerce or manufactures, and surrounded by enemies and often compelled to fight for her life.

---

The substance of the Papal reply to the Spanish note asking for a modification of the Concordat has been published, and is thoroughly insolent and contemptuous. It sets out by declaring that the Concordat ought not to be modified in any particular; that the Holy See is willing to help Spain, but only on condition that the "Sacred Knot" shall remain unloosed. It must be remembered that the "Sacred Knot" gave the bishops almost complete control over education, the press, and public worship. The note then, in a tone of pity, however, says that if the Spanish Government cannot help itself the Pope will look into the matter, and see whether he can do anything for its relief, and will, with that view, examine the new constitutional scheme; and, as King Alfonso expresses a desire to be on terms of cordiality with the Holy See, his Holiness is willing to reciprocate. The preparations for the final assault on the Carlists in the meantime continue, and a larger force than ever will probably "force the fighting" in the early spring, and this the rational portion of the Spanish people doubtless consider more important than the Pope's views about the Concordat. Don Carlos, on his side, has prepared for the fray by issuing the most magniloquent of all his proclamations, promising his troops plenty of fighting, of suffering, and of glory, and calling Alfonso a "rebel prince of his family." The manifesto has, however, been coldly received, and will probably do little for the resuscitation of the cause.

---

The constitution granted last year by the King of Denmark to his Icelandic subjects materially changed the character of the Althing, or National Assembly—first, by substituting two houses for the single house of the old Althing; and, secondly, by conferring upon the new body legislative powers and complete control of the island's finances, in place of the merely advisory functions exercised by its predecessor. The first session of the reconstituted Althing began at Reykjavík July 1 of the present year, and ended August 26. The Lower House after organizing selected by ballot 6 of its 36 members to form, with the 6 deputies appointed by the Crown, an Upper House; thus making the upper branch to consist of 12 members and the lower of 30. Jón Sigurdsson, the distinguished leader of the Liberal party, was chosen presiding officer of the two Houses when in joint session and Speaker of the Lower House, while the Bishop of Iceland, Pétur Pétursson, was elected President of the Upper House. In the course of the session 16 bills were introduced by the Government, of which 11 became laws; and of 37 originating in the Houses 15 were added to the statute-book. Among the more important legislative acts were the budget for 1876 and 1877—the sessions of the Althing are held every other year—and laws systematizing the salaries of officials; regulating emigration; guarding against the introduction of epidemics; encouraging the construction of roads; enlarging the medical school at Reykjavík; and imposing duties on spirituous liquors and tobacco. An address to the King was voted, and joint resolutions were passed urging upon the Government the necessity of submitting a general school law, of promoting steam navigation between domestic ports, and of a revision of taxes; commissions were also appointed to prepare a plan for the establishment of a law school and to investigate the subject of tariffs and duties. The proceedings in general indicate that the practice of self-government secured by the new fundamental law will lead to important and beneficial results, and that the island enters upon its second millennial period under very favorable auspices. The only stormy debate which occurred during the session had reference to what is known as the "fjárkládi," an epidemic which has raged among the sheep of Iceland for several years, greatly to the injury of the island's principal industry. The Reykjavík journals of October 18 chronicle the arrival of the bronze memorial of the sculptor Thorvaldsen, voted last year by the municipality of Copenhagen to the municipality of Reykjavík; it was to be set up, on a pedestal already prepared for it, in one of the squares of the latter town.

## THE PURITANS AT THE SOUTH.

WE are sure the sympathy of honest and patriotic men all over the country will be given to Governor Chamberlain in his struggle with the corrupt and unprincipled majority of the South Carolina Legislature, for, as he telegraphed to the New England Society of Charleston on the 22d, it is the cause of civilization which is now at stake in that as well as in some other Southern States. The bold defiance to decency and morality displayed in the election of Moses and Whipper to two unexpired judgeships really does show that it is civilization itself which is in peril in some of the debased democracies of the South. For the shameless indifference to public opinion which has made possible in South Carolina the selection by the legislature for judicial functions of two notorious reprobates, bankrupts, and defaulters—one of them a rascally white man and the other an ignorant and vicious negro—the Republican party at the North is in a great degree responsible. This cannot be repeated too often, and cannot be remembered too faithfully, because we doubt much whether the public mind at the North is yet fully alive to the real nature of our responsibility towards some portions of Southern society. The President may be safely taken as a fair representative of the average man, and he has waked up, as is seen in his last message, to the dangers with which unintelligent suffrage threatens the country. With his anxiety on this point nobody can find fault, but when he comes to talk of the remedy, and finds it simply in common schools and unsectarian literary instruction, he shows that, like so many of the body he represents, he does not fully understand the evil which he is discussing, for the common schools do not and never can give children either their moral or political any more than their religious training. They put in their hands the means of acquiring a certain amount of moral and political training by teaching them to read and write; but this is all they do or are ever likely to do. The notions of right and wrong, of the expedient and inexpedient—the main features, in short, of the code by which conduct is regulated, are learnt by the great bulk of the youth of the country from their social surroundings and their own experience of actual life. The attachment of the body of the people to republican government, for instance, is not due to what they were taught at school about republican government, for they were taught little or nothing at school, but to their own experience of its working. A boy learns respect for the authority of the majority not out of his political catechism, but from what he sees of the mode in which this authority is created and exercised. His respect for the law, too, is derived, not from treatises on government, but from his knowledge of the men who make the laws, and of their working after they are made. Nor would it be possible to counteract, by any amount of preaching or literary instruction, the impression about the judicial character and functions which a young mind gets from observation of the judges themselves, and from observation of the estimation in which they are held by the public. No greater misfortune can happen a young man than to grow up in a community in which justice is bought and sold, and its dispensers are treated in common parlance as knaves and embezzlers. His education with regard to certain fundamental social ideas is, and must remain for ever, fatally defective, in spite of all books and teachers can do. We doubt if it be possible to overestimate the moral and political injury done to the generation which was coming on the stage of affairs in New York during the years when Barnard and Cardozo and their confederates were on the bench, and Shearman and Field were using them in the service of Fisk and Gould, and the press was ringing with denunciations of the whole gang. Hundreds, if not thousands, of young men who will play or are playing prominent parts in life will never get over the effects of seeing what those judges did and hearing the way in which they were spoken of. The youth must have been more than ordinarily endowed by nature whose very ideal of Justice herself, or at all events of the possible limits of her rôle in this world, was not fatally injured by the experience of those years.

It was the forgetfulness of the Northern public, and especially of the Republican party, of this educational influence of the mere phenomena of political and social life, that led to the recklessness of much of the legislation and of more of the administration of the Reconstruction process. People forgot how much the colored voters had to learn, and how rapidly they would learn something or other, and how important the way in which they learnt and the things they learnt were going to be both to the South and to the nation at large. The notion that the use of the ballot itself would bring the knowledge how to use it was perhaps, under all the circumstances, excusable, though it was drawn from the experience of races two thousand years in advance of the Southern freedmen. But there was no excuse for supposing that it would bring this knowledge without the aid of sound social and political influences. People learn the proper use of the suffrage at the North surrounded by a highly civilized community; by officials who, if not all they ought to be, are on the whole honest and respectable; and by judges whose integrity nobody doubts; and by a public opinion which, on the whole, works for righteousness. The negroes at the South had none of these aids; they began their political life in a country desolated by war, and in the midst of a social disorganization so great as to threaten civilization itself with extinction.

At this point the North intervened. It ought to have intervened with all the best influences and agencies within its reach. Its resistless force, in which the freedmen saw the very finger of God, ought to have been wielded by what was best and purest in Northern society. The work of setting the political machinery in motion ought to have been entrusted to the most upright and intelligent functionaries and administrators the free States could produce. More solemn work than the work of Southern Reconstruction no people were ever called on to perform, and it ought to have been performed by the wisest heads and cleanest hands we could get. Instead of which we proclaimed to the country, by our legislation and administration, that here was a chance for defaulters, embezzlers, cheats, vagabonds, and forgers. We gave office then to men to whom we dared not give office at the North, much as the North will stand in the way of official impurity. We made it known that, let the excesses of the men whom we armed with power be what they might, their victims should have no redress in this world. We asked for abject, blind, and silent submission to the meanest, most sordid, and degrading tyranny ever set up in any age or country—the tyranny of feeble and ignorant knaves. The result was a social and political system such as the world has perhaps never seen, in which the forms of constitutional government, and the processes of law, and the emblems of power in its most legitimate and august form, were used to cover petty and grand larceny, embezzlement, forgery, and resistance to the police.

It was thus the school was furnished in which our colored voters learnt their first lessons in politics. The United States appeared on their horizon, at the dawn of their political life, as a power which furnished artillery to bands of burglars whenever people defended their houses too stoutly. It is not wonderful, then, that their notions of government should be so confused, and so corrupt, that Governor Chamberlain's principal duty seems to be that of a detective watching a lot of "cracksmen" and trying to counteract their various schemes of robbery. There is to us something profoundly melancholy in that despatch of his in which he calls for a fresh display on the part of the New Englanders in South Carolina of the old Puritan "spirit of undying, unconquerable enmity and defiance to wrong" at this crisis in the history of the State. The old Puritans showed their mettle and formed their character in conflicts with what was highest and mightiest and most respectable in the civilization of their day. They contended on flood and field with "gallant men and cavaliers," with kings and priests and nobles, with the strongest faiths, the oldest prejudices, the loftiest pride, and the most revered customs the world had to show, and with a fortitude and heroism worthy in all ways of men who sought to establish the kingdom of God on earth. But the tracking of criminals, the work of bringing thieves and pickpockets and highwaymen to the gallows and the cart's-tail, the defence of the public

treasury against forgers, and the exclusion of defaulters and embezzlers from the judicial bench, they never dreamed of as any part of their mission. When a man of Governor Chamberlain's standing has to appeal for the execution of tasks of this kind to the spirit which brought Bradford and Winthrop and Endicott over the sea, and closed the ranks behind Cromwell at Naseby, it must be confessed we have fallen on evil days. And yet the days are not so evil as they seem. American civilization may be threatened by many perils, but assuredly it is in no danger of being overthrown by jail-birds, and, bad as the condition of some parts of the South may seem, four years of a pure, high-toned, energetic, and conscientious Administration in Washington, with its face set like flint against peculation and corruption, with neither quarter nor protection for adventurers, jobbers, and intriguers, with cordial social and political relations with the best portion of American society—best, we mean, in regard to morality and intelligence—would break up the corrupt element in Southern politics without any difficulty, and if it did not turn the steps of the negro voters into the paths of honesty and economy, would at least fill them with the respect for character and ability through which, if the South is to be saved, its salvation must come.

## THE REDUCTION OF THE ARMY.

THERE are certain national affairs, the tariff being a conspicuous example, which have always served as Congressional foot-balls, to be bandied to and fro—as an index of the strength of party ranks or of the skill of party leaders—and which, as soon as they have reached a goal, are again carried into the arena to be struggled over by new sets of players. From these contests the buffeted object always emerges more or less damaged, and the winning party, caring nothing for the symbol that it has borne before it, and little for the principle, if haply a principle there be, involved, flings aside the somewhat mutilated trophy for which but a little while before it was hotly contending. One of these playthings is the Army, to the treatment of which we invite attention.

The dread of a standing army as a menace to constitutional liberty manifested itself with our English forefathers in the yearly re-enacted and annually expiring Mutiny Act, which for so many years, we might say for political ages, has given the military force of Great Britain its legal existence; and found expression in the Congress of the Confederation, at the close of our own Revolution, in the disbandment of all the Continental forces except, literally, a few dozen men to guard the ordnance stores at Fort Pitt and West Point. That dread, although not always clearly defined as an article of political faith, coupled with the notion that an army is "aristocratic," and therefore unrepublican, and is costly, and therefore should be suppressed, has tinctured popular feeling to the present day. Many of the Congressional debates and the statutes growing out of them affecting the military force, form a curious medley of unwilling and often ignorant legislation. To this very point one of the few traditional witticisms of Washington bears witness. It is said that it was proposed in the Convention to limit the army to five thousand men, when he offered the additional clause, "and no enemy shall invade the United States with more than three thousand men." In April, 1861, the army consisted of nineteen small regiments. In 1866, the peace establishment was fixed at 50,000 men; in 1869, it was reduced to 30,000, and in 1874 to 25,000 men. A vigorous effort will be made this winter to effect a further heavy reduction under the plea of economy.

In the eyes of politicians, it would be childish for the army to revive the vows and pledges written on the sands of popular feeling in the frightened days of '61. The handful of regulars at Bull Run, Wilson's Creek, and Fort Pickens in 1861, and on the Peninsula and again at Bull Run in 1862, who, as they stemmed those floods of fire, indicated what an army corps of such troops would have been worth, established no claim of which their survivors and successors can show the bond. But until the millennium introduces unerring judgment as well as perfect morals, armies, equally with courts of justice, will be necessary agents of governments. And with these, as with women, to be respected they must be good. To be effective, an army must be able to discharge its ordinary duties thoroughly, and must have a reasonable reserve with which to respond to demands of emergency. It is the unexpected that happens and for which we should be prepared. But, unfortunately, where danger is prospective, present cost is apt to outweigh future advantages. The standing army has probably never been in excess of the current requirements of the country, and its muster-roll now is but a trifle larger than when the rebellion arose. No one doubts the impulse given to secession by the occupation of the empty or feebly garrisoned forts, and yet at this day about eighteen hundred men hold the seaboard from Eastport to Pensacola. It is true that no new rebellion is to be apprehended, but it is equally true that the forts were built for a purpose, and that the men in each harbor are barely enough to guard the guns decently from petty thieves of old iron. The condition is the same upon the Lake region. Except the artillery just referred to, the nominal peace establishment is really occupied with chronic war. Probably not a dozen of the trans-Mississippi garrisons have not been engaged in actual hostilities within the last ten years, often on the briefest warning. As we have pointed out in discussing the Indian question, the ability to compel peace is an important element in its preservation. To display that ability requires every available carbine and rifle. But vexatious and harassing as are the savage troubles, there is plainly other work that may engage the troops. In 1866, with many more disposable battalions, the Fenian flurry required their active employment to prevent embarrassing complications, and these or other international blunderers may any day set the Canadian frontier aflame. The instant that Great Britain is involved in war a military cordon on the north will be necessary for our own neutrality. In like manner, the Cuban question may lead to an embroglio; and the Rio Grande is no barrier, and but an indifferent boundary as Mexican affairs now run. We are no alarmists, and the immediate foreign outlook is reasonably serene; but modern war is its own herald, and the reduction of our minimum army would place us among very foolish virgins who had thrown away their lamps as well as expended their oil. But the constant Indian and the possible foreign problems are not the only ones that may require martial solution. Utah has its thorn in the flesh that may demand military surgery in the future as in Sidney Johnston's day. New Mexico is virtually a foreign province, despite the sweet pipings of ambitious politicians, and fortune may tempt the alien people, who to this hour hate the Americans, to repeat and extend the revolt of Taos. The inhospitable climate of Alaska may shield its natives from fierce contact with the pioneer, but if the unregenerate squatter ever migrates there, as Mr. Seward dreamed, there will be loud and real calls for the army in force. We thus barely indicate some military possibilities, although, as becomes our Centennial year, we are now in a state of unusual repose; for the doors of Janus are never locked, and no one can foresee the disturbing jar.

The prompt reply that this representation will receive is that an army is costly, and that volunteers will appear when war comes. An army is costly, but neglect is generally extravagance. The shepherd who delays sending for dogs until wolves attack the flock, will find slaughtered mutton more expensive than dog-feed. An army on a war-footing is only for war, but the true peace establishment is one of efficient activity. One overgrown would be mischievous, but one impotent from size would be less economical; for efficient as well as merciful war is really short, sharp, and decisive. The common argument assumes that in peace the army makes no return for the money expended upon it, that to cut it down will be a positive saving, and that, in fact, volunteers will do the fighting when hostilities occur. That the army makes a positive and constant return, albeit not in the shape of visible dollars paid into the Treasury, we may point out another time; but to assume that reduction below a certain limit is economical is akin to the fallacy of undermanning a steamship. A few dollars in wages may be saved,

but the essential working expenses are not diminished, and a very serious risk of wrecking the whole establishment is incurred. Volunteers saved the nation, but they did so as determined citizens bent on upholding the Government at every sacrifice; for, with all their courage and all their patriotism, there is no more costly machinery for waging war than volunteer organizations. They are wasteful of time, of stores, of money, and, above all, of lives. Disease makes fearful havoc among such troops. Our regulars will never form the body of a mobilized army, but they should always be its soul, for a division of disciplined troops is the tempered lance-head making efficient the extemporized column that it leads. To tear to pieces a delicate machine—a machine that is vital in a double sense—with the certain knowledge that it must speedily be reconstructed, merely to save the friction of its daily use, is a blunder that no statesman will countenance and that no politician will look upon with complacence five years after he has voted for it.

That the discipline and organization of the force now in existence are what they ought to be, we by no means pretend. The army has suffered since the war from the same causes which have corrupted and are corrupting the civil service. Its tone has been lowered by leniency and favoritism in high quarters, as well as by the spirit of money-getting which has, since 1868, flowed through all branches of Government like a flood of lava. It is with the remorseless removal of whatever has interfered or is interfering with the discipline and honorable feeling of the force that the present Congress ought to occupy itself. In cutting down its numbers, we are simply diminishing the effectiveness of the only instrument of its will on which the Government can at this moment implicitly rely.

## "GOVERNOR TOM'S" PI-UTE LETTERS.

WE published last week a letter from ex-Governor Thomas C. Fletcher, of Missouri, on the subject of his "Pi-Ute" correspondence with the *Globe-Democrat*. In this he renewed his declaration that in charging him with writing certain letters "defending Delano and whitewashing the Interior Department and the Indian administration, and of generally taking the part of counsel for the defence," we foully slandered him; admitted that he did write the "Pi-Ute" letters, but denied that they were in substance an attack on Prof. Marsh, and filled with puffs of himself, and "so constructed as to have no meaning except as a defence of Delano and Smith," and demanded that we should "publish the letters fairly." We should have been delighted to do this but for the danger of establishing a precedent of a very perilous nature. To republish the "Pi-Ute" letters would require something like an entire issue of the *Nation*, and as simple justice would exact that what is done in the case of one aggrieved man should be done in every case, and almost all public men now labor from time to time under "charges" or "slanders" of some kind, we should be obliged to impose upon the readers of the *Nation* a good deal of reading which is already brought within their reach by the enterprise of the daily press. Besides this, Mr. Fletcher seems to have overlooked the fact that instead of having "no newspaper" at his command, he has three—first, the *Globe-Democrat*, in which he published his correspondence; second, the St. Louis *Republican*, in which he has begun to publish letters addressed to the *Nation;* and, third, the *Nation*. We believe we may also anticipate another opportunity for him to defend himself, namely, before an investigating committee at Washington this winter (where we, of course, cannot appear); and, besides all this, he challenges Prof. Marsh to cite him before the Faculty of Yale College—an admirable suggestion, which will without doubt be acted upon by the Professor. Nevertheless, though we cannot republish the entire correspondence, we will do what we can by extracting from it a few passages here and there to show its general drift. To appreciate them fully, we must beg the reader to bear in mind that they are written under an assumed name by the chairman of a Commission appointed to investigate charges brought against the Indian administration by Prof. Marsh, and which he laid before the President expressly on the ground that the heads of that administration—Smith and Delano—were, in his opinion, in a measure at least responsible for the frauds. The Indians therefore are the plaintiffs, and Prof. Marsh is their volunteer attorney; Smith and Delano and their subordinates are the defendants; while Governor Fletcher is chief of a board of judges appointed to try the case.

The first letter of the correspondence which we have before us is a very short one, dated at Omaha, July 26. It announces the approach of the Commissioners, says that "everybody professes" to know something about Indian contracts, and gives the following as an illustration:

"A very dignified old gentleman addressed Governor Fletcher at the tea-table to-night and said: 'I understand you are one of the Indian Commissioners,' to which Governor Tom very blandly assented. 'Well,' said the old gent, 'I know something about the way the Indians have been treated.' 'Indeed,' said Governor F., 'I will be greatly obliged to you for any information on the subject.' 'Well, sir,' said the old gent, 'I was in the Black Hawk War, and I know that the treaty we then made with the Indians was never carried out in good faith by the Government; there were some beans and other things promised the Indians which they never received.' 'Ah!' said the urbane Governor Tom, 'have you any information of a more recent date than that?' 'Oh, no,' said the old man, 'I have not known anything about the Indians since the Black Hawk War.' All that Governor Tom could say was that he feared that the matter having occurred over forty years ago, the statute of limitations would apply, but he would see about it."

Now this is pretty much all there is in the letter, and, as we are obliged to suppose that the chairman of the Commission would not have written it without some object, we take it to be the very obvious one of throwing doubt on volunteer evidence as to Indian frauds such as Prof. Marsh had been accumulating.

In his second letter (July 30), "Pi-Ute" Chief has got as far as Cheyenne, and declares that "it is hardly probable" that the Commissioners "will be able to gather much information as to any frauds upon the Indians" for the following burlesque reasons: that the contractors "elect whom they please as delegates to Congress"; that they "control not only the politics of Wyoming, but the business of every kind"; that "the beef-contractor" controls nearly all the population "outside of the towns"; while the "people of the towns" are controlled by the "contractor for transportation." In his Indian character, the chairman declares himself often "insulted" by the white men, who "ask me to work, or suggest that I had better go to work"; and adds, "Poor, ignorant white man! don't know that Indian don't work." He then makes a reference to the Red Cloud Agency, where the frauds he is commissioned to examine are alleged to be carried on, in the same burlesquing vein:

"Up in the vicinity of Red Cloud Agency there are camped from 9,000 to 12,000 red people, and they dance and run horse-races, and draw their rations from week to week during the whole year. The beef-contractor drives up great herds of beeves, the Government pays for them, and my people have sport in shooting them and eating as much of them as they desire";

while, as if to make the animus of the whole letter still plainer, he declares that he is "tired of the Indian Territory" (in which the "Indian policy" of the Government has been supposed to be most successful), because "the Cherokees and Choctaws have so far departed from all the good old Indian customs that they are now very little better than white people."

In the next letter (still dated Cheyenne, August 1), he gives some evidence as to Indian frauds at Red Cloud as follows:

"I have learned myself of great wrongs done my red brethren. The Government pays from $4 75 to $5 per 100 lbs. for flour at the Red Cloud Agency, and issues it in the original packages of 100 lbs. sacks to the Indians. Now, my people, in their glorious natural state, don't care much about flour, and they sell it to the trader for about 50 to 75 cents per 100, and when the trader has accumulated 200 or 300 sacks, he sells it again, probably to the contractor for supplying flour, and he turns it over again to the Indian agent and gets $4 75 or $5 per 100 for it again; and so it goes on, to the great injustice and exclusion of the red man from any of the heavier margins upon it."

A letter from Fort Laramie (August 5) contains two suggestions for the solution of the Indian problem—1st, that the Commissioners "invest the whole of one appropriation of $8,000,000 in whiskey, and issue it all at one time"; and, 2d, that "it would be a good and cheap thing for the white man to build a railroad to the happy hunting-grounds, and send all my people there." Arrived at Red Cloud Agency, the chairman begins work by ridiculing Red Cloud himself, one of the principal witnesses in the case, suggesting that he has "had his day" and now "rides in a wagon," and makes the following genial reference to himself and his own sagacity:

"They also have news of a fight somewhere up in the Big Horn country, in which Lone Horn, the lame chief, was killed by the Crows. Also one Minneconjon, one Uncapapa, and four Arrapahoes. I believe Commissioner Fletcher regretted that they had not attested their valor by a larger mortality list. At least he muttered something very much like it. I am afraid he does not appreciate the nobleness of my race. I don't think he properly estimates the suffering of my people. I told him how they had nearly starved last winter, and had ate their very dogs. He only remarked that the average Indian preferred dog to venison or Southdown mutton, and guessed it did not hurt him much to eat dog."

Another reference of the same sort is to be found in the same letter. An Indian party had come in, firing guns in the air and whooping, whereupon "Pi-Ute Chief" says that Mr. Fletcher observed that they were wasting their ammunition, when by "aiming lower" they might render the Government essential service; and then:

"I do greatly dislike that man. He thinks a good white man worth as much as an average Indian. He says that by the treaty the Sioux were made citizens of the United States, and so cruel is he towards my race that I believe he wants to make them wear trowsers with seats in them, and would even subject them to the degradation of making them vote at elections with white men, and then I presume he would want to put them in the penitentiary for stealing horses and cattle, and hang them for murder. The next delegation that goes to Washington to get some more horses and have a big talk, will report him to the Great Father and have his wages docked, unless he reports in favor of Mocha or Java coffee instead of Rio, and white sugar instead of brown. I believe he thinks molasses good enough for an Indian. He remarked that he thought if they ate black molasses it would probably foment (*sic*) in them this warm weather and make them lively. Think of it, O ye gods!"

It is hardly worth while after this to give any more extracts to show the "Pi-Ute's" opinion of the ex-Governor, or of "Governor Tom," as he would perhaps prefer to be referred to, or "Railroad Tom," as we believe he is called in "politics" We will merely give a few more extracts, with dates, and our own understanding of their meaning—not, be it understood, the meaning which "Tom" himself may now say he intended, but the meaning which they must have had to nine men out of ten when they were written.

In a letter dated August 6 he says: "They [the Commissioners] are discussing the Indian question generally, and while I believe they think the President's 'peace policy,' as it is termed, is the best one that could be adopted, they are discussing some changes in its details"—(Qualified whitewash). And in the same letter:

"But I was about to tell you of my suggestion for civilizing my people. It is easy and plain. Let the Government purchase us a reservation on the Connecticut River between Hartford and New Haven, and put my people upon it. If they didn't get civilization there they wouldn't get anything else unless they paid for it, and my proud nation would learn that work is not degrading, and the people whose bowels yearn towards the noble red man would have an opportunity to expend all their overflowing sympathy upon him"—(Indirect abuse of Professor Marsh and the Indians together).

Again, referring to one of the main questions in the case—the issue of rations—he says that "it is hard to tell" how the number of 13,423 at Red Cloud Agency was arrived at, because, among other reasons, they "want to overstate their numbers, so as to get more rations," and "they beat white men out of many rations in that way"—(Prejudging the case in favor of the defendants). The next letter is dated Red Cloud, and prejudges the case in the following singularly unblushing way: "The complaint that the Arrapahoes and Cheyennes had starved last winter was not sustained by anything that could be drawn from them."

In the next letter, dated Whetstone Agency, occurs this passage:

"The whole plain for ten miles from the Agency was strewn with the skeletons of the beeves issued to my people. One good Indian was gathering up beef-bones on the prairie, and when enquired of as to what he would do with them, said he was going to ship them to Professor Marsh, at Yale College. We did not get a clear understanding of his object. He knew Marsh was in want of bones, and perhaps it did not occur to him that there was much difference between beef-bones and the bones of the mastodon. Perhaps he thought Marsh could tell from the bones what kind of beef he had been getting for his wakapomanie, or grub"—(Ridicule of Marsh and of the Indians together).

And this:

"The investigations of the Commissioners are being made with great care, and will be thorough in every particular. They have examined about seventy-five witnesses, and have a great mass of testimony and documentary evidence"—(Puff of the Court, including, of course, the presiding judge).

And this:

"Then there is another peculiarity of the whites. If one of them does not understand what another is doing, he at once accuses him of rascality. The great defect in the white man's law is that there is no provision made for requiring every one to mind his own business"—(Slur at the whole investigation and the motives of its promoter, Professor Marsh).

The next letter, dated "Camp on Chardron," purports to give an account of a "talk," or, in other words, of some of the evidence taken. Of the witnesses, the evidence of one is given in a broad vein of "Pi-Ute" burlesque; another is spoken of as endowed with a vast amount of "rascality"; while a third is described as a "dead beat." Spotted Tail, however, is spoken highly of:

"He showed a perfect knowledge of the whole subject, and the clear, concise, and forcible manner in which he stated the case could not be excelled. He showed that the *appropriation was not sufficient, and that covered the whole case*"—(Another unblushing prejudgment of this part of the case in favor of the Government, Delano, and Smith, at the expense of Congress).

The next letter, dated "Camp on White River," gives an account of the attempt of the Red Cloud agent (under investigation) to put up a flag on the Agency as a signal for the benefit of the Indians, declares that the Indians "rallied" and "cut up the pole" and "threatened to burn the Agency," and adds:

"Oh, how lamentable is the folly of most white men. Professor Marsh fortunately had the wisdom to comprehend the matter and the bravery to bring the agent up for an investigation. My people are always delighted to find a white man of sense and practical knowledge of business and things of the world, and free from prejudice—a man hunting bones, or something of the kind, who will believe what the noble red man, with one lounge [*sic*] and good heart, will say on the question of grub, or what a squaw-man or half-breed who don't like an agent will say about him."

As to the chairman, this letter announces the fact that he "pushes everything day and night," breaks camp "usually before sunrise," and often examines witnesses "till midnight"; and as to the witnesses generally, "the difficulty is that the Indian and squaw-man and half-breed has so much upon his mind that he cannot recollect till to-morrow what he says to-day"—(Puff of the chairman and burlesque of the whole investigation).

From these extracts any one can judge for himself of the character of the letters. We are quite ready to admit that if we had examined the letters at first in this minute way, we should not have characterized them as whitewashing Delano and Smith and the Indian administration directly, but rather as consisting of burlesque of the evidence, impeachment of many of the principal witnesses for the plaintiffs, slurs on the motives and intelligence of the prosecution—all indirectly tending to produce an impression that the whole prosecution was a mistake, and that the general management of the Indians was in good hands. Every one knows the old story of the advice given to the lawyer who has no case—to "abuse the plaintiff." If we can go so far as to imagine the story told of a judge on the bench appointed by the defence to try the case, we should have an exact parallel in "Governor Tom's" case.

But we imagine that we have taken up enough time in discussing the defences put forward by Mr. Fletcher for his conduct. The offence of which he has been guilty lies not in the particular turn which he gave to the "Pi-Ute" letters, but in the fact that they were written at all. Mr. Fletcher was a judge appointed by the Government in an important case in which its good name and honor were involved. He occupied an office which, though of limited duration, was just as judicial in character as that of any judge who tries the disputes of individuals in a court of law. It was an office, too, needing peculiar delicacy and reserve as well as fairness, inasmuch as the judges derived their appointment from the defendants who were under investigation, while the plaintiffs were ignorant, helpless savages, dependent on the defendants for the common necessaries of life, and believed to have been defrauded of their food and clothing through the connivance or negligence of the defendants themselves. For the presiding judge of a court like this to open immediately a burlesque correspondence with a newspaper under an assumed name on the subject of the investigation, the witnesses, the evidence, and the general character of the defence and the other side, is an outrage of decency so gross that we believe no instance of its having been committed in this country before can be produced—not even in this city, nor in the worst days of Barnard, Cardozo, Fisk, and Tweed. When we add to this the fact that Mr. Fletcher, being discovered in the act, instead of maintaining, as a man at all restrained by public opinion would have done, a most careful silence, rushes forward with the air of an injured man and proclaims that he wrote the letters, and that it was a proper thing to do, we may see in him a new and extraordinary instance of the lowness of the prevailing tone in politics, and the confusion as to the commonest rules of right and wrong on which our white "Pi-Utes" ply their trade.

## ENGLISH OPINION ON THE SUEZ CANAL PURCHASE.

LONDON, December 6, 1875.

IN my last letter I stated that public opinion in this country was fixed (so far as public opinion can ever be fixed) on the Eastern question; that we were making up our minds to change our traditional policy of upholding the *status quo* of the Turkish Empire; that we were concentrating our attention upon holding in our own hands the communication between the Mediterranean and India; and that we were prepared to fight, if unhappily

we should be driven to do so, in defence of our new position. In making these statements, I disclaimed any official knowledge of what was going on, and I am not ashamed to admit that I was profoundly ignorant of the negotiations for the purchase of the Suez Canal shares from the Khedive; but as that ignorance was shared by my neighbors—that is, by the entire population of these islands except the Cabinet and, I suppose, Baron Rothschild and a Foreign-Office clerk or two—there is not much to be ashamed of. The secret was well kept; for an English diplomatic secret, unprecedentedly well kept. Negotiations must have been in train for several days, and besides the Foreign-Office clerks, the Telegraph officials must have known that something was going on. But the enterprise of the daily newspapers and the ingenuity of the Stock Exchange were equally at fault, and, until the official announcement appeared in the *Times* of last Thursday week, I do not believe that a score of men in London knew anything about the matter. There are many stories going about the clubs and such places of male resort as to the private history of the transaction. One of these (for which a most respectable Conservative print is responsible) is that it was all settled quietly by Mr. Disraeli and Baron Rothschild over the Baron's walnuts and wine on the twenty-fourth Sunday after Trinity. The great Prime Minister, so the story goes, celebrates the Christian Sabbath in the society of the great financier—in other words, Coningsby and Sidonia dine together every Sunday. On the particular Sunday alluded to—in Mr. Disraeli's "Maundy-Thursday" style—a telegram was brought to the Baron on a golden salver announcing that the Khedive's shares were offered for sale to the French Government and that the parties were haggling about the price. "Mr. Disraeli"—I must here quote the words of the organ in question—"Mr. Disraeli suddenly raised his head and said, 'What is the price'? The Baron immediately telegraphed for the desired information to Paris, and the answer came back in a few minutes—'four millions sterling.' 'We will take them,' said Mr. Disraeli without a moment's hesitation, and from thence the matter became one merely of detail." The scene is so graphic and characteristic that, were it not that the newspaper which gives it currency is above the suspicion of a joke, I should have thought it had perpetrated a parody on the Premier's best paragraphs. It is more probable that some ingenious correspondent has played an unkind joke upon the newspaper. Another account, equally authentic, states that the Cabinet were terror-stricken by the proposal when it came before them; that Mr. Disraeli and Lord Derby were more alarmed than any of their colleagues; and that it was only by the persistent pressure of a benevolent Lady Macbeth, connected matrimonially with a leading member of the Cabinet, that the deed was done. The late Empress of the French undoubtedly precipitated the Franco-Prussian war against the wiser counsels of her Cabinet; and it may be that the consultations of our Ministers are directed and prospered by a special providence who is not responsible to Parliament. If so, let us trust that all things may be ordered and settled by her endeavors upon a better and surer foundation than they were by the special providence that presided over the destinies of France. I attach but little importance to these canards, nor do I believe that the influence of the Duke of Sutherland and the Prince of Wales was exerted, on their way through Egypt, to bring about this end. Whoever is really responsible, the Government must defend their action when Parliament meets, and to them must attach the credit or discredit arising out of it.

Up to the present time, both foreign and domestic critics have approved it. The *Times* set the example in this country, and the smaller papers generally follow the lead of the leviathan of the press upon any grave subject of foreign policy. Excellent and independent as these papers are in their criticism of domestic affairs, they are hesitating and uncertain when they come to handle foreign affairs. They have no knowledge, and they grope about in the dark. With the exception of the *Economist*, which is well informed and judicially-minded, the whole London press has simply rung the changes on the articles in the *Times*. Too much importance, therefore, must not be given to the fact that the London press has approved the purchase of the shares. The fact that the foreign press, with the exception of the Bonapartist prints in France and those which are hostile to the Duc Decazes, have also spoken favorably of the negotiation, does not prove much, except that abroad it is regarded as of less importance than it is at home. Outside the official and the press circles I hear grave doubts are expressed as to the wisdom of this stroke of policy. Men are saying, "We should like to know what Gladstone thinks of this," and "What are Lowe's views upon it?" But neither of these Pythias of finance has spoken, though probably both of them will do so when the question comes before Parliament. The only prominent member of the Opposition in the House of Commons who has discussed the subject is Mr. Fawcett, and he has thrown out some serious suggestions by no means favorable to the purchase. Lord Sandhurst, better known as Sir William Mansfield, has published a letter in the *Times* which shows that men of his way of thinking are shaking their heads a good deal over the business. He represents the better-educated military circles of English society. The old aristocratic Whigs, and the Tory gentlemen of the pre-Disraelite epoch in the history of the Tory party, do not like the sort of thing at all. The British Government, they say, never dealt in stock-jobbing transactions before this unfortunate business. We did not mind being twitted by foreign cavillers for being "a nation of shopkeepers" so long as we were under Liberal domination; but now, with a Tory Government in office and a Tory majority in the House of Commons, we did not think that we should see our Administration huckstering in shares like a parcel of Jew bill-brokers. "Non componantes bellum sed belligerentes" was the proud old Roman boast, and that should have been the boast of our new Tory Government. There is a good deal of nonsense of this sort being talked just now in the selecter social circles which is not without a certain weight.

Another class of outside critics complain that by our anxiety to get these shares we have shown our hand too soon, and thereby encouraged Russian or Austrian aggression and precipitated the dismemberment of the Turkish Empire. We have, they say, by this official act practically abandoned Turkey and opened the door for Russian ascendancy in Constantinople. We have advertised to the world that we have changed our traditional policy and thrown the Sultan over. And this has been done by a Tory Government. It is no secret that the purchase of these shares at almost a nominal sum was offered to Mr. Gladstone's Government, and pressed upon them by some not uninfluential personages in the City and at the West-end, and they would have nothing to say to it. They were not prepared to change our Eastern policy at a moment's notice, and yet they might have done it much more quietly, and with more dignity, than the present Government has done it under cover of the Turkish repudiation. Depend upon it, the Gladstone Government had good reasons for their abstinence. It may be that circumstances have changed since then, and it was right that we should show our hand, and show it by some open and decided act. On this point we would reserve our judgment until the whole proceedings and correspondence are laid before Parliament. Another body of objectors ask the question, How is our position in the East improved by the purchase of these shares? We are four millions out of pocket, and, though the Khedive promises to give us interest upon this sum for a period of nineteen years, it is very doubtful if we shall ever see a penny of it. We have secured a certain number of votes—some say ten, others say more, and a well-informed correspondent of a leading weekly paper says that deferred shares like ours have no votes at all—in the management of the concern, and much good they will do us. If serious complications were to arise, our ten votes, if we have them, would not be worth the trouble of giving them. We should have to show something much more formidable than voting power, and that we should have to do whether we had the shares or not. Still another criticism is passed upon the action of the Cabinet—it is without precedent and unconstitutional. The executive is not entitled to spend one penny that has not been voted by Parliament, and, though an unconstitutional act of this kind may be approved of in a great emergency, and got over by the device of an act of indemnity, the country looks with jealousy upon any such transaction, and desires to get the judgment of Parliament upon it at the earliest opportunity. Parliament ought to have been summoned together for a short session as soon as the decision to enter on the transaction had been taken. Many weeks must elapse before the regular meeting in February takes place, and every sort of wild scheme will be proposed and discussed before then. We may find ourselves embarked upon a project for buying up all the other shares at an additional outlay of twenty million sterling, or for widening or deepening the Canal, or for lowering the tariff, or what not, before the initial proceeding has been approved.

The *Economist* of this week goes very near proving, though on what it admits to be imperfect knowledge, that financially, commercially, and politically the purchase is a failure. It leaves an impression on the mind that we have been "jockeyed" (if I may use the expression) by the Khedive, and have really got next to nothing for our four millions, or I may say our eight millions, assuming that we shall get no interest and no return for nineteen years, and that is an unpleasant impression to be allowed to float about, though it satisfactorily explains the approving attitude of our foreign critics. I suspend my judgment upon the whole transaction until I see the correspondence, and read the papers, and hear the explanations of the Government. But no one can doubt that Mr. Disraeli has been ill-advised to postpone the meeting of Parliament to the usual time. In his own interest he ought to have summoned it to meet at once. In the present state of public

opinion he would have got his act of indemnity with little trouble. He may get it in the actual course of events, and in that case success will justify the delay. But, on the other hand, he may, and probably will, have to face a strong reaction of public opinion, and indications of reaction are manifesting themselves daily. He certainly will have to face a good deal of hostile criticism which will have time to crystallize, and before the 4th of February people may have convinced themselves that of all the mistakes which this Government has committed, the purchase of these unprofitable shares is the gravest and the least defensible.

# Correspondence.

## IS BUSINESS IMPROVING?

To the Editor of The Nation:

Sir: At short intervals during the several past months the *Nation* has informed its readers that a general revival in business was taking place, and that the trade of the country was improving in a marked degree. As you still persist in this view of affairs, will you permit me to give you a few reasons why I think you are mistaken, and then be kind enough to publish your grounds for believing that the past few months have shown any material increase of business prosperity?

The mere fact of a certain activity existing in the merchandise which composes the bare necessaries of life is no sign of business well-doing, especially when, as is now the case, most of these commodities are sold at an absolute loss on their first cost of production. The iron business is one of the greatest industries of the country, and I very much doubt if any one engaged in it would say the past year has afforded him any profits, or that the outlook for the coming one is any more promising. A great many large furnaces and foundries are closed, and many of those now running are only doing so because they can't stop. With lumber it is the same or even worse. Up to the close of navigation, prices have steadily declined both in the Eastern and Western markets, and it is safe to assert that all of the business in this staple in 1875 has been done at a loss to the manufacturer, not only on the legitimate profit he should realize, but on his absolute expenditure of money in producing his stock. The same is true even in a greater degree of our dry-goods staples. A great many woollen mills are closed up, and on several large lines of woollen goods there has been a decline in price lately from the previous low rates. In the various manufactures of cotton there has been this year, and most of it recently, a reduction in price ranging from 10 to 20 per cent., and in some instances much greater. The recent circulars issued by the agents of the large dry-goods manufacturers in New York show that *now* very nearly all of their stock is for sale at lower prices than a year ago. The foreign trade we are now having in cotton fabrics to new points of demand, it is safe to say, is all done at a large loss to our manufacturers, and simply to unload the goods which have accumulated on their hands. Owners of large factories can better afford to do one or two years' business at a loss than to stop their works and disperse their workmen; and it is the general history of such establishments that they keep on through hard years working at a loss until the weak ones fail, and then, after compromising, start again, or sell out to some one who repeats the performance.

A late statistical circular of Dun, Barlow & Co. gives the number of failures which have occurred during the first nine months of the year in the United States, with the amount of liabilities. The total number is 5,334, with liabilities of $131,172,503. Of these, 1,771 failures, with $54,328,227 of liabilities, occurred in the third three months of the year—an excess of about 200 failures and $20,000,000 of liabilities over the second three months. The failures and liabilities for the first nine months of 1875 are also greater than the average of failures and liabilities for nine months of any of the four preceding years by 1,174 failures and $3,730,000 of liabilities. Now, the increase in the number of failures, still more than in the amount, is an unfavorable symptom of the business condition of the country, there having been 3,050 in 1872, 3,887 in 1873, 4,371 in 1,874, and 5,334 in 1875, taking nine months of each year.

It is fair to say, however, that the circular from which I quote states that "in anticipation of the movements in crops and currency a fair trade has been done at almost all jobbing centres," and "that as compared with the condition of things at this date last year there is certainly an improved prospect." It is now nearly two months since the above was written, and I am credibly informed that since then the previous rate of failures has been fully kept up, both in numbers and amounts of liabilities. Any change in the price of staple articles of manufacture has been for the worse, and the feeling among business men is one of hopelessness for the future, rather than satisfaction with the present.

Yours truly,

Brooklyn, Dec. 15, 1875. D. S.

[In noting, from time to time, such improvements in the aspects of business as have appeared on the surface, we were always to be understood as comparing the actual condition of things either with the depressed condition of business which prevailed during the first year following the panic or with the unsound condition existing previous to the panic. It would be strange indeed if, after such a severe remedial process as set in with the events of September, 1873, there should have been no signs of returning health in 1875; and it would perhaps be equally strange, considering how thorough and universal was the derangement of business when the panic occurred, if there should not still remain much that is unsatisfactory in the state of industry and trade. "D. S." has taken much pains to expose the still diseased spots in our industrial system, and we do not say that he has entirely overdrawn his picture. But what of his facts? They show that the process of recovery from the effects of the panic—or, more properly, from the derangement that caused the panic—has not yet run its complete course in *all* branches of business. Some interests are naturally reached by it later than others, and some, being affected by a greater complexity of influences, yield more slowly to the remedy than do the remainder. But are we to conclude, because the recovery is not complete and universal, that therefore there has been no improvement? Besides, some discrimination should be made as to what constitutes an improvement or recovery in the condition of business. There may be a great deal of recovery that is not indicated on the merchant's ledger. If, for instance, a manufacturer who has been making goods at a continual loss effects such a reduction in the wages of his employés and in the cost of his raw material as enables him to produce goods proportioned to the purchasing ability of consumers, there is a fundamental improvement in the condition of his business, and, to say the least, he stands on the threshold of prosperity, though at the moment there may be little demand for his goods. Within the past year there has been a large amount of improvement of this kind in every branch of manufacturing industry, and even among those which "D. S." instances as specially depressed. Where such a change has occurred there is a basis for confidence and for ultimate activity which did not exist before; and in all interests thus affected there is now a much more hopeful feeling than there was a year ago. This we deem improvement. So, also, we reckon it as of some account that the crops of the West and the South are likely to yield an exportable surplus that will bring a good deal more than the ordinary money value. The cotton crop, for instance, promises to be the second largest in our history. These are facts which in both these sections – and five-eighths, if not three-fourths, of our trade is with them—have brought about a state of business which is certainly an improvement on that existing in 1874.

We do not entirely agree with "D. S." in regarding the number of failures as a measure of the current depression of business. They are rather an indication of the extent of the insolvency which past evils and the decline in prices have produced. Suspensions are an inevitable consequence of a reactionary crisis, and they may, and usually do, coexist with a genuine improvement in the conditions of business. Indeed, they seem to be essential to a thorough cure of commercial disease, and any reaction is to be distrusted, as having only half effected its work, if it is not attended with a good crop of failures. The past year has done much more than was accomplished in 1874 towards removing the complex derangements by which all values and wages have been inflated and the whole industrial, commercial, financial, and social life of the country vitiated; and although many have apparently been hurt by this process, yet all classes and interests have been brought nearer to their normal condition. Assurance that this reconstruction has worked out its full results is, of course, needful for the full restoration of activity

in all departments of trade and industry. That we may have to wait longer for it is perhaps true, but that we have made rapid and great advances towards it in the past year—particularly the last half of it—there is no room for doubt. Nor are there wanting signs that we are closely verging on a period when confidence in the future, and impatience over the past, will unite capital and labor in prosperous activity. The new era, however, must not be judged by the false standards so mistakenly accepted during the time of spurious prosperity, from 1861 to 1873. Our future progress must be measured by the old landmarks. If "D. S." could be persuaded to estimate the present state of affairs by comparing it less with the ante-panic standard, and more with the fundamental conditions of true prosperity, he might discover some ground for our occasional hopeful utterances, and would, perhaps, feel at liberty to modify somewhat his present lugubrious views of the situation.—ED. NATION.]

## Notes.

IT is proposed by the Harvard Art Club to raise a fund with which to found a travelling scholarship, the holder of it "to visit a place or places, determined by the Club, within the regions of ancient culture, to undertake such investigation or exploration as may be practicable," and to keep a journal, which may be published at the discretion of the Club. Works of art procured by this means are to be placed on deposit with the University for suitable exhibition. The holder of the scholarship is to be chosen by the Club (subject to the approval of the President of the University and of the Professor of the History of the Fine Arts) from among Harvard graduates of recent standing. Subscribers of one hundred dollars or more will become honorary members of the Club; those of fifty dollars, associate members. The annual subscription to the fund will be ten dollars, payable Oct. 1 in each year. The treasurer of the Club is Mr. A. C. Gurnee, Cambridge.——The editors of the *Harvard Advocate* intend publishing next month a volume of poetry culled from former issues of their lively sheet. They certainly do not exaggerate the superiority of the average versifying in the *Advocate* over that of any other college periodical with which we are acquainted.——F. B. Patterson announces 'The Amenities of Verbal Criticism,' an impartial showing, by appropriate extracts, of the dreadful consequences of debate induced by *odium philologicum*. Mr. Chas. F. Cox is the author.——By a rare chance, the citizens of Westerly, R. I., were recently fortunate enough to secure the services of M. Hammerel, leader of the chorus at the Opéra Comique, Paris, as director of a Choral Harmonic Society, organized for the practice of secular and religious choral music. We were about to congratulate them on the part this society was likely to play in any Centennial combination, when we learned that their meagre attendance at rehearsal on the 6th instant was regarded by M. Hammerel both as a sign of their indifference to their opportunity and as a mark of disrespect to himself, and that he incontinently withdrew from all connection with the enterprise. Perhaps Providence, where M. Hammerel is or has been staying with a former pupil of his, might profit by Westerly's mistake.——We are often asked to recommend some foreign periodical to a student of the language in which it is published. Hitherto, we believe, there has not been any single catalogue embracing all important foreign periodicals classified and described sufficiently for intelligent selection. This has now been done to a very full extent by Mr. L. W. Schmidt, 24 Barclay Street. His Catalogue of American Periodicals, similarly arranged, will also prove useful to those who consult it.——J. R. Osgood & Co. will publish, in uniform style with their new edition of Hawthorne's works, a biographical sketch of the novelist by his son-in-law, Mr. G. P. Lathrop. It will contain many unpublished details, especially concerning his youth. ——George Eliot's 'Daniel Deronda' will be published by Harper & Bros., and Thomas Hardy's 'Hand of Ethelberta' by Henry Holt & Co.

—The *Evening Post* has been "journalizing" again. On the last occasion (June 11, 1874), it said the *Nation* had given it "a benevolent reprimand for making any mention whatever of M. Rochefort's letter in the *Herald*" This imposed on us the painful duty of calling attention to the fact that what the *Nation* said was that "it was surprised to see a paper of the *Post's* standing treating his (Rochefort's) history of the Commune as worthy of credit." The *Post* does not "journalize" so often as the *Times*, which is peculiarly reckless in this field, but then the *Times* never ventures on pure invention or complete falsification. You can usually discover the passage it has distorted. The *Post*, on the other hand, now and then invents boldly—so boldly that there is absolutely no basis for its "journalism." On Friday evening it said that "the *Nation* had for years been making merry at the expense of persons who believe that honesty in politics as in everything else can only be secured through the instrumentality of honest men." This is pure invention. Also that the *Nation* "has for several months been busy insisting that *all* the citizens of New York who voted against the Kelly candidates in November, and who now desire the overthrow of Tammany Hall as a political power, *were and are actuated simply and solely* by the demagogic purpose of paying the public laborer two dollars for work which the private laborer does for a dollar and a half." (The italics are ours.) This is also pure invention, so pure that no phrase or passage can be discovered in the *Nation* giving any foundation for it. We remember no worse case of "journalism," and it is so flagrant, especially when followed by the amusing statement that "these persistent assertions had impaired the *Nation's* reputation for fairness," that we feel compelled to call the attention of the editor, as a man of honor, to the dangers both to faith and morals of this sort of controversy. He is now placed in the peculiarly embarrassing position of having either to produce the basis of these remarks on the *Nation*, or to admit himself guilty of "journalism" in its most soul-destroying form.

—A new loop-hole for the escape of defendants in libel suits is foreshadowed in the quiet sarcasm of a recent victim of the ready reviewer. The Report on the Yellow-Fever Epidemic of 1873, by Dr. Frank W. Reilly, briefly noted in these columns (No. 536), having been made the subject of a review in which, as he alleges, the quotations were invented and views and opinions of the most heterodox character gratuitously furnished by the reviewer, he suggests the preservation of the article as "an illustration of the curious vagaries of *amnesic aphasia*"—a peculiar affection of the brain which manifests itself, among other symptoms, by a perverse dislocation of ideas and things from their vocal representatives. This seems to be a decided improvement on the Pickwickian mode of explaining away offensive or libellous utterances, and the hint is commended to the sharp practitioner, as likely to be of at least equal value with the plea of "emotional insanity" in another and analogous group of defenceless cases.

—Mr. H. H. Bancroft, in his third volume on the 'Native Races of the Pacific States'—which is noticed on another page—uses a singular philological term which he seems to have coined himself, and the invention of which shows a true Western enterprise and boldness. This new term is "sound-shunting." He says, on pp. 553, 559: "Among these same northern nations of which I am speaking is found that certain system of *Lautverschiebung*, or sound-shunting, originally discovered by Grimm in the Indo-Germanic family, and by Professor Max Müller called Grimm's law." And on p. 670: "I allude to Mr. Grimm's discovery of what has been termed *Lautverschiebung* or *Lautveränderung*—Anglicé, sound-shunting." And he adds: "This phenomenon consists of the changing or shunting of certain vowels or consonants in the words of one language into certain other vowels and consonants in the same words of another language," etc. The law here referred to does not call for remark in these columns; but the word "shunting," by which Mr. Bancroft attempts to define it, while perfectly familiar to some, will be new to many of his readers, not only in this figurative sense but in the literal. In its literal sense, however, it belongs to the literature of the day; for Mr. C. F. Adams, jr., uses it repeatedly in his article on "Railroad Accidents" in the December *Atlantic*. It is strictly a railroad word, and as such is fully defined in the dictionaries. According to Webster, a shunt is "a turn off to a side or short rail that the principal rail may be left free," and the verb is supposed to be contracted from "shun it," or derived from the Dutch *schuinen*, to slope, *schuinte*, a declivity. In the rural districts of England it is used with the meaning "to shun, to move from, to give a sudden start to, to shove." In railroad phraseology, "shunting" is equivalent to "switching off," and the word, therefore, may be taken as representing well the noticeable difference between the railroad dialect of England and that of America. In England, they say "railway" for "railroad," "carriage" for "car," "luggage-van" for "baggage-car," "wagon" for "freight-car," "goods-train" for "freight-train," "shackle" for "couple," and so on. These several pairs of words are exact synonyms, and yet there is scarcely any intermingling of the two on the two sides of the ocean. On the Erie road, which is largely under English control, the word "railway" has been adopted instead of "railroad," and the sleeping-cars are called "coaches"; but taking the country through, these dialectic differences are rigidly marked and perhaps permanently established. In view of the recent origin of the railroad system, the constant intercourse between the two countries, and the large amount of correspondence on railroad matters

which must be constantly going on, these variations are a phenomenon worthy of study.

—M. Charles de Mazade, one of the most active contributors to the *Revue des Deux Mondes*, has lately published in that periodical an article entitled "La Littérature et nos Désastres," in which he discusses an interesting topic, though he perhaps throws no very intense light upon it. The gist of his article is the question, "What did the Empire do for French literature?" His conclusion appears to be that it did little—a conclusion in which many persons will agree with him. It behooves such persons to remember, however, that it is hard at all times to measure what, for good or for ill, the political administration of a country does for its literary tone. If the government is corrupt, it is very likely that the books of the day will be poor; but this is rather because the people who put up with a corrupt government are the sort of people to write poor books than because the political régime exerts any very direct pressure upon literature. M. de Mazade reminds us of the brilliant beginnings of contemporary French literature during the period from 1830 to 1848, and then asks what it has come to in the hands of such writers as MM. Feydeau and Zola. It is very true that the "generation of 1830" offered an extraordinary reunion of genius and enthusiasm, and that it produced a series of masterpieces; but the generation of 1830 had been preceded by the despotic First Empire and the narrow régime of the Restoration, and although the reign of Louis Philippe was comparatively, for Frenchmen, a very comfortable one, its tone was certainly not particularly inspiring or nourishing. However that may be, it is incontestable that as the powerful talents who had passed their maturity dropped away, their places, under the Empire, were never filled. We can think of but two eminent writers who rose to conspicuity after the *coup d'état* of whom it may be said that their talent is of an elevated order: we allude to MM. Renan and Taine. A great many clever writers sprang into activity, but their cleverness had always a vicious strain in it. The "moral" writers under the Empire were extremely feeble and unreadable. The Empire had decidedly a taste of its own, and that taste was a very bad one. The books of the day have its stamp, but it is very possible that they gave as much as they took. The Empire had indeed a literary style which was as bad as possible—the pretentious, hollow, insincere style of Napoleon III. in his speeches and addresses, the "official" French of the *Moniteur*. In so far as this insufferable phraseology rubbed off on other productions it was of course most baleful. French talents and cleverness were, we believe, as great as ever under the Empire; it was what underlies talent—thought, feeling, conviction, substance—that was wanting. Everything ran to form, and the successful books were apt to resemble little vases, skilfully moulded and chiselled, into which unclean things have been dropped. It was not always, indeed, that the successful books had form to recommend them; M. de Mazade accuses the "sovereigns" of reading 'Rocambole' at their villas. Apart from the other many excellent reasons for hoping for the continuance of the Republic in France we have this additional ground for deprecating the resurrection of the Empire—the permanence of the Republic will help, namely, to solve a curious intellectual problem: how far can a government really "encourage or discourage good literature." If under the Republic the chiselled and gilded empty shell of French literary form really finds a living soul again, we shall almost begin to believe in the old traditions about the "protection" of literature.

—We encountered in some journal several weeks ago the rather surprising statement that "M. Ernest Renan was at Ischia writing a novel." It appears that at the time it was published the first half of this statement was true; M. Renan had indeed the felicity of being at Ischia. Whether he was writing a novel or not, we are unable to say; but he was writing something very nearly as entertaining. He has just published in the *Revue des Deux Mondes*, in the form of a letter from Ischia, a singularly interesting account of some of the doings of the late learned Congress of Palermo. It is written in the exquisite style usual with M. Renan, and it will well repay reading. At the close of the Congress, Signor Bonghi, the Italian Minister of Public Instruction, organized a ten days' excursion to the various ruins and historical sites of Sicily. Every one present seems to have had very little time to spare, and the party travelled at high pressure beneath a Sicilian September sun. M. Renan says that he did not sleep during the whole ten days, and that at last fatigue overwhelmed him; but he saw everything, and, thanks to his large erudition, understood everything. As an honored guest, he takes a rather rose-colored view of Sicily; we hear not a word about brigands; it is all a population of "braves gens." Here is an interesting passage:

"A surprising ease, occasionally a little presumption, are the fruit of the high sense of his nobleness of origin which is the characteristic of the Sicilian. The idea that he is inferior to any one in the world never occurs to him. The petty tricks that we call reserve and discretion are in us the relic of a long social inequality. The Greek is equally unacquainted with these timidities. At first I was surprised at the innumerable letters, at the cosmogonies and treatises on the universe and the nature of things, at the projects of universal reform, that I received every day. It is not often that with us a stranger comes to you and says, 'Your philosophy is mine,' or, 'You are one of the small number of persons who have arrived at the just conception of the created.' Then you remember that you are in Greece, that things took place in this way in the time of Empedocles, and that it is owing to this awakening that humanity began to institute a search for causes. Sicily is perhaps the country where a taste for speculation is most natural. If anything can still give us the idea of a country in which, as in Greece, the taste for beautiful things was the care of a whole people, and in which the difference of culture between the inferior classes and the upper ones existed only in degree, we must look for it in Sicily. What seems to us *naïf* is simply antique. The joyous greeting given in the country districts to the Congress was a spectacle that no other country in Europe could have offered."

It is agreeable to hear all this about regions from which the principal news lately has been the doings of the *mafia* and the impossibility of getting juries to convict murderers. Upon the great ruins—Syracuse, Agrigentum, and Taormina—M. Renan is of course very eloquent and interesting.

—A correspondent writes us as follows: "I send you a parody of Baudelaire's style which appeared in a French newspaper soon after the publication of the 'Fleurs du Mal.' It is not much of an exaggeration, as any one can see who will look at the quotations from 'Delphine' and 'Le Voyage,' given by Saintsbury in his *Fortnightly* article last October. And it may be of use in settling the mind of your correspondent, 'W. J.' (*vide Nation*, December 2), who 'penned a short notice' of Baudelaire at second-hand from Saintsbury's paper for a 'Manual of the Literature of the XIXth Century,' and was afterwards bewildered by Edmond Scherer's very different view of the author in question":

TO MR. KRIGGER, TAILOR, WHO HAD THE BAD TASTE TO BRING ME HIS BILL WHILE I WAS AT BREAKFAST.

"On craint la Mort; mais moi, j'aime cette Carogne.
Vieille Camarde! quand voudras tu de mes os?
Je me sens fatigué de ma triste besogne
Ainsi qu'un vidangeur accablé de travaux.

"Un autre en rougirait, je le dis sans vergogne:
Ne pouvant pas avoir de splendides tombeaux,
Je veux qu'un noir fumier reçoive ma charogne;
Je veux être mangé par d'immondes corbeaux.

"Oui! lorsqu'un tas de vers, aimant la pourriture,
Viendront me dévorer la poitrine et les bras,
Et quand mon estomac sera rempli de rats,
Je rirai tout mon saoul, tailleur! car ta facture,
Mané Tekel, Pharès de mon maigre repas!
Etant mort, o tailleur! je ne la paierai pas."

—Few men have made as many books as Le Bibliophile Jacob, and it were well if all bookmakers were as industrious and as conscientious as the librarian of the Arsénal. His 'Mystifications et Mystifiés: Histoires Comiques' (Paris: Dentu; New York: F. W. Christern; 8vo, pp. iii.–311; 1875) seems to be a mere reprint of newspaper articles. The first chapter gives an historical sketch of hoaxing in France; each of the three other chapters is devoted to describing a series of practical jokes. Perhaps the most amusing is the colossal correspondence carried on in 1785 by the Comte de Fortia de Piles under the *nom de plume* of Caillot-Duval. The Count was a cavalry officer stationed at Nantes, who, to relieve the tedium of garrison life, wrote letters to fifty different people, of all sorts, flattering and bepraising and asking for advice and assistance. In 1795, he published at Nancy the complete correspondence, giving in full all the letters he had written and received. M. Lacroix confines himself to France, and makes no mention of the hoaxes of Hook and Mathews in England, or of Franklin's scalp story, or of the Cardiff Giant in this country. At the end of the volume announcement is made of a uniform reissue of the author's works of fiction, and the titles are given of twenty-eight books in sixty-one volumes. Upon the cover three books are advertised as just out and four more as in active preparation. It is to be hoped that M. Lacroix will some day draw up a bibliography of his own works. It would be especially interesting if it gave particulars of the anonymous assistance M. Lacroix rendered to the elder Dumas.

—Professor Schmoller, of Strassburg, one of the leaders of the "Kathedersocialisten," whose 'Grundfragen des Rechts und der Volkswirthschaft'—a controversial treatise in reply to Treitschke's "Socialismus und seine Gönner"—we have recently noticed, has just published two addresses of peculiar importance and interest not only in themselves, but as illustrating the aims and methods of the "Historical School." The first, 'Strassburgs Blüte und die volkswirthschaftliche Revolution im XIIIten Jahrhundert," was delivered upon his assuming the rectorate of the university, October 31,

1874; the other, in continuation of it, 'Strassburg zur Zeit der Zunftkämpfe und die Reform seiner Verfassung und Verwaltung in XVten Jahrhundert,' was delivered May 1 of the present year, on the occasion of the anniversary of the foundation of the university. We have never chanced to meet with anything which gave so clear and compendious a view of the municipal history of the Middle Ages as these two thin pamphlets. The first treats mainly of the origin of municipal government, essentially from Nitzsch's point of view, although in some points agreeing with Heusler. Of course this difficult subject cannot be treated without leaving some gaps and obscurities; and the second address is at once more complete and of more general interest. After treating of the origin of the guilds (Zünfte) and the revolution which placed them in power in the XIVth century, he goes on to describe the mischiefs and misgovernment of the thoroughly democratic régime thus introduced, and the methods by which these were remedied in the fifteenth century. This is perhaps the most striking portion of the whole. The mischiefs to be remedied were precisely those under which we are suffering in our democratic republic; and that they were successfully and thoroughly remedied is a significant and instructive fact. The method, too, is remarkable. It consisted in making no essential change in the forms already in existence, but in adding new features which served to control the bad tendencies. The council (Rath) and the magistrates continued with powers somewhat limited, but not materially altered, only above the council were established three new boards—the XIII, the XV, and the XXI (called the *Geheime Stuben* or *das beständige Regiment*), the peculiarity of which was that they were composed of men of administrative experience who served for life and without pay—composed in due proportion of members of the patriciate and members of the guilds. The Board of XIII was of gradual formation, and at last assumed the chief administrative authority in the state; it appears to have encroached upon the functions of the magistrates much as the Spartan Ephors upon those of the kings. The XV were the most remarkable institution, and remind one of the Athenian *Nomophylakes*. It was their business to watch over the execution of the laws as well as alterations in the laws themselves, which were submitted to them, and which could not be made against their unanimous opposition. The Board of XXI (so called, for its numbers varied) was in the main composed of the other two; it formed a sort of supplementary council which must be called to sit with the old council in certain specified cases. These constitutional reforms, and the great administrative reforms which characterize the XVth century, brought Strassburg to that pitch of prosperity and good government described by Erasmus as "monarchiam absque tyrannide, aristocratiam sine factionibus, democratiam sine tumultu, opes absque luxu, felicitatem absque procacitate."

—The first of these addresses, perhaps also the second, is published also as a "Heft" in the series entitled 'Quellen und Forschungen zur Sprach- und Culturgeschichte der germanischen Völker,' edited by Ten Brink and Scherer, and published in Strassburg by Trübner. The other numbers, so far as published (eight in all), are mostly by Scherer and others upon topics of mediæval German literature: No. 5 is "Die Vorreden Friedrichs des Grossen zur 'Histoire de mon temps,'" by Wilhelm Wiegand. A somewhat similar series, equally illustrating the literary activity of the German university towns, is published at Basel, in annual numbers, under the title, 'Neujahrsblatt für Basels Jugend.' It has reached already more than fifty numbers, all upon topics connected with the history of the city; No. 51, for example (1873), is entitled "Das Karthäuser Kloster und die Bürgerschaft von Basel," by Prof. Wilhelm Vischer. Other titles, illustrating the varied character of the series, are: (1837) "Erasmus von Roterdam in Basel," by Hagenbach; (1842) "Hans Holbein der Jüngere von Basel," by Burckhardt; (1856) "Die Zünfte und der Rheinische Städte-Bund," by Burckhardt; (1866) "Basels Eintritt in der Schweizerbund," by Frey. No. 50, "Eine Basler Bürger-Familie aus den sechszehnten Jahrhundert," by Prof. Vischer, contains a brief sketch of the municipal history of this city. Its development did not pass through any so democratic stage as Strassburg. Basel was always distinguished for its conservative character; the patrician families retained a larger share of power, and by entering into the Swiss Confederacy in 1501 the free German city was transformed into an aristocratic, federated republic. Another recent publication in the same field deserves to be mentioned—'Notice sur l'origine des magistrats communaux,' by Prof. Vanderkindere of Brussels. This little treatise, of 47 pages, contains an excellent statement of the results of the latest German researches into the origin of mediæval institutions, with especial reference to the institutions of the Low Countries. In regard to the municipal institutions, he chiefly follows the theory of Von Maurer, that they were derived essentially from those of the village communities, and sums up at the close with the opinion that "our communal magistrates of the Middle Age had a double origin and a double character; the *échevins* are the judges of the Frank hundred, the councillors are the administrators of the Germanic mark."

## PRICE ON CURRENCY AND BANKING.*

WE have seldom read a book on the subject of currency with more satisfaction than the one now before us has given, nor have we seen one which Mr. Wendell Phillips and his school would read with more dissatisfaction. A more vigorous and thorough demolition of the numerous fallacies which underlie the popular ideas on the subject could with difficulty be found. Professor Price's style of writing is like that of General Sherman in at least one quality—that of leaving the reader in no doubt as to what he means. It is withal now and then a shade dogmatic—a quality arising from the fact that the author has not the slightest doubt of the absolute correctness and sufficiency of all his views. His creed is that of the extreme orthodox English school, from which he does not tolerate the slightest dissent. At the same time, the merits of the book lie in its destructive rather than its constructive powers; the fallacious notions which beset the subject are exploded in detail, but the work of reconstruction does not go much further than the establishment of the correct notions in place of the incorrect ones. It cannot, therefore, take any high rank as a scientific treatise on money, nor can we suppose that the author intended it should do so. The lamentable state of public opinion on the subject does not arise from mere want of knowledge, but from the prevalence of false and groundless opinions; and the first step toward a clear and correct understanding of the subject must consist in the sweeping away of these opinions. The author's mode of treatment is therefore well adapted to the times, and his work can be read with at least as much profit by Americans as by Englishmen. Indeed, the evidence of an extended reading of American newspapers on his part is very striking, and we strongly suspect that a large share of the stimulus necessary to produce the book was derived in this way.

One general characteristic of this treatise, which may be traced all the way through it, is the absence of every attempt to build anything like a lofty edifice, or to expand into anything which might be stigmatized as theorizing or praised as lofty generalizations. Professor Price does not begin with Robinson Crusoe, but with the actual trade and mining of the present day, some digging gold and selling it, while others are constantly exchanging goods and incurring debts. Confining himself so strictly to the foundations of the subject, he has no general principles to propound for which he does not find ample illustrations in the actual operations of exchange and banking.

Notwithstanding the great merits of the work, and the low altitude and simple architecture of the superstructure which the author erects, we cannot regard it as incapable of decided improvement. One idea which, without being formally enunciated, seems to pervade or underlie a great deal of the reasoning of the book, is that the operations of commerce, in both kind and extent, are absolute and fixed, and that the monetary machinery must accommodate itself to them, but is entirely without influence upon them. Very likely Prof. Price himself would enter a disclaimer against so sweeping a proposition being attributed to him; yet we strongly suspect that in his zeal to combat the current superstitions, which look upon the commerce of the world as at the mercy of a few moneyed institutions, he has now and then tacitly assumed it as the basis of reasoning. On it he bases a proposition which strikes us as the least tenable of any he puts forth—namely, that an inflated circulation of bank-notes payable on demand is a pure absurdity. To combat this proposition with any useful result, we should have to begin by agreeing upon what should be considered an "inflated circulation of bank-notes," which would almost require a treatise on currency to serve as an introduction to our theme.

The branch of the subject in which we find the greatest room for improvement in treatment, however, is that of the functions and effects of bank deposits, and we conceive that it would have been treated quite differently if the above general proposition had not been lying half-dormant in the author's mind. Among the features presented to us by the current of public thought on the money question, none is more curious than the almost total forgetfulness of the fact that bank-notes and bank deposits are in all essential particulars the very same in their nature and effects—a forgetfulness which seems to affect the economists and the legislators of all countries as much as it does the public. In this country and, we suppose, in all others, when the volume of the circulating medium is reckoned, the bank-notes are always counted in, while the deposits are omitted. Yet both consist of bank credit, that is, of debts due from the bank, payable

* Currency and Banking. By Bonamy Price, Professor of Political Economy in the University of Oxford.' New York: D. Appleton & Co. 1876.

on demand and transferable from hand to hand without limit, and hence used in place of money for the exchange of goods. The only difference is that in the one case the debt is transferred by passing a bank-note, and in the other case by writing or endorsing a check. The commercial effect of increasing or diminishing the amount of either is precisely the same, excepting any slight difference which may arise from the two forms not being used in the same proportions by all classes of the community. There is about as much sense in excluding bank deposits when estimating the volume of the currency as there would be in excluding bills printed on paper of a particular color, which, nevertheless, circulated just like the others, except that they were more used in wholesale than in retail transactions. It is a pity that in place of the terms "circulation" and "deposits" in bank statements, we could not use some terms implying, 1, credits for which notes payable to the bearer on demand are issued, and, 2, credits for which the owner must present his check.

The moral of this is, that barring any limitations imposed by law or by prudence on the amount of deposits which may exist, banks can increase the volume of the currency by simply writing the necessary figures on the left-hand side of the depositor's pass-book, in precisely the same way as if they could issue notes at pleasure. Not only is this fact not brought out by our author, but he speaks as if the powers of each bank in creating currency and indebtedness were absolutely limited by the commercial transactions of its customers, and as if debts could be formed only by buying or selling, apparently overlooking that important class of cases in which artificial debts are created by the simple exchange of evidences of indebtedness between two parties. "Can you loan me a thousand dollars?" says a customer to his banker. If the latter says "no," things remain *in statu quo*. If he says "yes," the customer draws his note for the amount payable in thirty days with interest, while the banker writes the figures 1,000 on the credit sides of the necessary books. The former now goes forth armed to all intents and purposes with a thousand dollars in currency, which would not have been in circulation if the banker had said no, and with which he will outbid some one else in the purchase of a piece of property, and thus increase its price. And whether the banker shall say yes or no is not fixed by any inflexible law, but solely by considerations of prudence; the main question being whether there is any danger that the checks to be drawn upon him during the thirty days following will exceed his ability to pay in legal tender.

The option thus placed in the hands of the banker may be employed so as to have, at least temporarily, the double effect of increasing transactions and of raising prices. This proposition can be combated only by showing that any excess of notes or deposits over a specific demand come back, not simply that the notes may be changed to deposits, or *vice versa*, but that the debt may be paid in gold or legal tender. If only a single bank expands in a city where there are plenty of others, it will speedily be stopped in this way by the excess of checks upon it presented through the clearing-house over those it has to present. But if all the banks expand together, supposing public confidence unabated, they will be stopped only by the rise of prices inducing a demand for gold to export, and this is so slow a process that a considerable general inflation may occur before it stops the expansion. In this country, at the present time, where the legal tender is not gold but paper, the stoppage may be much more sudden, being caused by the diminution of the legal-tender reserve to twenty-five per cent. of the credits payable on demand.

A minor point remains for critical remark. The curious fact is noticed that the supensions of the Bank Act which have been authorized in times of panic, and which allowed the Bank of England to issue notes without limit during those times, have been nugatory except in their moral effect. The law requires that for every note issued above a certain minimum, the bank shall have an equivalent of coin in the Issue Department, and Prof. Price shows that the Bank always had the coin to fulfil this requirement notwithstanding its suspension. But he does not state whether he includes all the coin held by the Bank, including the reserve for depositors, or only that actually made over to the Issue Department. In the former case, his argument would entirely fail, for if the coin held by the Issue Department actually fell below the legal requirement, the act would, we should suppose, be considered as violated.

Notwithstanding a few points on which we dissent, the tone of the book as a whole is eminently healthy, such, in fact, as only a vigorous and well-nourished brain could produce. While totally free from all ornamentation of style, no one who begins reading the book will want to set it aside till he is through with it, and the man must be wise indeed who can read it without some advantage.

## INDIAN MYTHS AND LANGUAGES.*

DR. SAMUEL FARMER JARVIS, in his discourse before the New York Historical Society in 1819, expressed the opinion that "the religion of the Indian tribes of North America had not been viewed with that largeness of observation which is the characteristic of enlightened philosophy." The same criticism might be made to-day, after half a century has passed; but such a treatise as this of Mr. Bancroft's must do much to take away the reproach of American scholarship in the department of aboriginal mythology. Dr. Jarvis's own contribution to the philosophical study of American religions was of no slight value, and the same may be said of Mr. E. G. Squier's dissertation on the 'Serpent Symbol in America,' and of Dr. J. G. Müller's voluminous German work on the 'American Primitive Religions.' But, unless we except Dr. D. G. Brinton's 'Myths of the New World,' nothing has appeared in this department of American anthropology so broad and thorough, and so crowded with authentic details, as this treatise of Mr. Bancroft's on the mythology of the races of the Pacific States. Although his field embraces only the Western slope of the continent, down to the Isthmus, his contribution to this one department amounts to 550 octavo pages, and is crowded with well-established facts pertaining to the shadowy and uncertain realm of mythological ideas and religious beliefs. The author's method is the same as that which he pursued so strictly in the previous volumes of his work—namely, to give all the ascertainable facts, and to leave to others the construction of theories by which to explain them. "There never was a myth without a meaning," he says; but to discuss the meanings of the myths which he places on record, or the significance of the religious rites which he describes—except incidentally and of necessity—is no part of the task he has allotted to himself. But his work is none the less interesting to the general reader, and certainly none the less valuable to the student of the subject who has not the time to explore the original authorities, or cannot resort to the vast collection of books of which Mr. Bancroft is the happy owner. The divisions he makes are as follows: I. Origin and End of Things; II. Physical Myths; III. Animal Myths; IV. Gods, Supernatural Beings, and Worship; V. The Future State. Among the most noticeable parts of the book are (1) the account of the *Popol Vuh*, the sacred book of the Quichés, from which he copies the Quiché creation-myth at considerable length; (2) the description of the Mexican pantheon and the Mexican religion and ritual, with various aboriginal prayers in full; and (3) the consideration of the question of phallic worship. In respect to this last-mentioned subject, Mr. Bancroft holds a position midway between Mr. Squier and Dr. Brinton. He gives in full Dr. Brinton's protest, but adds: "With his statement that the proofs of a recognition of the fecundating principle in nature by the Americans are 'altogether wanting' I cannot agree." The thoroughness with which Mr. Bancroft has done his work is attested (as in the previous volumes) by the numerous foot-notes, particularly by the bibliographical notes in reference to the *Popol Vuh* (pp. 42–44), and to Father Sahagun and his 'Historia' (pp. 231–236).

Of the second part of the volume, relating to languages, there are more readers who are in a position to form a critical estimate than of the first. This class of persons will hardly feel that the author has made in these pages a very valuable contribution to linguistics, yet because of his fidelity to his own method they will find very little to complain of. Evidently Mr. Bancroft is not a master in philological science; but as he avoids all parade of learning, and confines himself closely to the business in hand—namely, the reporting of facts—this philological division of his work compares very well with the rest of it. It is a division, however, which some of those who set out to read the whole five volumes—if in these busy days there should be any such persons—will be tempted to "skip," for the simple reason that much of it is literally unreadable. For any one except the most devoted philologue, tables of cacophonous nouns, paradigms of outlandish verbs, and paternosters which can neither be parsed nor pronounced, are not very attractive reading, unless, indeed, the reader be captivated—as well he might be—by the discovery that these seemingly uncouth tongues are under the dominion of law equally with the most refined Indo-European languages, and are constructed on a symmetrical and beautiful plan. This fact, of which so many intelligent persons are totally ignorant, Mr. Bancroft's treatise will do much to render obvious; and it will also do much to dissipate popular ignorance with reference to the number of the American tongues. It is no uncommon thing, even in intellgent circles, to hear of "the Indian language," as if there were only one such language spoken by all the aborigines. But Mr. Bancroft's tabulated list of the languages of the

* 'The Native Races of the Pacific States of North America. By Hubert Howe Bancroft. Vol. III. Myths and Languages.' New York: D. Appleton & Co. 1875.

Pacific Slope occupies eleven pages, and contains more than six hundred distinct names. "These languages," he says, "resemble one another too slightly to be called dialects, and in the majority of cases no affiliations of any kind can be traced." This last statement is, to say the least, a very loose one; but the book, as a whole, brings out very plainly the multiplicity of the American tongues. "I may safely assert," he says on p. 553, "that on no other continent can there be found such a multitude of distinct languages which definitely approach one another in scarcely a single word or syllable."

One of the most marked characteristics of the American languages is the constant occurrence of long words. This is the natural result of the synthetic character which they possess in common. In expressing an idea, the Indian does not analyze it as the Anglo-Saxon does, but pursues the opposite course: he throws it as nearly as possible into a single word. To this there is one striking exception—the language of the Otomis; and it is certainly a strange phenomenon that of two languages in close juxtaposition—the Otomi and the Aztec—one should possess such tremendous words as "mihuiittilmoyoiccuitlatonpicixochitl" (the name of a plant) and the other should be as strictly monosyllabic as the Chinese. To the Aztec language more space is given than to any other, for the excellent reason that it was the language of a comparatively cultivated people, and possesses a larger literature and more abundant grammatical materials than any other language of Western America.

In both divisions of this volume there are many items of information which will engage the attention of those who have become familiar with the "comparative" method of study. It is easy, with this mass of facts before us, to trace resemblances and differences between one American myth and another, and between American and Old-World religions. There is also (on pp. 560, 561) an interesting list of words which are common to some American language and the Indo-European stock. It is on such lists that empirics in ethnology base their astonishing theories of the origin and migrations of the American races, but Mr. Bancroft of course recognizes such resemblances as fortuitous.

We notice in the volume some instances of careless proof-reading. On p. 2, we find "Aristotelean"; and on p. 6, "Heroditus." The adjective by which is designated the Indo-European family of languages is sometimes written "Arian" and sometimes "Aryan." Since the word in its first form is theological, and has a recognized place in the history of dogma, why not make the philological term uniformly "Aryan"? The variation, however, is pardonable; for, strange to say, the word is not found in the standard dictionaries. Does it not show a lack of enterprise amongst the lexicographers and their publishers that neither Worcester nor Webster should give a place to a word so well-known and so linguistic as "Aryan"?

---

*Art Foliage, for Sculpture and Decoration;* with an Analysis of Geometric Forms and Studies from Nature of Buds, Leaves, Flowers, and Fruit. By James K. Colling, F.R.I.B.A. First American from the latest English edition. (Boston: James R. Osgood & Co.)—Mr. Colling's book is divided into three parts, which treat of "Analysis of Form," "Art Foliage," and "Natural Examples" respectively. The subject is a very delightful one, and, were it handled by a man of discriminating perception and feeling for the finest qualities of organic form, would be useful and important as an aid to art instruction in these days, when merely kaleidoscopic variations upon geometric figures and formally symmetrical arrangements of lifeless plant and animal forms pass for design; but Mr. Colling does not so handle it.

The main faults of the book grow out of the idea that convention in art properly means "arrangement according to certain *rules*" rather than the limitations, as regards complete imitation of nature, imposed by the various conditions of individual thought, feeling, perception, and skill, as well as by the nature of the materials in which designs are wrought and the various purposes which they are intended to serve. This idea of convention—which is an essential defect of much of the recent popular art instruction in England, France, and Germany, as well as in America—finds expression more or less distinctly throughout the text, notwithstanding certain passages which might otherwise seem to indicate the apprehension of truer principle; and it is borne out to the full in the plates, which are supposed to be illustrative of nature, and of design founded upon nature. As a consequence of this idea, Mr. Colling is dogmatic in his statement of what he considers to be rules of art. Thus, on page 7, we find it stated that "in the treatment of foliage for the purposes of art it must, more or less, always be made geometrical, and arranged with symmetry"; on page 36, "The ornamentation of wall surface, whether it be by paint, paper, or carving, should invariably be arranged in a flat manner."

If it be true that "in the treatment of foliage for the purposes of art, it must, more or less, always be made geometrical, and arranged with symmetry," what is to be said of Middle-Age foliate design, which, in all departments of carving, engraving, and MS. illumination, is, with little exception, highly ungeometrical and far from symmetrical in any formal sense? This design is distinctly organic, and full of those departures from formal arrangement which in art, as in nature, express life and action. It is true that geometric figures frequently occur in mediæval design, but it is always in a subordinate way. They are not intended as chief ornament, but as foils to organic design. Thus Giotto has inlaid the Florentine Campanile with colored stones set in the geometric forms of the circle, triangle, square, and their derivatives; but here the *color* is the chief source of beauty. In the carved panels, near the base of the wall, all is organic and changeful. Take, for instance, the vine in the "Drunkenness of Noah," which is a lesson in design worth prolonged study. Mr. Colling admits that irregularities are often valuable in art; but what he says about them, as well as the illustrations which he gives, shows that he does not justly appreciate the function and significance of these departures from geometric regularity. He speaks of nature as being "geometric with *minor* irregularities." But this is true only in regard to *plan*. All organic nature is ungeometric in *elevation*, so to speak, especially in perspective elevation, which presents her utmost loveliness of form. As a specimen of the author's treatment of this part of the subject, the following extract may be given without further comment:

"The principle of irregularity is also that of the picturesque, and all nature is picturesque to a more or less degree. Freedom in design, therefore, is the element of the picturesque, or that which is natural, while symmetry and geometrical regularity is the rule of art. Lines in nature are bent, and what is commonly called 'crooked'; art makes them straight. Curves in nature are often irregular; art regulates them. But if art dispenses entirely with the irregular it becomes stiff and stilted, and no longer natural. No art should be without this element of the picturesque, the irregular, or the natural—no matter what it is called. The mind and eye are quiescent while viewing perfectly geometrical composition—there is a quiet satisfaction that everything is correct and according to rule; but engraft upon it the irregular, and we are at once drawn towards it with very different feelings. It then becomes picturesque. Before, it was a beautiful object, even and uniform; now it is natural, it has variety and freedom, and we look upon it and meditate its character."

As regards the maxim that "ornamentation of wall surface, whether it be by paint, paper, or carving, should invariably be arranged in a flat manner," it need only be said that, if this be true, all ancient and mediæval mural decoration by fresco and mosaic must be considered in bad taste; and it would have been better could walls have been covered with Minton tiles or some other outgrowth of South Kensington art instruction.

Mr. Colling constantly speaks of "adapting" and "applying" natural forms, and gives detailed suggestions as to the various points which should be "considered" in "adapting" nature to the purposes of design—not infrequently saying good and true things, but always quite failing to appreciate the fact that inventive faculty will enable a man to work in perfect obedience to all true laws of design without reference to precepts, and that precepts, even where they are infallibly true and specific enough to reach every principle involved, would never enable a man who had not designing faculty to invent the least beautiful thing. Precepts and suggestions, however, though they will not make designers, may, if they are wise, be helpful in aiding many to apprehend and enjoy design. And it is to be regretted, therefore, when a work of this nature fails so extensively to inculcate true principles.

---

*Poets and Novelists:* A Series of Literary Studies. By George Barnett Smith. (New York: Appletons. 1875.)—These essays are marked as having originally appeared in various periodicals—the *Edinburgh, New Quarterly, Fortnightly,* and *Contemporary Reviews,* and the *Cornhill Magazine.* The information is valuable, for we should never have supposed that Mr. Barnett Smith's "literary studies" had been ushered into the world by these illustrious journals. They treat of Thackeray, Mrs. Browning, Peacock the novelist, Hawthorne, the Misses Brontë, Fielding, and Robert Buchanan. Of Thackeray Mr. Smith tells us that "his mode of narrative consists in a series of pictures after the manner of Hogarth." He goes on to say that Pendennis's "love-passages with Miss Fotheringay are naïvely related," and that the young man's university career "is described with no sparing pen." "The subjectiveness of Thackeray," Mr. Smith pursues, "is another quality which has greatly enhanced the value of his works"; and he adds that, "leading out of his subjectiveness, or, rather, being a broader and grander development of it, we come to his humanity. That is the crown and glory of his work. And yet this man,

who was sensitive almost beyond parallel, was charged with having no heart! . . . So superficial are the judgments of the world!" The author concludes with a compliment to Thackeray's style. "To the faithfulness with which he spake the English tongue we believe future generations will testify." This last is surely ambiguous. For future generations the English tongue will probably have greatly changed, and we should say that the testimony of Thackeray's own generation as to the way he "spake" it was the more valuable. But the error is perhaps slighter than to discover that Thackeray's narrative is like a series of pictures by Hogarth, or that the episode of Miss Fotheringay is "naïvely" related. Satirists are not usually remarkable for their naïveté, and if ever a man had little of this virginity of perception we should say it was the world-worn creator of the Pendennises and Costigans. For Mrs. Browning Mr. Smith has a boundless admiration. He devotes some space to considering the question whether it better describes her to say that she is "Tennyson's sister" or "Shakspere's daughter." It is impossible to withhold the suggestion that it might do to try "Wordsworth's niece" or "Swinburne's aunt." There was a chance to say a great many discriminating things about Mrs. Browning, but Mr. Smith has utterly missed it. It would have been interesting to point out the singularly intimate union of her merits and defects, to show how her laxity and impurity of style is constantly vitiating her felicity of thought. Mrs. Browning possessed the real poetic heat in a high degree; but it is not too much to say that her sense of the poetic form was an absolute muddle. Mr. Smith, however, has no eye for the niceties of diction (his own is often decidedly erratic), and he swallows everything whole. "And Burns, with pungent passionings set in his eyes," and "poor, proud Byron, sad as the grave and salt as life"—Mr. Smith thinks those are "excellent touches." In discussing the "Romaunt of Margret" and "Isobel's Child," he might have found something to say about that unwholesome taste, so characteristic of his author, which found a pathos in playing tricks with the spelling of proper names. With regard to another of Mrs. Browning's poems, he remarks that "the poet who loves Lady Geraldine has many excellences, but his vocation has not properly imbued him with the kingly spirit." "The character of the Earl," on the other hand, "is well drawn, his natural dignity being admirably caught in the few lines devoted to his limning." Mrs. Browning's sonnets Mr. Smith thinks "certainly equal to any of Wordsworth's and most of Milton's." Of "Aurora Leigh" he says that "it is a poem which one could imagine Shakspere dropping a tear over for its humanity"; and, again, with his high relish for "intense subjectivity," he remarks that that of the work in question "will exempt its influence on men from decay." Mr. Smith has much to say about Peacock's novels—for instance, that as regards one of them, in which the author has been less successful than in the others, "after the feast of sparkling wines and choice viands which he has again and again placed before us, the palate remains comparatively unexcited and unsatiated with this specimen of intellectual catering." There are many pages upon Hawthorne, from which we cull this allusion to one of the most exquisite of his tales: "The search for the 'Great Carbuncle' has much amusement, notwithstanding it is open to the charge of wild extravagance." To reproach Hawthorne for his "extravagance" is almost as odd as to compliment him on his comicality. From the article on "The Brontës" we learn that the author of 'Jane Eyre' was as "strong and brave as a lion"; that Rochester in that novel was a "Jupiter of rugged strength and passion"; that the situations in the tale are "very vivid: several scenes being depicted which it would be impossible to eradicate from the memory after the most extensive reading of serial literature": and that Emily Brontë "has this distinction, at any rate, that she has written a book which stands as completely alone in the language as does the 'Paradise Lost' or the 'Pilgrim's Progress.'" This is high praise for the crude and morbid story of 'Wuthering Heights,' and Mr. Smith may well say that "this, of itself, setting aside subject and construction, is no mean eminence." He devotes fifty-eight pages of eulogy to Robert Buchanan, in the course of which he makes the somewhat puzzling enquiry—"What would he give, for instance, for the details relative to the *personnel* of Homer and Shakspere, if written by themselves?" What is Mr. Smith's notion of the meaning of the word *personnel?* We have heard of the *personnel* of a hotel, of a theatre, of a fire-company, but never yet of a poet. Mr. Smith says in his preface that he has collected his essays in compliance with the importunities of his friends. He would have done better bravely to make up his mind to seem ill-natured and resist them. He seems to us but scantily furnished with the equipment of a critic.

---

*The Vikings of the Baltic.* A Tale of the North in the Tenth Century. By G. W. Dasent. Vols. I.–III. (London: Chapman & Hall. 1875.)—The author of this work is favorably known to every student of the Icelandic or old Scandinavian literature, he having among other works rendered into English the Younger Edda of Snorri Sturla's son (1842) and two most excellent Icelandic sagas, viz., that of 'Burnt Njal' (in two large vols., 1861) and that of 'Gisli the Outlaw' (1866). The introduction to the great Icelandic-English dictionary by Cleasby and Vigfusson (Oxford, 1874) was also written by him. This last work of Mr. Dasent's is somewhat different in its form, not only from *his* former literary productions, but also from all those touching the saga-literature which have yet appeared in the English tongue. Its subject is especially drawn from the so-called 'Jómsvíkinga-saga' as we find it in the eleventh volume of 'Fornmanna-sögur'; but it is neither a mere translation of this saga, nor an effort to present the historical events contained in it in a form more correct and more in accordance with modern criticism. It is an historical romance, or rather a romantic historical sketch from the Scandinavian Viking life in the latter part of the tenth century.

In the reign of the Danish king Harald Bluetooth there arose a magnificent town, called Jomsburgh, on the south coast of the Baltic, at the mouth of the river Oder. Here Palnatoki, a mighty Danish chief, after having killed the king and thus become disgraced at the royal house at home, founded a republican viking society, called Jomsvikings or the Vikings of Jomsburgh. As this society was founded in order to support and strengthen the vigor and warlike character of the most independent Scandinavians of that time, so the statutes enacted for its existence and development inculcated an almost incredible courage, boldness of spirit, and contempt of death. Women were not admitted into Jomsburgh at all, and nothing but warlike deeds and bravery constituted the occupation of the ten to twelve thousand members of this characteristic viking republic. But after Palnatoki's death, under the administration of Sigvaldi, the son of Earl Strut-Harald, in Denmark, the fundamental law of the society was somewhat slackened, it then being allowed to the vikings, for instance, to marry and admit their wives into the burgh, and this was the cause of many eventful occurrences in the history of the republic. From this time many of the most prominent Jomsvikings are found fighting and cruising upon the Northern waters, not only in quest of fee and fame, but also and especially on adventures of love. Their chieftain Sigvaldi fell in love with a daughter of the Slavonian king, Burislav of Vindland (Pomerania), of whom the Danish king, Svein Harald's son, had just asked a tribute as a token of his submission to the Danish crown. To gain the princess, Sigvaldi has to free King Burislav from paying the Danish tribute. In this he succeeded by taking King Svein in Denmark by surprise, bringing him as a captive to Jomsburgh, and forcing him to marry another daughter of King Burislav, become his friend, and give up his assumed supremacy of Vindland. So Sigvaldi marries Astrid, the eldest princess of Vindland, and King Svein, Gunnhild, her sister. Soon afterwards, Strut-Harald, Sigvaldi's father and King Svein's liegeman, died, and at his funeral feast King Svein, who in his heart nourished an unquenchable hatred to Sigvaldi for his late victory over him, and feared that the powerful Jomsvikings might be dangerous to his kingdom in Denmark, allured Sigvaldi and the other chieftains of his viking band into making a vow of harrying Norway and killing his deadly enemy, Earl Hakon, the mighty ruler of that country, and bringing it under Danish rule. This was King Svein's way of humbling the overbearing vikings, and he was successful in his plan, for the result of the Jomsvikings' expedition against Norway was the great battle in Hjörungavog (c. 990), where these fierce warriors were defeated and their power broken by Earl Hakon.

Such are the main historical events treated of in 'The Vikings of the Baltic.' We think the work is of much higher value, at least to the general reader, than a mere translation of the 'Jómsvíkinga-saga' could be, for here we find the poetical elements of the original in an embellished form; and, besides this, the author has interspersed his tale with very instructive descriptions—many of which are not found in the original—of almost everything pertaining to the daily life of the Scandinavians in those remote times, and, furthermore, he has added from other Sagas some interesting narratives closely connected with the main facts of his tale. Thus, chaps. xi. and xii. in Vol. II., containing Earl Hakon's visit to the temple in Gudbrand's Dale and the hunt after Rapp, are taken from the story of Burnt Njal (chaps. lxxxviii. and lxxxix.) in a form not very much changed, and chap. xix. in the same volume is for the most part drawn from the 'Færeyinga-saga.' In chap. xvii., Vol. III., we read Earl Hakon's solemn form of taking the supposed strangers into his peace, with which "the handselling of peace" given to the disguised Grettir in 'Grettis-saga' (chap. lxxiii.) should be compared. Upon the whole, Mr. Dasent's work contains a rich store of antiquarian knowledge, greatly

to be commended to every one wishing to enter upon the field of Icelandic Saga-literature. In reference to its relation to the Sagas, it may be compared with such dramatic works of Oehlenschläger as 'Hakon jarl,' 'Kjartan og Gudrun,' etc., and though perhaps lacking somewhat of the creative genius of that celebrated poet, Mr. Dasent never in his 'Vikings' commits the sin of violating the historical contents of the Sagas, for which Oehlenschläger is so much and so justly blamed. As for the form in which the author has told his tale, it may be compared with Ingemann's historical romances or with some of Walter Scott's tales, productions to which Mr. Dasent's is perhaps inferior in poetic beauty, but no doubt superior in antiquarian truthfulness. Much as we like this work, however, we do not coincide with its author in his spelling of Icelandic proper nouns, some of which we find in almost their original dress, while others are somewhat Anglicized, though not according to any systematic rule. In Vol. III., p. 26, we read: "Her mother was Kathleen, a daughter of Rolf the Ganger, begotten in *Iceland* before he left off sea-roving," etc., which cannot be right, because Rolf was never in Iceland. It should finally be noticed that besides the 'Jómsvíkinga-saga,' which Mr. Dasent has followed in his book, there are two others somewhat different from the one first named, not only as to their form, but also as to their contents. One of them is found in the first volume of *Flateyjarbók* (Christiania, 1860); the other was published in a separate volume in Copenhagen (1824).

---

*The Battle of Gettysburg.* By S. P. Bates, LL.D. (Philadelphia: T. H. Davis & Co. 1875.)—The battle of Gettysburg has often been compared to that of Waterloo, but the resemblance is more fancied than real; in a military view there is hardly any similarity beyond the mere fact of an approximate equality in the numbers actually engaged and in the losses, but both were far-reaching in political results. From the 4th of July, 1863, all hope of foreign intervention was at an end, the Confederates gained no action of any consequence, and the Army of Northern Virginia was reduced strictly to the defensive, fighting more to gain honorable terms than with any hope of ultimate victory. The battle thus marks the turning-point of the war, and this alone would give it great prominence independently of its sanguinary character. The work before us contains a little of everything relating to Gettysburg—a narrative of the whole campaign, a biographical sketch of "old John Burns," called by the author "the hero of Gettysburg," various newspaper and other accounts of the experience of residents of the town, a detailed plan of the National Cemetery, with a notice of the ceremonies at its consecration, sundry official documents, including Meade's and Lee's reports, and some of the despatches between Halleck, Meade, and Schenck, and, finally, a list of the Union regiments engaged and the names of the dead interred in the cemetery. It can hardly pretend to take rank as a military criticism. In the opening of the campaign every move on both sides is discovered by the author to show the wonderful foresight of Gen. Hooker; this is carried to such a point that one can hardly repress a smile when it is remembered that this is the same Gen. Hooker who, six weeks before, at Chancellorsville, had made brilliant manœuvres and high-sounding promises, only, when the actual conflict came, to lose his head and narrowly escape losing his whole army. Hooker conducted his march well in the beginning of the Gettysburg campaign, but the Washington authorities were evidently distrustful of him, and seemed to wish an opportunity to relieve him; his undignified and rather insubordinate despatch of June 27 left them no option. Gen. Meade occupies no such bright place in the author's opinion; he is credited with having done his duty as far as his ability went, but is charged with having his army scattered, with failing to examine and appreciate the ground, with slowness and indecision, and with giving ill-defined instructions to his corps commanders. Gen. Lee receives hearty praise as a general; his tactical mistake of fighting an offensive battle seems to have escaped the author, who endeavors to defend Lee from most of the criticisms which have been made upon him; as, for example, his failure to press his advantage on the 1st, the disjointed nature of his attacks upon the 2d, and the blind error of assaulting an impregnable position on the 3d. To most of these criticisms the author finds a sufficient answer in the bravery of our troops, which would, he argues, have produced the same result, no matter what dispositions Lee might have made!

Dr. Bates's narrative of the battle is generally clear, and agrees well with previous accounts and the weight of authority on both sides, but it has not added much to our previous knowledge of the important events. Several minor incidents, such as the experience of the inhabitants of Gettysburg, the circumstances of the death of Reynolds, and notably the dramatic account of the meeting of Imboden and Lee late on the night of July 3, are new and interesting. The principal defect of the book is the lack of good maps; it contains one map of the theatre of operations, and three of the field of battle, giving the positions of the troops on the successive days; of these latter, no two are alike in topographical features, no scales are given, and on two of them the direction of the meridian is omitted. Such defects could easily have been remedied, for the Government has made accurate surveys of the field; these could have been obtained, or, still better, the publishers might have procured a reduced copy of Bachelder's isometric drawing. This most excellent picture has been examined and corrected by all the corps commanders on the Federal side, and shows as much at a glance as it would take chapters to describe; no account of the battle of Gettysburg which aims to be exhaustive is complete without it.

---

*John Todd:* The Story of his Life, told mainly by himself. Compiled and edited by John E. Todd, pastor of the Church of the Redeemer, New Haven, Conn. (New York: Harper & Brothers. 1876. 8vo, pp. 529.)—We do not know whether the present generation of college students know anything of Todd's 'Students' Manual,' a book a good deal read and exercising a good deal of influence some years ago. It is really an excellent work, containing much sound advice, with a strong but not unhealthy flavor of pietism, and, while decidedly "orthodox," not offensively doctrinal. One would not guess it from the stern, dyspeptic-looking New Englander pictured on the frontispiece, but Dr. Todd had a genuine gift for kindly, persuasive addresses to the young, and deserves to be remembered as one who did a good work in his day.

In this life of Dr. Todd a good share of space is devoted to his youth and training, after which comes his pastoral career, which falls essentially into two parts—at Groton and Pittsfield, Massachusetts; for the life at Northampton and Philadelphia, coming between these, was of less peculiar interest. His life at Groton (1827–1833) was a battle. It was the time of the reaction of orthodoxy, under the lead of Dr. Beecher, against the Unitarian movement of the early part of the century. In this reaction Mr. Todd was one of the most active agents, and the chapters which describe his ministry at Groton should be read by those interested in the history of this controversy. It must be confessed that he was by no means inclined to underrate his own success as a controversialist. Such expressions in relation to his preaching as—"It made the natives stare," "It makes the Unitarians awfully cross," "If they did not find it a bitter pill, I am a poor judge of human nature"—occur here on almost every page. The account (p. 152) of the effect produced by his preaching in the Unitarian pulpit in Groton is quite marvellous:

"Behold me, then, on the Sabbath, in a Unitarian pulpit, the minister by my side trembling like a leaf. I went home with him at noon, and sat down to a sumptuous dinner—real Unitarian. . . . In the afternoon his congregation looked still more wild, and as still as if in the presence of death. They never had anything like it. . . . Mr. Gannett never thanked me, but said he should remember my kindness; and I very much mistake if he does *not* remember it for a long time to come."

The life at Pittsfield, where he was settled for thirty years, was a complete contrast to that at Groton, as here he was "transferred to an old and established church, where his duty was not to attack, but to defend, existing things; not to revolutionize, but to conserve; not to draw upon the strength of other churches, but to maintain strength upon which others were constantly drawing" (p. 314). This was, after all, the chief work of his life, and, as his son and biographer believes, that which "he was really best fitted for by his natural tastes and talents." If his life at Groton is a chapter in the ecclesiastical history, that at Pittsfield is no less instructive as a picture of the social and religious life, of New England.

# Fine Arts.

## ART INSTRUCTION IN MASSACHUSETTS.

WE have heretofore on several occasions called attention to the effort making in Massachusetts to establish a system of instruction in art in the high and common schools. This effort has been attended with a success gratifying to its promoters. But the Report of the Boston School Committee,* recently published, confirms doubts, which we have before hinted at, as to the wisdom of the system adopted.

This pamphlet embraces the annual report of the chairman of the committee, Mr. C. C. Perkins, and "Notes and Comments on the Heliotyped Drawings" which accompany it, and which illustrate the system recently established by the General Supervisor of Drawing and State Director of Art Education, Mr. Walter Smith.

We observe in these pages that the phrases "drawing and design," "mechanical drawing," "industrial drawing," and "art education," are used in a confused and uncertain way; the several ideas which they stand for, and their precise relation to each other, not being clearly indicated. In like manner, the illustrations consist of geometric outlines, symmetrical patterns, elaborate drawings of casts, drawings of machinery and building construction, a drawing from a landscape after Turner, etc., etc.

Now, the objects of mechanical drawing and of drawing for purposes of artistic expression are not to be reached by the same processes. They have little in common except the use of the same materials. The training of hand and eye required in each of them demands essentially different methods, and to suppose that good instruction for the one end is equally good for the other indicates a thorough confusion of ideas. It is true that most designers require to know certain mechanical processes, but, *as designers*, they require training of a purely artistic kind, which cannot be provided unless the mechanical element be kept out of it. The great underlying fault of the present Massachusetts State system is that the essentially unmechanical nature of fine art is not clearly apprehended; and the result is, as might be expected in a time when mechanic art is better understood than fine art, that the general drift of the scheme is toward mechanical, rather than artistic, training. Indeed, it has been said in defence of this system—when the mechanical nature of its methods has been pointed out—that it does not aim at higher art instruction, but only at that which relates to art as "applied to industry." But this argument again implies a confusion of thought in those who make use of it. Mechanical drawing has nothing to do with art proper. Art is always a form of individual expression, and, if we would apply "art to industry," we must be careful to use the methods which "art" requires. Art instruction is properly directed towards purely æsthetic culture alone—æsthetic, that is, in the sense of the term which includes a moral element. Such instruction begins by opening the perceptions to visible facts and beauties of nature, and of the works which express human enjoyment of it. And it advances by more full recognition of the value of form and color as language for the expression of those states of feeling and imagination which can be communicated through the sense of sight only. But, looking through this Report, what do we find that might tend toward such culture? It contains little but meaningless formal and mechanical exercises. From the most elementary to the most advanced, there is not an illustration given which is well calculated to convey any true knowledge of nature or any just idea of beauty of form in nature or art.

Plates 1, 2, and 3 represent drawings by children from seven to ten years of age. They consist of formal and meaningless lines, arranged more or less geometrically, and drawn with painful care and neatness. There is not a line in any of them the drawing of which could fix any idea of nature in the child's mind; while, on the contrary, such inorganic patterns as No. 5, Plate 2, serve to place obstacles in the way of perception and feeling which it must be difficult afterwards to overcome. In Plate 4 we have what are called "original designs" by children of the ages of ten and eleven respectively. Though nothing is yet done to awaken interest in nature, or to store the mind with facts and beauties of form, the child is asked to evolve designs out of the depths of his own consciousness. That they are but formal variations of meaningless patterns, which is all the child has been taught to draw, is therefore not to be wondered at. In Plate 5 we have outlines of the cone and cylinder, which would be all very well as exercise in solid geometry, but it serves no proper purpose of elementary art instruction. Plate 6—more meaningless "design." Plate 7—more geometry. Plate 8—formal outlines of ugly patterns. Plates 9, 11, 12, 13, 17, 18, 19, and 34—designs which we may pause again to consider. They are not only entirely geometrical as before, but from beginning to end there is not an expressive line in any of them; nor have they any organic relation of parts. And this is especially worthy of remark when forms like those of vegetation—which should be highly organic—are used. Purely geometric design may often be well enough in subordinate office, but plant form made rigid and symmetrical is an enormity in design. We see by this one reason why geometric drawing forms so constant and conspicuous a feature in this system. For let any geometric figure be symmetrically divided, and into each division let other figures, of any sort whatever, be placed symmetrically, and the result will be in a sense attractive, and will pass, with the undiscerning, for very sufficient design. But if this be design, then the kaleidoscope is the best of designers.

Fig. 1, Plate 11, is a painful instance of the consequence of doing nothing to direct the pupils' attention to the principles of living growth in vegetation. Observe the flower placed upon the end of the leaflet on the left-hand side of each principal group; also, the manner in which the stalk which supports a flower, and that which supports a group of buds, start respectively from the *middle* of the foot-stalk of the upper leaflet. Mr. Smith, in his notes, refers to this plate, and says that in these figures "progress is observable in manipulation and carefulness of workmanship," not seeing that such manipulation and carefulness—where all intelligence and feeling are wanting—are not deserving of praise. Besides such works as these there are designs for lace-work—some of which, by the way, have merit—designs for china decoration, of which No. 2, Plate 28, has some grace as compared with the rest. Plate 21—the drawing from Turner—after making all due allowance for the imperfection of the heliotype, entirely fails to indicate any appreciation of those qualities which make Turner's work valuable. To gain the faculty of appreciating those qualities is the only use in copying, but in this case it is evident that the most superficial qualities were all that the pupil understood. These she has rendered with a meretricious skill of hand which is an unfailing characteristic of the results of this system. These semicircular cloud-forms, and the characterless drawing throughout, are as unlike Turner as anything could possibly be. And the light and shade is wanting in those delicate and gentle transitions for which Turner stands alone. This copy appears to have been made from a photograph of the sepia sketch which is preserved at South Kensington. These original sketches have little of Turner's fine qualities. They were very hastily done, simply to indicate to the engraver how the masses of light and shade were to be disposed in the first mapping out on the plate. Impressions from the finished plates of the "Liber Studiorum" are worth vastly more as examples to the student than these sketches; and impressions from these plates, giving Turner's own etching before the mezzotint was added, are exceedingly instructive and useful to students. These last have the advantage of being sufficiently well rendered by photography, whereas a photograph from the finished plate gives little of the true excellence of the original. Faithful and intelligent copying of these etchings will teach the student much, both as regards the excellence of Turner's design and also as regards discrimination of the functional characteristics of nature. Being in line, they may be measured and traced, and the accuracy of the copy may be thus clearly tested.

Plates 22 and 32 are shaded drawings from solid models. Both illustrate vicious modes of shading with the point. Elaborate point shading is uneconomical in general practice, though useful as occasional exercise. But to produce shades by minute hatching and stippling which is all equally elaborate throughout a drawing, is a painful waste of labor. And so is the method of tinting with evenly-drawn parallel lines. All this laborious execution is meaningless, and it shows that the true function of the point, as distinguished from that of the brush or stump, is not understood. Plate 23 is the best bit of drawing in the series. The execution is simple and expressive. It has considerable truth and precision of line, and the lights are touched in with very true feeling. But the example is a fragment of Moorish ornament, which, though it is a rich specimen of barbaric abstract ornamentation, can do nothing to instruct the student in the principles of organic design. Plate 25—a shaded drawing from a cast of a hand—is noticeable as having less of the usual academic character. The object is represented in a diffused light, and there are no excessive shades in it. But though it is pleasantly moderate in chiaroscuro, it has little solidity. To keep shades pale in drawing white objects is a merit; but to keep them pale and at the same time to mark lights and shades clearly and express solid form perfectly is a much greater merit, and one which pupils should be encouraged to strive for. Plate 30 is a shaded drawing from a flat

* Report of the Committee on Drawing, Boston, 1875.

copy. The only use in flat copies is to illustrate exemplary methods of execution, including choice and arrangement of subject. This copy is not exemplary in any respect; it is quite the reverse. A plan elevation of a thing being unnatural, and intended to serve only a temporary use, does not require to be elaborately shaded. The true form of a capital cannot be expressed unless it be given in full perspective. The representation of lateral perspective in the carved ornament, as it passes around the bell of the capital, while the abacus and neck-moulding are not given in perspective relation to each other, of necessity distorts the forms. When such a plan is called for, a wise regard to economy, as well as good taste, would dictate that it should be executed with the greatest simplicity, The same principle holds in regard to all architectural elevations not in perspective, and in regard to all drawings of machinery. The frequently elaborate shading of such things is one of the most short-sighted modes of wasting human labor connected with modern mechanical processes. A good and finished drawing of a fine capital—in perspective, of course—would be excellent as an example for a student; but labor spent upon a copy like this is wasted. Plate 33 is a shaded drawing from a cast of a bunch of fruit and leaves. A cast from nature like this is wholly unfit to be used as a model. Let plant forms be drawn from nature as they grow, or let casts from the carvings of real designers, who have appreciated and expressed living qualities of vegetation, be used as models, but let it be known that a cast from nature is a dead thing of necessity. All that is essentially beautiful in the growing thing—all action and spring of life—is entirely lost. Let such a model as this be compared with any group of fruit and leafage in the architrave over the Ghiberti gates, for instance, and the difference between an example taken without regard to expression of functional characteristics, and one in which art has illustrated these characteristics with exquisite emphasis, will be apparent.

The character of these illustrations indicates the shortsightedness and inadequacy of the South Kensington system (upon which this Massachusetts system is substantially based)—a system which originated in the mistaken idea that, in the interest of the material ends of industry and commerce, a scheme of art instruction can be devised which, without thorough and distinctively artistic training, may permanently raise the standard of artistic culture and produce a great body of designers. Such a system may succeed in giving to manufactured products a sort of attractiveness which will quickly commend them to the mass of undiscriminating and uncultivated buyers, but it can do nothing for art culture and the improvement of taste. On the contrary, its mechanical character is actively destructive of artistic sense alike in producer and consumer. It not only is not a power for good, it is a vast power for evil. To criticise thus severely work undertaken and carried on in good faith, and with genuine zeal and energy, is not a pleasant task. It might, indeed, seem captious to do so did not these very qualities, combined as they are with want of real intelligence as to the methods and ends of artistic culture, make the prevalence of the system the more dangerous. It would be a real misfortune, not only to art but to manufactures, should the now popular South Kensington system become established through the efforts of its able advocates in the schools of Massachusetts and other States.

*TO TEACHERS.*

HENRY HOLT & CO.,
25 BOND STREET, NEW YORK,

Publish: Freeman's Historical Course, Taine's English Literature, Otto's German and French Courses, Pylodet's French Course, Keetels's German Course, Bain's English Grammar, Siglar's Practical English Grammar, Sewell's Dictation Exercises, The Ordo Classics, and numerous other school-books. Teachers interested may find it worth while to have for reference a copy of Henry Holt & Co.'s Descriptive Catalogue. Correspondence invited.

*Gen. Sullivan* vs. *Geo. Bancroft.*

GENERAL SULLIVAN
NOT A PENSIONER OF LUZERNE.

[*Minister of France at Philadelphia*, 1778-1783.]

With the Reports of the New Hampshire Historical Society vindicating him from the unjustifiable charges made by

GEORGE BANCROFT

In his 'History of the United States.'

In presenting to the public another edition of the vindication of General Sullivan from the charge that he was a pensioner of Luzerne while delegate in 1780 and 1781 to the Continental Congress of New Hampshire, we are glad to present the Report of the Historical Society of that State sustaining the position taken by his descendants and kinsmen, that the charge was not only not proved, but was alike inconsistent with his whole career. 8vo, 73 pp., price 25 cents.

Copies sent free of postage on receipt of price.

*"Atlantic" Portrait of*

LONGFELLOW

WHAT COMPETENT JUDGES SAY OF IT.

*WILLIAM CULLEN BRYANT:* "It is a fine head, and seems to me successful in every respect."

*DR. OLIVER WENDELL HOLMES:* "The author of the 'Psalm of Life' and of 'Resignation' could hardly be more perfectly idealized than as he is here presented to us."

*JOHN G. WHITTIER:* "I shall give it a place in my study with real satisfaction."

*J. T. TROWBRIDGE:* "It is not merely an excellent likeness, it is a *soulful* likeness."

*SAMUEL L. CLEMENS (Mark Twain):* "I think it the perfection of a portrait."

*BAYARD TAYLOR:* "It is one of the most admirable likenesses I have ever seen."

*This portrait is life-size (24 by 30 inches), and no less admirable as a work of art than it is as a likeness. It is worthy to hang in every library and drawing-room in the country. Sold only with the* ATLANTIC MONTHLY *for* 1876. *Price*, $5. *Subscriptions received by*
